v.7

RU'VO IN APU'LIA, a city of southern Italy, province of Bari, and 22 miles west of the city of that name. Pop. (1872) 15,055. It is built upon a rising ground, contains many churches, and two museums of Italo-Grecian vases, and is famous for its potteries. The staple produce is grain, pulse, and dried fruits. R. is the Rubi of Horace.

RUYSDAEL, or RUÏSDAEL, JAKOB, was born at Haarlem. The date of his birth is uncertain; some make it 1625, others 1630 or 1635. It is said that there is a picture by him signed and dated 1645, which makes the last date improbable. He died in 1681. It has been stated, that for some years he directed his attention to the study and practice of surgery, but was advised by his friend Nicholas Berghem to devote his time to painting. In his pictures the trees are excellent in form, the foliage touched with sharpness and precision, and the skies are light and floating. His style of composition is entirely original, and characterized by a certain compactness in the arrangement; the Italian painters have generally groups of trees at the sides, and running out of the picture; in R.'s compositions, they are almost always massed within the picture. R. and Hobbima hold about an equal position—namely, that of the best landscape-painters of the Dutch school; but R. was also equally eminent for his sea-pieces. His etchings, seven in number, are much prized by collectors. Jan van Kessel and Jan Renier de Vries were imitators of Ruysdael. His elder brother, *Salomo* (born *circa* 1613, died 1676), was also a painter of some note.

RUYTER, MICHAEL ADRIAANSZOON VAN, Dutch admiral, was born at Vlissingen in 1607, of poor parents, who sent him to sea as a cabin boy when only eleven years old. He became a warrant officer, and in 1635 rose to be a captain in the Dutch navy. After serving several years in the Indian seas, he was, in 1645, made rear-admiral. He engaged and sunk a piratic Algerine squadron off Sallee in 1647. In 1652, when war broke out between the States and England, then under the Protectorate, he was placed in command of a squadron, and ordered to convoy a large number of merchant-ships. He was met by the English fleet under Sir G. Ayscough off Plymouth, and an engagement took place. Neither of the fleets gained any decisive advantage; but R. succeeded in saving his convoy. In 1653, when a fight of three days took place between the English and Dutch fleets off Portland, R. commanded a division under Van Tromp. The English, under Blake, finally obtained a great victory, taking and destroying 11 Dutch men-of-war and 30 merchantmen. The states-general, in 1659, sent him to assist Denmark against Sweden. He defeated the Swedish fleet, and obtained a title of nobility and a pension from the king of Denmark. In 1664, he fell upon the English factories at Cape Verde, and attempted to seize the island of Barbadoes. As other depredations of the Dutch upon English merchants, as well in the East Indies as on the high seas, were complained of, war was declared against the Dutch. In June 1666, R. and Van Tromp, with 90 sail, engaged the English fleet under Prince Rupert and the Duke of Albemarle. Both sides fought with such obstinacy that the battle lasted four days, and ended without any decisive result. In July, the conflict was renewed, when the English gained a complete victory, destroying above 20 of R.'s men-of-war. In 1667, he destroyed the shipping at Sheerness, sailed up the Medway as far as Chatham, burned several English men-of-war, and effected more towards the conclusion of peace at Breda (1667) than any diplomatist. In 1671, he commanded the Dutch fleet, and fought several battles with the combined English and French fleets, but without decisive results. In 1675, he was sent to the Mediterranean. He fought, off the coast of Sicily, a desperate battle with the French fleet, under the celebrated Admiral Duquesne. Victory declared itself on the side of the French; but R. made good his retreat into the harbor of Syracuse. He had his legs shattered in the engagement, and died of his wounds, April 1676. Europe did justice to his bravery; and Louis XIV. said he could not help regretting the loss of a great man, although an enemy. His death was deeply mourned by his countrymen, and a splendid monument was erected to his memory at Amsterdam.

RY'AN, LOCH. See WIGTOWNSHIRE.

RYBI'NSK, a district town of Great Russia, in the government of Jaroslav, stands on the right bank of the Volga, 418 miles east-south-east of St. Petersburg. It is the great center of the corn trade on the Volga, and, after Nijni Novgorod, is the chief commercial center on that river. The trade of R. consists principally in transhipping and forwarding to the capital the goods brought hither by large vessels up the Volga. For this purpose, upwards of 6000 barges are built here every year. The landing-place extends along the river for several miles, and is divided into nine sections, each of which is appropriated to special varieties of goods. The chief articles of trade are corn, flour, tallow, spirits, metals and timber, and these are forwarded to St. Petersburg by three systems of communications, of which the Mariinsky Canal, conveys goods to the value of £5,000,000; the Tichvin Canal, goods to the value of £4,000,000; and the Vyshnivolotsk Canal, goods to the value of £2,000,000. There is, besides, the railway. Pop. (1880) 15,050.

RYDE, a flourishing and fashionable watering-place and market-town, on the north coast of the Isle of Wight, Hampshire, occupies the east and north slopes of a hill six miles south-south-west of Portsmouth from which it is separated by the roadstead of Spit Head. It consists of Upper and Lower R.; the former anciently called *Rye*, or *La Riche*, and the latter of quite modern construction. The shores are wooded to the verge of the water, and the appearance of the town, with its streets and houses interspersed with trees, is pleasing and picturesque. The pier, nearly a mile in length, forms an excellent promenade. Yacht and boat-building are carried on to some extent. Steamers cross every hour to Portsmouth in summer, and several times a day in winter. R., the largest town in the island, had, in 1881, 11,422 inhabitants. R. is connected with Ventnor by a railway.

RYE, a seaport, market-town, and parliamentary and municipal borough in the south-east of the county of Sussex, ten miles north-east of Hastings. It is charmingly situated on an eminence bounded east by the Rother, and south and west by the Tillingham, which streams unite here, and, entering the sea two miles below the town, form the old harbor. The appearance of the town is remarkably quaint and old-fashioned. Overlooking the junction of the streams is a small castle built by William de Ypres, in the reign of Stephen, and now used as a jail. The church is a beautiful and interesting structure—the central tower, transepts, a number of circular arches, &c., all being early Norman. In former times the sea flowed close up to R., washing the rock on which the Ypres tower stands, but it has retired to a distance of two miles. The harbor admits vessels of 200 tons, and has been recently improved. This ancient town receives historical mention as early as 893. It was walled on two sides by Edward III., and contributed nine ships to the fleet with which that monarch invaded France. Brewing, ship-building, and trade in corn, hops, &c., are carried on. R. is one of the Cinque Ports, and sends a member to parliament. Pop. (1881) of municipal b., 4220; of parl. b., 8409.

RYE (*Secale*), a genus of grasses, allied to Wheat and Barley, and having spikes which generally consist of two-flowered, rarely of three-flowered, spikelets; the florets furnished with terminal awns, only the upper floret stalked. One species (*S. cereale*) is a well-known grain. It has, when in fruit, a roundish-quadrangular spike, with a tough rachis. Its native country, as in the case of the other most important cereals, is somewhat doubtful; but it is said to be found wild in the desert regions near the Caspian Sea, and on the highest mountains of the Crimea. It has long been cultivated as a cereal plant; although the supposed mention of it in Exodus ix. 32 is doubtful, spelt being perhaps intended. It is much cultivated in the north of Europe and in some parts of Asia. Its cultivation does not extend so far north as that of barley; but it grows in regions too cold for wheat, and on soils too poor and sandy for any other grain. Its ripening can also be more confidently reckoned upon in cold regions than that of any other grain. But R. succeeds best, and is most productive, in a climate where wheat still ripens. It delights in sandy soils.

The varieties of R. are numerous, although much less so than those of other important cereals. Some are best fitted for sowing in autumn, others for sowing in spring. The former kinds (*Winter R.*) are most extensively cultivated, being generally the most productive. In some places on the continent of Europe, R. is sown at midsummer, mowed for green fodder in autumn, and left to shoot in spring, which it does at the same time with autumn-sown R., producing a good crop of small but very mealy grain. In Britain, R. is not a common grain crop, and is cultivated to a smaller extent than it formerly was; the sandy soils, to which it is best adapted, being improved and fitted for other kinds of corn. It is, however, sometimes sown to be used as a green crop, for feeding sheep and oxen in winter, and is found particularly good for milch cows. It is sometimes also mown for horses and other animals.—Bread made of R. is much used in the north of Europe. It is of a dark color, more laxative than that made of wheat-flour, and perhaps, rather less nutritious. R. is much used for fermentation and distillation, particularly for the making of *Hollands*. R. affected with Ergot (q. v.) is a very dangerous article of food. The straw of R. is tougher than that of any other corn-plant, and is much valued for straw-plait.—PERENNIAL R. (*S. perenne*) differs from Common R. in having a very hard, red-like culm; ears, 3—5 inches long, flatly compressed, with a brittle rachis, and 50—60 closely imbricated spikelets. It endures for many years, but is not much cultivated, as its grain is slender, and does not yield an easily separable flour.

RYE-GRASS (*Lolium*), a genus of grasses, having a two-rowed, flatly-compressed spike, the spikelets appressed edgewise to the rachis. COMMON R., or PERENNIAL R. (*L. Perenne*), the *Ray-grass* of the older English authors, is frequent on waysides, and

in meadows and pastures, in Britain and on the continent of Europe. The spikelets are much longer than their solitary external glume, 6—8 flowered; the florets awnless or nearly so; the culm flattened, from one foot to three feet high; the root producing leafy barren shoots, which add much to the agricultural value of the grass. This grass is highly valued for forage and hay, and is more extensively sown for these uses than any other grass, not only in Britain, but on the continent of Europe and in North America. It grows well even on very poor soils. The *Common Perennial R.* is the kind most generally cultivated. A kind called

1, Common Rye-grass; 2, Italian Rye-grass.

Annual R.—not really an annual plant, although useful only for one year—is sometimes cultivated; but is, in almost every respect, inferior.—ITALIAN R. (*L. Italicum*, or *L. multiflorum*, or *L. Bouchianum*), a native of the south of Europe is much esteemed as a forage and hay grass. In many soils and situations in Britain it succeeds extremely well, and is remarkable for its verdure and luxuriance in early spring. It is preferred by cattle to the Common Rye-grass. The young leaves are folded up, whilst those of the Common R. are rolled together.—There are many varieties of Rye-grass. It is nowhere so much valued or cultivated as in Britain. It was cultivated in England before the end of the 17th century. Italian R. was introduced into Britain in 1831 by Mr. Thomson of Banchory and Messrs. Lawson and Son of Edinburgh. R. is generally sown along with some kind of corn, and vegetating for the first year amongst the corn, appears in the second year as the proper crop of the field.

RYE'HOUSE PLOT. In 1683, at the same time that a scheme was formed in England among the leading Whigs to raise the nation in arms against Charles II., a subordinate scheme was planned by a few fiercer spirits of the party, including Colonel Rumsey and Lieutenant-colonel Walcot, two military adventurers; Goodenough, under-sheriff of London; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London—the object of which was to waylay and assassinate the king on his return from Newmarket. The deed was to be perpetrated at a farm belonging to Rumboldt, one of the conspirators, called the Ryehouse Farm, whence the plot got its name. The R. P. is supposed to have been kept concealed from Monmouth, Russell, Shaftesbury, and the rest of those who took the lead in the greater conspiracy. It owed its defeat to the circumstance, that the house which the king occupied at Newmarket took fire accidentally, and Charles was thus obliged to leave that place eight days sooner than was expected. Both the greater and lesser conspiracy were discovered before long, and from the connection subsisting between the two, it was difficult altogether to dissever them. The indignation excited by the R. P. was extended to the whole Whig party; Lord Russell, Algernon Sidney, and Lieutenant-colonel Walcot were brought to the block for treason; John Hampden, grandson of his more noted namesake, was fined £40,000; and scarcely one escaped who had been concerned in either plot.

RY'OT (from the Arabic *raaya*, to pasture, to protect, to govern; hence, literally, the governed, a subject) is the vernacular term for a Hindu cultivator or peasant.

RYOTWAR (literally, according to or with ryots) is the term applied to the revenue settlement which is made by the government officers in India with each actual cultivator of the soil for a given term—usually a twelvemonth—at a stipulated money-rent, without the intervention of a third party. This mode of assessment prevails chiefly, though not exclusively, in the Madras presidency. See H. H. Wilson, *Glossary of Judicial and Revenue Terms* (Lond. 1855), under RAIYATWAR.

RYSBRACH, MICHAEL, a sculptor of considerable talent, born at Antwerp in 1693. He settled in London in 1720, and executed numerous works there, in particular the monuments to Sir Isaac Newton, in Westminster Abbey, and to the Duke of Marlborough at Blenheim, a bronze equestrian statue of William III. for the city of Bristol, a colossal statue of George II. for the parade at Greenwich Hospital; a Hercules, and busts of many of the eminent poets, wits, and politicians of his time. Scheemakers, also a native of Antwerp, and Roubilliac, a Frenchman, were contemporaries and rivals of his, and shared with him most of the commissions for works of sculpture in England at the period. With Scheemakers was placed as a pupil Nollekens, who became so distinguished for his busts, and as one of the founders of the English school of sculpture. R. died 8th January 1770.

RY'SWICK, PEACE OF, a treaty concluded in 1697 at Ryswick, a Dutch village between Delft and the Hague, which was signed by France, England, and Spain on September 20, and by Germany on October 30. It put an end to the sanguinary contest in which England had been engaged with France. It has been often said that the only equivalent then received by England for all the treasure she had transmitted to the continent, and all the blood which had been shed there, was an acknowledgment of William's title by the king of France; but it must not be forgot how much the allies were benefited by the check given to the gigantic power and overweening ambition of France.

S.

The nineteenth letter in the English and other western alphabets (the eighteenth in the Latin), belongs to the dental series, and marks the fundamental sound of the hissing or sibilant group, *s*, *z*, *sh*, *zh*. The Sanscrit has characters for three hissing or *s*-sounds; the Shemitic languages had four (see ALPHABET). The Hebrew or Phœnician character, from which the modern *s* is derived, was called *shin*—i. e., tooth, and in its original form probably represented two or three teeth. The same character, with the presence or absence of a diacritic point, marked either *s* or *sh*. In Eng., *s* is used both for the sharp and flat sounds, as *this, those* = *thoze*. The nearness of the *s*-sound to *th* is seen in the Eng. *loves* = *loveth*, and in the phenomenon of lisping *yeth* = *yes*. This seems to furnish the transition to the so frequent interchange of the High-Ger. *s* for the Low-Ger. *t*, as in Ger. *wasser* = *water*; Ger. *fuss* = *foot*. Comp. Gr. *thalassa* = *thalatta*. The substitution of *r* for *s* is noticed under R. In such cases as *melt*, compared with *smelt; pike*, with *spike; lick*, with *sleek;* Ger. *niesen*, with Eng. *sneeze;* Eng. *snow*, Goth. *snaivs*, with Lat. *nix* (gen. *niv*-is); Gr. *mikros*, with *smikros; short*, A.-S. *sceort*, with *curt*—it is difficult to say whether the form with, or that without the *s* is the older. Grimm considers *s* as the remnant of an old prefixed particle (*as, is, us*), having perhaps, the force of *ex* in Lat. *exopto*, I wish greatly; or *ur* in Ger. *urklein*, very small. An initial *s* before a vowel in Lat. corresponds to Gr. *h;* comp. Lat. *sub, sex, sal* (salt), with Gr. *hypo, hex, hals*. In Greek and Latin, *s* was pronounced feebly at the end of words, and still more so between two vowels. It thus frequently disappeared in these positions, and this was one of the chief sources of the irregularities in the declensions and conjugations, which had originally been formed on a uniform system (see INFLECTIONS). The dropping of *s* is one of the ways in which the forms of modern French words have become so degraded; compare Lat. *magister*, old Fr. *maistre*, mod-

ern Fr. *maître; presbyter, prestre, prêtre.* Even where still written, final *s* in French is mostly silent—e. g., *vos, les.*

SAAD-ED-DIN, a Turkish historian, was born in 1536, and died at Constantinople in 1599. His history, entitled the *Taj-al-Tuarikh* (the Crown of Histories), a work held in high estimation by scholars, gives a general account of the Ottoman empire from its commencement in 1299 till 1520; it has never been printed, but MS. copies of it are found in most of the great libraries of Europe, and an inaccurate translation into Italian was published in 1646—1652. S. also wrote the *Selim-Nameh*, or History of Selim I., which is chiefly a collection of anecdotes regarding that prince.

SAA'LÉ, a river of Germany, distinguished from other and smaller rivers of the same name as the Saxon or Thuringian S., rises on the western slope of the Fichtelgebirge (Bavaria), and flowing northwards through several minor states, and finally across the Prussian province of Saxony, falls into the Elbe, about 25 miles above Magdeburg, after a course of 200 miles. It is navigable only within the Prussian dominions.

SAA'RBRÜCKEN, a town of Rhenish Prussia, on the Saar, 40 miles south-south-east of Treves. It is the seat of an active industry, including coal-mining, spinning, the manufacture of cotton fabrics, of iron goods, pottery, and tobacco. Pop. (1880) 9514; but with St. Johann, on the other side of the Saar, 21,860. It was at S. that the French and German armies first met in the war of 1870—1871.

SAA'RDAM. See ZAANDAM.

SAARLOU'IS, a town of Rhenish Prussia, 31 miles south-south-east from Treves, and between four and five miles from the frontier of France. It stands on the left bank of the Saar, a branch of the Moselle, and is a place of some strength, being walled, and containing several forts. It is of considerable importance as a border fortress. There are manufactures of fire-arms in the town, and lead and iron mines in the neighborhood. There are also wire-works. S. was long in the possession of France, and was fortified by Vauban in the reign of Louis XIV. The Congress of Vienna gave it to Prussia in 1815. Pop. (1880) 6789.

SAAZ (Bohemian *Zatec*), a town of Bohemia, on the Eger, 45 miles west-north-west of Prague. Hops and grain are largely cultivated in the vicinity. Pop. (1880) 10,425.

SABADE'LL, a rising manufacturing town of Spain, in Catalonia, 14 miles by railway north-west of Barcelona. It has risen into importance only within recent years, and it is now the Manchester of Catalonia. Woollen and cotton fabrics are the staple manufactures, and of the 100 factories in the town, by far the greater number are engaged in these manufactures. Pop. about 16,000.

SABADI'LLA, CEBADILLA, or CEVADILLA (*Asagræa officinalis*, formerly *Helonias officinalis*), a Mexican plant of the natural order *Melanthaceæ*, the seeds of which are employed in medicine, because of properties analogous to those of White Hellebore (*Veratrum album*). The plant has a bulbous root, and grows in tufts; the leaves are linear and grassy, about four feet long, and not above a quarter of an inch broad; among them rises a round *scape* (leafless flower-stem), about six feet high, bearing a very dense raceme, a foot and a half long, of small white flowers. The seed-vessels are papery *follicles*, three together; the seeds one, two, or three in each follicle, two or three lines long, winged, and wrinkled. The powdered seeds have been known in medicine since the end of the 16th century. On submitting them to chemical analysis, they are found to consist of fatty matter, two special organic acids, to which the names *Cevadic* and *Veratric* acids have been given; of varieties of resin, yellow coloring matter, gum, and a highly poisonous alkaloid named *Veratria* in combination with gallic acid; and to these constituents, a French chemist, Couerbe, has added a crystalline body named *Sabadilline*.

Notwithstanding its highly poisonous properties, S. is prescribed on many parts of the continent as a vermifuge in cases of tape-worm and ascarides, and it may be administered to an adult in 8 or 10 grain doses, mixed with a little sugar, and a few drops of oil of fennel. In the form of powder, it is sometimes applied to the head to destroy lice, but if the skin be broken, some other remedy should be selected, as absorption to a dangerous extent might ensue. From its stimulating properties, it is usefully employed in the form of tincture (which, however, is not an officinal preparation) as an external application in chronic rheumatism and paralysis, and in cases of nervous palpitation.

The active principle of S., the *Veratria*, in doses of $\frac{1}{12}$th of a grain, gradually increased, and taken thrice a day, has been found very efficacious in acute rheumatism; and applied in the form of ointment, it has been highly recommended in scrofulous diseases of the joints. When prescribed internally, its use should be at once suspended if the patient complain of pain in the throat or stomach, vomiting or diarrhœa. Similar qualities are said to exist in the seeds of *Veratrum Sabadilla*, a native of Mexico and the West Indies, and in some of the species of *Helonias*, natives of the southern parts of North America.

SABÆ'ANS, the supposed descendants of one, two, or three Shebas mentioned in the Bible. Historically, the S. appear chiefly as the inhabitants of Arabia Felix or Yemen (to the north of the present Yemen), the principal city of which was called Saba, and the queen of which is said to have visited Solomon, attracted by the fame of his wisdom. Josephus, however (*Ant.* viii. 6, 5), makes her the queen of Ethiopia (Merŏe), and the modern Abyssinians claim her as their own. Her name, according to their tradition, was Makeda; and her visit to Jerusalem made her not only a proselyte to the religion of Solomon, but she became one of his wives, and had by him a son, Menilek, who afterwards ruled Ethiopia (q. v.). The Arabs, on the other hand, call her Balkis, the earliest name that occurs of a Himyaritic queen; but there is no more historical value to be attached to this tradition than to the innumerable legends that have clustered round her name in connection with the great king.

Numerous passages in Greek and Roman writers, as well as in the Bible, testify to the vast importance of these dwellers in Yemen as a wealthy, widely-extended, and enterprising people, of fine stature and noble bearing. Their chief greatness lay in their traffic, the principal articles of which consisted of gold and perfumes, spice, incense and precious stones, a very small portion of which, however, was of home production, Yemen being only productive in corn, wine, and the like matters of ordinary consumption. But the fact was, that the S. held the key to India, and were the intermediate factors between Egypt and Syria, which again spread the imported wares over Europe; and even when Ptolemy Philadelphus (274 B.C.) had established an Indian emporium in Egypt, the S. still remained the sole monopolists of the Indian trade, being the only navigators who braved the perilous voyage. As in many other respects, they also resembled the Phœnicians in this, that, instead of informing other people of their sources and the tracks of their ships, they told them the most preposterous tales about the countries they visited, and the fearful dangers they encountered; and in regard to most things, endeavored to impress upon the minds of their customers that what they sold them was, if artificial, their own manufacture—if natural products, home growth. Being the principal merchants of those things which the over-refined luxury of late classical times considered as absolute necessities of life, they could not fail to gather enormous riches; e. g., in the 3d c. of the Roman empire, every pound of silk—a material enormous quantities of which were used—that came from Arabia was paid by a pound of silver, at times even of gold.

As a natural consequence, the S. became luxurious, effeminate, and idle. The pictures of them drawn by the classic writers are doubtless exaggerated. The country itself, according to the reports of Greek writers, grew spice-wood to such an extent that its odor caused apoplexy among the inhabitants, and bad smells had to be used to counteract these over-potent influences. The meanest utensils in the houses of these merchant princes were—if we were to credit those writers—wrought in the most cunning fashion, and were of gold and silver; their vases were incrusted with gems, their firewood was cinnamon. Their colonies must, in the nature of things, have extended over immense tracts of Asia—the Ethiopian S. probably being one of the first foreign settlements; yet nothing beyond the vaguest conjectures can be given about them. Regarding their government, Dio Cassius informs us that they had a king, who never was allowed to leave his palace, and that the first child born, after the accession of a new king, into one of a certain number of noble families, was considered the heir-presumptive for the time being. Commerce had also done for them what it did for the Phœnicians—it civilized them, and caused them to carry civilization further; and they stand out among the ancient semi-barbarous Arabs as a commonwealth of high culture. Respecting their religion, see ZABISM. Their language is supposed to have been a Semitic (Arabic) dialect, which, however, is almost entirely lost to us now. Some tablets with Himyaritic inscriptions have been found, but their readings are not quite satisfactorily fixed as yet. See SHEMITIC LANGUAGES, ARABIA.

SA'BBATH (Heb. *Shabbath, Sabbathon*, &c., from *shabath*, to rest; not from *shub*, to return, or *shebah*, seven) designates the seventh day of the week, set aside, in the Old Testament, as a period of cessation from work. Without entering into the question of its origin, i. e., whether it be an institution of pre-Mosaic times—either of 'paradise' or of 'heathenism'—or whether it be purely Mosaic, we shall merely state that, according to our only available source, the Pentateuch, the division of the Week (q. v.) into seven days appears at a very early period; but the celebration of the seventh day as a day consecrated to Jehovah, is first mentioned after the Exodus from Egypt, and seems to have preceded the Sinaitic legislation, which merely confirmed

and invested it with the highest authority. On the occasion of the manna (Ex. xvi. 23), the S. and its solemnity seemed presupposed, and the 'Remember the Sabbath-day' of the Decalogue, further seems to indicate its previous institution. There is no trace of its celebration in the patriarchal times, although the Semitic traditions of the creation, and of the divine completion of it on that day, had undoubtedly marked it early as a special day of sanctity among the Abrahamites. The significance that was superadded to it after the Exodus, i. e., that of being a remembrance of the freedom from bondage, makes it appear likely enough that its first legal promulgation dates, as a Talmudical tradition has it, from Marah, where Moses 'set them laws and rights' (Ex. xv. 25). While it thus on the one hand formed a sort of general human memento of the creation and the Creator of all things as it is characterized in the first redaction of the commandments in Exodus, it became also, on the other hand, a national day of record of the bondage and the liberation from it, a notion prominently brought forward in the second recension of the Decalogue (q. v.) (Deut. v. 15), and the 'rest' that was inculcated for everybody—kindred, strangers, slaves, even animals —received a double meaning. It is in the latter sense also denominated a sign between Jehovah and the generations of Israel (Ex. xxxi. 13): a kind of badge of nationality, a token of the covenant between Jehovah and Israel for ever (Ex. xxxi. 16, cf. Ezek. xx. 12, Neh. ix. 13, &c.).

It is constantly mentioned together with institutions of the same peculiar nature; such as reverencing the sanctuary (Lev. xix. 30), celebrating the feasts of a national character (Hos. ii. 11), keeping the ordinances (Ezek. xlv. 17), &c. And in like manner it was made one of the first obligations for proselytes, as one by which they were 'taking hold of the covenant' (Is. lvi. 6). A few special cases only are furnished by the Pentateuch in explanation of the word 'work' used in the prohibition—lighting a fire, gathering sticks, going out of the camp for the purpose of gathering manna. The violation of this law of rest was, as a crime of high treason against Jehovah, punishable with death; yet cessation from labor was only the negative part of the celebration of the day, which is called, like the other festivals, a 'holy convocation.' It is difficult to decide now what precise meaning is to be attached to these words, as referring to the early periods of Israelitish history, particularly before the institution of the prophets or sacred orators had been fully developed. It may be conjectured that the convocation was a kind of general religious assembly, in which readings and some kind of exposition of the law formed the principal features; and there is indeed a tradition to that effect recorded in the Talmud. Some, however, suppose that it was a festive meeting in honor of Jehovah, and refer to Neh. viii. 9—18 for proof that such a celebration was consistent with Jewish notions of keeping days holy to the Lord. As a further celebration of the day, a special burnt-offering, consisting of two lambs of the first year, with the corresponding meat and drink-offering, besides the ordinary daily sacrifice, was instituted, and the shew-bread was renewed in the sanctuary.

Thus far the Pentateuch on the Sabbath. Turning to the later biblical books of the times before the Exile, we find casual references to it as a day of rest and joy, exalted over the other days of the week, and on which agricultural labors and all things connected with them, such as carrying loads, selling and buying, &c., ceased. No deeper signification seems to have been attached to it yet. Although both Jeremiah and Ezekiel, single it out especially, in common with monotheism and the laws of morality, yet they both rest satisfied with the inculcation of its outward observance, which seems occasionally to have fallen into entire disuse. With the return from the Exile, however, a new phase was inaugurated. It is well known how energetically Nehemia carried out his reformation, or rather the restoration of the primitive laws, as in other respects so with regard to the S.; how he 'testified' against those who were treading wine-presses on the S., and bringing in sheaves, and lading asses, &c., and, further, against those 'men of Tyre' who brought 'all manner of ware, and sold on the Sabbath unto the children of Judah and in Jerusalem.' It is by profaning the S., he urges, that their fathers have caused all the evil and wrath that befell the nation and the city. He had the gates shut from Friday evening to Saturday night, and drove away those merchants who still kept lodging outside, by threats of 'laying hands on them.'

What Nehemiah had reinstituted, seems to have been most rigorously upheld, and in many cases made more binding even than he ever intended it, or, at all events, than the originally promulgated form of his words would seem to imply at first sight. With respect to the S. in particular, we find it not more than 100 years afterwards kept with such severity that the people would not even stir in defence of the city of Jerusalem, stormed by the soldiers of Ptolemy I. on that day. Later still, those who had fled into caves to escape the persecution of Antiochus Epiphanes, allowed themselves to be butchered wholesale, nay, burned alive, without any attempt at flight or resistance; 'because they made a conscience to help themselves for the honor of the most sacred day' (2. Macc. vi. 11).

It was only in consequence of these horrible catastrophes, and in consideration of the probability of the enemy's always choosing the hallowed day for his attacks, and thus gradually rooting out the nation, that fighting in self-defence was allowed; although it appears the enemy was not to be disturbed in his siege works. Yet this relaxation in favor of the defensive appears again to have been abrogated through the influence of the fanatical Chassidaic party. Both Pompey and Herod, it would seem, took advantage of the S. for the preparation of the storm on Jerusalem, relying—and successfully—on the strict observance of that day by their antagonists. The incessant tribulations, however, that followed almost without interruption till the final destruction of the Jewish empire, together with the influence of new schools and views, wrought an immense change. Shammai himself, the austere interpreter of the law, and the so-called antagonist of the milder Hillel, pronounced not only the defensive but the offensive legal and righteous (Sabb. xix. a): as, indeed, in his days, human life was placed, under all circumstances whatsoever, higher than any divine or human precept about the Sabbath. 'The Law,' it is said with regard to the S., was given, according to the Scriptures, like other laws, 'that man should *live by them*,' '*not that he should die through them*' (Tos. Shab. xvi. 5). That Joshua had never stopped in his sieges on the S., was not considered so weighty an argument as the dire and imminent necessity that forced itself upon the military and spiritual leaders of the people, of preserving at all hazards a remnant at least of the fast perishing nation.

It was probably after the Exile that the first attempts at legally fixing, or rather 'fencing about' the divine ordinance in a minute and rigorous manner, were made. As we have seen before, no special definition of the 'work' prohibited—save in a few instances—is to be found in the Old Testament. Whether it was the 'men of the great synagogue,' or the later schools, that promulgated the special precepts and prohibitions—part of which were traced to the legislation on Sinai itself (Oral Law)—is difficult to decide. The Mishna only enumerates thirty-nine principal ('*father-*') works, each of which, again, carries a certain number of minor ('*begotten*') works with it, which are strictly forbidden on the Sabbath. A certain portion of these inhibitions and prohibitions refers to work connected with agriculture and the chase; another to domestic labors generally performed by women (such as spinning, sewing, &c.); another again to trade (of builders, mechanics, laborers, &c.) and the like. One of the most harassing of precepts, and one which had at last to be amended by a number of new enactments, was the prohibition of moving things from one place into another (from public to private localities, and *vice versâ*). The minor prohibitions referred chiefly to things which might easily 'lead' to the violation of the S., such as riding on horseback, climbing trees, &c. The 'Sabbath-day's journey,' or prohibition, based on Ex. xvi. 29, of walking more than the supposed utmost space between the ark and the extreme end of the camp, seems to belong, in the Mishnaic form at least, to the Roman times; the *mil* to which it was limited, and which contains the requisite 2000 yards, being a Roman measure.

However it is to be reconciled with the well-known narrative of Christ's healing on the S.-day, contained in the New Testament, there is absolutely no doubt about the fact that, according to the so-called Pharisaical code—i. e., the Oral Law, the highest and absolute authority of Judaism—the safety of life and limb utterly over-rules not only the S., but even the day of Atonement itself. It is only certain smaller alleviations of momentary pain, such as could not by any chance place the patient in the slightest danger, about which we find some kind of casuistical discussions. Practically—that is, according to the final enactments (see Maimonides Yad Chasaka)—it is not only the regard to life, but to the health and well-being of the patient, that sets all Sabbatical prohibitions at nought. The law of 'rest,' according to the Talmud, applies no more to the case of the sick or those anyhow endangered, than it did with regard to the temple, and all the 'work' therein, which, indeed, was much heavier on S. and feast days than at other times. Another difficulty is found in the words in which Christ refers to the beast that is to be taken out of a pit on a S.; the Jewish law, ordaining, in reality, that it should be aided in its own efforts if it endeavored to get out by itself; if it did not succeed, it should be left there, food being let down to it until the end of the S. (Luke xiv.; Matt. xii. 11; Sabb. 128 b). Could it be that the common people (the Hediots or Idiots—i. e., the untutored in the law) were ignorant of the real scope and purport of the 'Pharisaical' code, and that the argument was directed against their crude notions, as directly opposed to the law as established?—But on this we must not enlarge here. It is also impossible to enter into any of the various ancient and modern ways of looking at the S. in an allegorical and symbolical light, e. g., its being connected by Philo and his school with the planets, the spheres, the number seven and the like mystical notions. Nor

can we follow here those speculations which make out a close parallel between the divine work and rest and human work and rest; and show how well-rounded and entire time itself appears when shaped into a week after the model of the six days of creation, and how man's life is, through it, conformed to that of his Creator.

There can be no doubt about its meaning in the Old Testament. It is intended as a principal testimony of faith in the Creator of the universe. Hence its supreme importance. Though the threatened punishments for S.-breakers never seem to have been carried out to the full during the times of the established commonwealth, in the scheme of Judaism it was placed on a par with the entire body of the Law. He who transgresses the S. is considered legally, according to Maimonides, as one who has set the whole law at defiance, and is to be looked upon in every respect as like a 'worshiper of stars'—i. e., a heathen.

Regarding the development of the positive side of the Sabbatical observance, we have to mention first, that in conformity with the precept making it a day of 'holy assembly,' the synagogue (irrespective of the temple service, its special sacrifices, prayers, and psalms for the day), assembled the faithful on that day within its precincts in every town and hamlet in and out of Palestine before and after the final Exile. A certain portion of the Pentateuch, to which afterwards was added a prophetical pericope, the Haftarah, was read, translated into the vernacular, and expounded homiletically. Special prayers and psalms, in addition to the ordinary slightly-modified service, with special reference to the sanctity of the S., were said and sung, and the rest of the day was devoted to pious meditation, study in the law, and to serenity and joyfulness. Respecting this last point, it must be borne in mind that the day is distinctly called a *day of joy and delight* (e. g., cf. Ps. xcii., Is. lviii. 13, Hos. ii. 11, 13, &c.—the words in Is. translated in the authorized version by 'doing thy pleasure,' in reality mean 'doing thy work;' the Hebrew word in this passage exactly corresponding to our 'affairs,' 'business').

A variety of minor regulations referring to bodily indulgences on that day, abundantly prove—if further proof were needed—its recognized character as a 'feast day' in the natural and general sense of the term, in Judaism. It was to be honored by the wearing of finer garments, by three special meals of the best cheer the house could afford (fish, meat, &c.); and it was considered a particularly meritorious thing on the part of the master of the house to busy himself personally as much as possible with the furnishing of the viands, nay, the fetching of the very wood for the cooking, so as to do as much honor to the 'bride Sabbath' as in him lay. Wine, if the means of the individual would anyhow allow it, was to crown the repast, special blessings being duly pronounced over it with reference to the holy day, both at its coming in and at its going out. From the circle of the family, this custom of welcoming, as it were, the S., and taking leave of it, with the cup of blessing, with lights, and with spice, found its way at an early period into the synagogue, on account of those strangers who, having to stop on their journey during the twenty-four hours, were often lodged and fed in or near the synagogue, and on whose behalf the blessing had to be pronounced generally. Fasting, mourning, mortification of all and every kind, even special supplicatory prayers, are strictly prohibited; but, on the contrary, the number of 'a hundred benedictions,' said at all varieties of enjoyments of the senses, are to be completed on the S., were it even by eating different kinds of fruit, smelling different spices, &c. Those who study hard during the week are to relax somewhat on that day, while those bent on business all week may indulge more freely in their readings; even school children are to be released from hard lessons on that day. Nay, the Friday itself participated in a manner in the solemnity of the Sabbath. Its very name was sunk in 'Eve of Sabbath.'

At an early hour in the afternoon, trumpets were blown from the steps of the temple in Jerusalem; and certain shops, the stopping of whose business required some time, began to close. Again and again the trumpets resounded at certain intervals, and other trades ceased, as, indeed, nothing might even be begun on Friday which could not be finished or stopped at the end of that day: walking also was restricted to a certain extent on Friday, and judgment over life and death was entirely suspended. At last, when the sun disappeared from the horizon—irrespective of the situation of the place, whence a difference arose between the beginning of the S. among the dwellers in valleys or on elevations—the hallowed period commenced, and lasted until three stars were visible in the following evening.

The original formulas, much enlarged in later times, as far as they are to be traced now, of the introductory benediction, as well as the valedictory prayer, both of which we subjoin, show the character and scope of the day in Judaism so fully, that they may stand instead of any further explanation of our own.

1. (Kiddush.) 'Blessed art Thou, O Lord, our God, King of the Universe, who hath sanctified us by His Laws, and hath made us participate in His Grace, and hath, in His Love and in His Mercy, given us the Sabbath, as a remembrance of the creation, as the first day of Holy Convocations, and in memory of the redemption from Egypt; for Thou hast chosen us and sanctified us from all peoples, and hast given unto us Thy holy Sabbath in Love and in Grace. Blessed art Thou, O Lord, who sanctifieth the Sabbath.'

2. (Habdalah.) 'Blessed art Thou, O Lord, our God, King of the Universe, who divided between Holy and Unholy, between Light and Darkness, between Israel and the peoples, between the Sabbath and the six days of creation. Blessed art Thou, O Lord, who divideth between Holy and Unholy.'

The same character of cheerfulness, of happy rest from the toil and turmoil of the world's business; of quiet and peaceful 'return into one's self;' of joyous communion with friends and kindred over good cheer—in short, of mental and bodily relaxation and recreation that strengthens, braces, pacifies, and maketh the heart glad, while the sublime ideas which it symbolizes are recalled to the memory at every step and turn—seems to have prevailed at all times, down to our own, among the Jews. Whatever difference there may be in the peculiar customs respecting the S. among some of the recent sects among them, e. g., the Karaites, the Chassidim, &c. (see JEWISH SECTS), they chiefly refer to the Liturgy (with the one vital exception, that the Karaites entirely abstain from the use of light and fire during the whole of the twenty-four hours), and to some minor points, upon which we cannot dwell here. It is also unnecessary here to go into the special 'superior' or 'mourning' Sabbaths during the year, i. e., those that precede or follow certain festivals or days of humiliation, or such as formerly inaugurated new academical semestres (Kallah), and the like. Suffice it to reiterate that in every class, every age, and every variety of Jews, from first to last, the S. has been absolutely a day of joy and happiness, nay, of dancing, of singing, of eating and drinking, and of luxury. The 'luxus Sabbatarius' of Sidonius Apollinarius has indeed been a reproach to them, as was their supposed over-indulgence in laziness. The thinking minds were, according to Philo and others, more than ever busy on that day with those sacred mysteries of God's revelation to man and his miraculous workings on behalf of the 'chosen' nation; others' hearts were lifted up by prayers, by readings, by earnest exhortations, and by pleasing and instructive homiletics. A dark, fanatical, self-torturing spirit is as foreign to the Jewish S. (which is prolonged as far as possible) as it is foreign to the Mosaic and post-Mosaic legislation, its written and oral laws in general.

The benefits of the institution itself for the individual are, after what we have said of its practice, too self-evident to require further comment. How it connected, on the one hand, the human being with the divine Creator, and, on the other, with his fellow-creatures, brother and stranger, children and slaves, nay, the very beast of burden, the ox and the ass—how, ever recurring, it inculcated with irresistible force pious reverence, fear, and love of God, the sole master of all things—man's time and property included—good-will to all things created; and the absolute equality of all men—need not be urged here. Proudhon has recently treated on it from the national-economy point of view, and he has come to the conclusion, that the proportion of the six days of work to the one of judicious rest, is one of manifest wisdom, and of great blessing to man.

It is necessary here to say a few words with reference to the notion that the S., i. e., the celebration of the seventh day as a day of rest, is an institution common to all or most of the civilized nations of antiquity (Assyrians, Arabs, Egyptians, Greeks, Romans), from whom Moses has also been charged with having borrowed it. There is no more truth in these statements than there is in the often repeated assertion of an ancient S. among the aboriginal savages. The dicta of Philo and Josephus, to the effect that there was no city, either Hellenic or barbarian, and not a single people, to which the custom of the S. had not penetrated, have absurdly enough been taken by some as a proof that the Jews borrowed the custom. If the number seven [six and one] is one to which a peculiar significance attached at a very early period, in connection with the calendar (compare the seven worlds, the seven continents, the seven seas, &c., of the Indian cosmogony), and if the weekly cycle of seven days which goes back to the ante-Mosaic period (see Gen. xxix. 27 *seq.*; vii. 4, 10; viii. 10, 12, &c.), is, probably, the common property of the Semitic races; yet there is a mighty difference between counting time by seven (the ancient Egyptians had, in fact, a ten days' previous to a seven days' cycle), and making the seventh day a 'day of rest and holy convocation,' with reference to the national life of Israel.

There is no special sanctity found attached to the day either with the Egyptians or with the pre-Mohammedan Arabs, who sacrificed on that day in black garments, in a hexagonal black temple, an old bull to Saturn: exactly as they sacrificed a boy on another day of the week, sacred to the planet Jupiter. As for the Greeks, the only authenticated passage we find with reference to the subject, is Hesiod's (*Op. et D.* 770, &c.) reference to the seventh day of the month, sacred to Apollo as other days were

sacred to other gods. Other verses quoted by Clemens Alexandrinus and Eusebius, as from Homer and Hesiod, are proved to be spurious Judæo-Hellenic fabrications. The Roman calendar knows absolutely nothing of a hallowed seventh day.

Thus much on the S. under the 'Old Dispensation.' We have still to consider it in relation to the Christian Church, and to trace the progress of opinion and practice in regard to the observance of the first day of the week, which in this country is frequently styled the Sabbath, or, more definitely, the Christian Sabbath.

It is hardly necessary to observe, that all the discourses of Jesus were addressed to Jewish hearers, subject, like himself, to the Mosaic law. That he is nowhere recorded to have enjoined the observance of the S. has by some been thought significant, but seems to have been natural enough in a case where those he addressed, so far from neglecting the duty, were superstitiously scrupulous in its performance. What his hearers needed and received was the lesson, that, the S. having been intended for human benefit, the duty of observing it ought to give way before the higher duty of effecting that purpose, when the two were in conflict; and that trivial acts demanding no exertion were not to be confounded with that real and exhausting labor which was the thing truly forbidden. (Matt. xii. 1—14; Mark ii. 23—28; iii. 1—6; Luke vi. 6—11 : cf. Hosea, vi. 6; Psal. l. 8—14; li. 16, 17; Is. i. 10—17; Jer. vi. 19, 20; vii. 21—23; 1 Sam. xxi. 6). Some have thought that by making clay on a S. to anoint the eyes of a blind man, and by ordering an invalid, when cured, to carry home his bed on another S., he designed to intimate, if not the present abolition of the S., at least its approaching end.

But others look upon the former of these acts as much too trivial to be confounded with 'servile work,' and the latter as an exceptional case within the scope of the principle above stated. On no occasion does he appear to have sanctioned the performance of real work on the seventh day, unless it was demanded by some higher duty than that of bodily rest.

For several years after the death of Jesus, the Church included none but Jews, and by these the S. and other Mosaic rites continued to be observed as before. It was not till Peter's visit to the centurion Cornelius (41 A.D.) that the Gospel began to be preached to the Gentiles; and when the apostles and elders met at Jerusalem to consider what was to be done with the Gentile brethren, it was decided that no Mosaic burden should be laid upon them beyond abstinence from certain practices, of which working on the S. is not one (Acts xv. 23—29). Nevertheless, the Judaizing party continued in various places to demand more or less conformity to the law on the part of the Gentile converts. This party was strenuously withstood by Paul (q. v.), in whose Epistles the dispute is a subject that frequently recurs. From his letters to the churches of Rome, Galatia, and Colosse, which contained both Jews and Gentiles, we learn that, while the Jews wished the Gentiles to observe the Sabbaths prescribed in the law, the Gentiles were prone to treat the observance of Jewish ceremonies with contempt.

Upon both parties the apostle enjoins mutual forbearance and respect; forbidding the Jew who esteemed one day above another to disturb the Gentile who esteemed every day alike, and ordering the Gentile to refrain from contemning the observances conscientiously performed by his weaker brother the Jew (Rom. xiv.; Col. ii. 11—17). That he never taught the Jewish Christians to abandon the observance of the law, but on the contrary, continued to the end to observe it himself—as appears from Acts xxv. 8; xxviii. 17; Philip. iii. 6—are facts of which different explanations have been given by theologians; some thinking that the law continued binding on the Jews, whether Christians or not, so long as the Temple stood; while most are of opinion that conformity to the rooted notions and habits of that people was tolerated for a time, in order that the diffusion of the Gospel might not be impeded amongst them. In the Eastern churches, where the proportion of Jews was greater than in the West, the S. continued to be observed till the 5th c., when we lose sight of the Ebionites (q. v.), a sect of Judaisers such as Paul withstood—and of the more moderate Ebionitic Nazarines, who, though they conceived it to be their *own* duty to circumcise, keep the S., &c., had no desire to impose the peculiarities of Judaism on the Gentile Christians. Down to the present time, however, S.-keeping and various other Jewish rites continue to be practised along with Christian observances by the Christians of Abyssinia, whose ancestors, it is probable, derived them either (as a tradition among them indicates) from missionaries of the Alexandrian Church, of which many members were Jews, or from expatriated Hebrews who settled in Abyssinia at some much earlier date. In other countries also, many of the Gentile Christians seem to have anciently observed the S., if not by resting the whole day from work, at least by attending on it the religious meetings of their sabbatising Jewish brethren.

Hitherto we have spoken of the observance of *Saturday*, the day of rest prescribed to the Jews, and to which exclusively the name of the S.-day was anciently applied, and still continues to be given by every nation but our own and its offshoots. At what date the Sunday, or first day of the week, began to be generally used by Christians as a stated time for religious meetings, we have no definite information either in the New Testament or in the writings of the Fathers of the Church (q. v.). By none of the Fathers before the 4th c. is it identified with the S., nor is the duty of observing it grounded by them either on the fourth commandment, or on the precept or example of Jesus or his apostles, or on an ante-Mosaic S.-law promulgated to mankind at the creation and continuing in force after the coming of Christ. To the reality of such a law—which many modern Christians have deduced from Gen. ii. 2, 3; iv. 3; vii. 4, 10; viii. 4, 10—12; xxix. 27; l. 10; Ex. xvi. 4—30, and which some (as Bishop Horsley, Serm. 22) regard as an indispensable basis for a Christian S.—it has been objected that the attention of the Gentile converts, who must be supposed to have been ignorant of the law in question, is nowhere found in Scripture to have been directed to it by Paul; that his declarations of their freedom from the observance of days are so general as to apply to every law on that subject, whensoever enacted; that consequently he must either have been unacquainted with a primeval law, or (if not) have regarded it as obsolete under the new dispensation; and lastly, that the Fathers, had they known such a law, would have mentioned it in their writings, instead of vindicating (as Justin, for instance, does in his *Dialogue with Trypho the Jew*) the neglect of S.-keeping by Gentile Christians, on the ground that the S. began with Moses and was not observed by the Patriarchs. By none of the Fathers is any S.-law whatever represented as being in force among the Gentiles.

On what grounds, then, did the Christians observe the first day of the week as a time for religious assemblies?—and how and when did the custom of so distinguishing it begin? To these questions very different answers have been given. According to some theologians, apostolic precept or example is the only conceivable origin of a custom apparently so general as well as early; and of such *example* at least, they find evidence in John xx. 19, 26; Acts ii. 1; xx. 6, 7; 1 Cor. xvi. 1, 2; and Rev. i. 10. But others, doubting or denying the conclusiveness of this scriptural proof, conceive that an adequate explanation may be found in the circumstances of the primitive Church. That the desire which naturally actuates the members of every new and unpopular religious sect to meet frequently for worship, instruction, and mutual encouragement, might very soon lead to the fixing of stated days for that purpose, may be assumed as self-evident; that a weekly day should be chosen, would be a natural result of the Jewish habits of the earliest Christians; and that the day on which their Lord had risen victorious from the grave should be thought fittest for this weekly festival, is precisely what was to be expected in their circumstances. But the resurrection of Jesus is by no means the only reason assigned by the Fathers for the honor which they paid to the Sunday. By Justin (see JUSTINUS), in whose *Apology for the Christians to Antoninus Pius*, ss. 87—89, written between 138 and 150 A. D., the earliest undoubted mention of Sunday meetings in the works of the Fathers occurs, several reasons for holding them *then* are assigned—the first being, that on this day of the week the world and light were created; and the second being the resurrection of Christ.

'We all of us,' says he, 'assemble together on Sunday, because it is the first day in which God changed darkness and matter, and made the world. On the same day, also, Jesus Christ our Saviour rose from the dead; for he was crucified on the day before that of Saturn, and on the day after that of Saturn, which is that of the Sun, he appeared to his apostles and disciples, and taught them what we now submit to your consideration.' To these reasons, Origen (*Seventh Hom. on Exod.*) adds the fact that manna was first given to the Israelites on a Sunday; while subsequent writers adduce various other events, either recorded, or by them imagined, to have occurred on that day. In arguing with Trypho, Justin opposes S.-keeping by Christians, on grounds which would have been retorted by the Jew as condemning equally the observance of a first-day S., had the Sunday at that time been regarded as the S.: from which fact, and the circumstance that in his *Apology* already spoken of, where he professes to give the Emperor Antoninus a full account of the observance of the day, no mention is made of rest from labor as a part of that observance, the inference has been drawn, that, except during the time of divine service, the Christians in this Father's age thought it lawful to follow, and actually did follow, their worldly pursuits on the Sunday. It is true that by Tertullian, who wrote in the latter half of the 2d c., the Christians are described as 'putting off even their business on the Lord's day, lest they might give place to the devil' (*De Orat.* c. 23); an indication, in Neander's opinion (*Church Hist.* i. 409, Bohn's ed.), that now the Jewish law of the S. had begun to be applied to the Lord's day.

But the soundness of this interpretation has been questioned—Dr. Hessey, for instance (*Bampton Lectures*, 1860, p. 63), stating that he can find in it 'nothing Sabbatarian—nothing, in fact, more

than I should have expected, considering that the Church had now become somewhat settled—that, rather than that the duties peculiar to the Lord's day should be neglected, worldly business was put off to another day.' But whatever may have been the opinion and practice of these early Christians in regard to cessation from labor on the Sunday, unquestionably the first law, either ecclesiastical or civil, by which the sabbatical observance of that day is known to have been ordained, is the edict of Constantine, 321 A.D., of which the following is a translation: 'Let all judges, inhabitants of the cities, and artificers, rest on the venerable Sunday. But in the country, husbandmen may freely and lawfully apply to the business of agriculture; since it often happens that the sowing of corn and planting of vines cannot be so advantageously performed on any other day; lest, by neglecting the opportunity, they should lose the benefits which the divine bounty bestows on us' (*Cod.* iii. 12, 3). Before this time, such of the Christian writers as had endeavored, by a mystical style of interpretation, to turn the Mosaic ceremonies to account as sources of moral and religious instruction, had, probably in imitation of Philo (q. v.) (*Works*, iii. 265, Bohn's ed), spiritualized the law of the S. to the effect of representing it as a mystical prohibition to the Christian of evil works during all the days of his life, and a prefiguration of the spiritual repose and enjoyment which is his portion both in this world and in the next.

But in addition to this significance, there now began to be discovered in the Old Testament, foreshadowings of the new Sunday-S.; and Eusebius (q. v.), bishop of Cæsarea, the friend and biographer of Constantine, was able to descry in Ps. xlvi. 5, and lix. 16, prophetic allusions to the *morning* assemblies of Christians on Sundays for worship, and in Psal. xxii. 29 a prefiguration of the weekly celebration of *the Lord's Supper* on that day. Applying Ps. xcii. to the first day of the week, the same writer says that 'the Word by the New Covenant, translated and transferred the feast of the Sabbath to the morning light, and gave us the symbol of true rest—viz., the saving Lord's Day, the first of the light,' &c. From other passages in Eusebius and subsequent writers, it is plain that they meant, not that this transference had been formally ordained by Christ (of which there is no trace in Scripture), but that by rising from the tomb on the first day of the week he had made that day more illustrious than the S., and more worthy to be celebrated by the holding of Christian assemblies for worship than the S. was to be similarly honored by the Jews. About the end of the 4th c., Chrysostom is found similarly expounding Gen. ii. 3, which, in his opinion, shows that already from the beginning God offered us instruction typically, teaching us to dedicate and separate the one day in the circle of the week wholly to employment in things spiritual—thus (as his translator observes) making the S. a *type* of the Lord's Day, and rest *from* bodily, of rest *in* spiritual work. (*Library of the Fathers*, ix. 209.)

It was a natural result of Constantine's law, backed by such interpretations of the Old Testament as these, that, in the words of Dr. Hessey, 'a new era in the history of the Lord's Day now commenced; tendencies towards Sabbatarianism, or confusion of the Christian with the Jewish institution, beginning to manifest themselves. These, however, were slight, until the end of the 5th century, and are traceable chiefly to and in the civil legislation of the period. Afterwards they developed themselves more decidedly; Sabbatarianism became at length systematized, in one of its phases, in the ante-Reformation Church both in England and on the Continent by the later Schoolmen, probably in their desire to lay down exact rules for consciences, and under a fancied necessity of urging the precedent of Jewish enactments in support of Christian holy-days' (p. 20). But it was not till the year 538 that abstinence from agricultural labor on Sunday was recommended, rather than enjoined, by an ecclesiastical authority (the third council of Orleans), and this expressly 'that the people might have more leisure to go to church, and say their prayers;' nor was it till about the end of the 9th c., that the Emperor Leo, 'the Philosopher,' repealed the exemption which it enjoyed under the edict of Constantine (Leo. *Const.* 54). And now, the Lord's Day being thoroughly established by law as a S., the fourth commandment would more than ever be employed by the clergy as a means of persuading to its observance. The entire Decalogue, indeed, had long been used by them as a convenient summary of human duty; and by the later Schoolmen it came to be represented as, to a certain extent,—i. e., so far as it coincided with the law of nature—actually *obligatory* on Christians.

This theory of its binding force, and the notion of the holiness of days, were vigorously opposed by Luther and the other Reformers, who denounced also the excessive multiplication of festivals, and proclaimed that the pardon of sin was not to be secured by their observance, or otherwise than by faith in Christ. (See Luther's *Larger Catechism;* the *Augsburg Confession*, 1530, c. vii.; Calvin's *Institutes*, b. ii. ch. viii. ss. 28—34; and his other writings on the subject, collected by R. Cox in *The Whole Doctrine of Calvin about the Sabbath and the Lord's Day*, Edin. 1860). But, while condemning everything which they viewed as abuses and corruptions, the Reformers never ceased to acknowledge the manifold utility and high importance of the Sunday as a day of rest, worship, and decorous enjoyment. Like the later Fathers and the Schoolmen, also, they recognized in the fourth commandment a useful means of instruction and exhortation; but, as we have said, they utterly rejected it as a law. 'The Ten Commandments,' says Luther, 'do not apply to us Gentiles and Christians, but only to the Jews.' (*On the Ten Commandments.*) 'A law,' says Grotius, 'obliges only those to whom it is given; and to whom the Mosaic law is given, itself declares: "Hear, O Israel."' (*De Jure Belli et Pacis*, lib. i. c. i. s. 16.) He quotes also Deut. iv. 7, and Ps. cxlvii. 19, 20. This is not Antinomianism (q. v.): the Reformers acknowledged their subjection not only to the more perfect law of Christ, but to that universal and perpetual law which Paul (Rom. ii. 14) speaks of as the light to the Gentiles of old, who, 'not having the law, were a law unto themselves, showing the work of the law written in their hearts.' See ETHICS.

The distinction, however, between Moses as a lawgiver and Moses as a teacher, was one very apt to be overlooked by the multitude, and disregarded in popular discourses by the clergy themselves. In England, where the writings of the Reformers were less studied than in Germany, the response after the fourth commandment in the Liturgy (where the Decalogue, adapted to general use by the omission of the words addressing it to the Jews, was inserted in 1552), 'Lord have mercy upon us, and incline our hearts to keep *this law*,' must have greatly tended to instil the belief that this commandment imposed on them the duty of keeping, not a mystical, but a literal Sabbath. Accordingly, in the reign of Elizabeth, it occurred to many conscientious and independent thinkers (as it had previously done to some Protestants in Bohemia), that the fourth commandment required of them the observance, not of the first, but of the specified *seventh* day of the week, and a strict bodily rest as a service then due to God; while others, though convinced that the day had been altered by divine authority, took up the same opinion as to the Scriptural obligation to refrain from work. The former class became numerous enough to make a considerable figure for more than a century in England under the title of 'Sabbatarians'—a word now exchanged for the less ambiguous appellation of 'Seventh-day Baptists.' The other and much larger class were the Puritans (q. v.), who, justly offended by the vices and frivolity of the times, but also soured by persecution, applying to themselves the threats of Jehovah against the profaners of the token of the covenant between him and his chosen people—led astray by the mistranslation of Is. lviii. 13 above noticed—overlooking the incidents in Luke xiv. 1—12—and giving a narrower scope than the Reformers had done to the teaching of Paul—added to Sunday-keeping an austerity by which neither it nor the S.-keeping of the Jews had ever before been marked. (See ASCETICISM.) This great party when predominant for a time in the reign of Charles I., availed themselves of the opportunity to maintain and spread their Sabbatarian opinions, not only in numerous treatises, but through what has proved to be the more lasting and influential means of the *Westminster Confession* and *Catechisms*. (See ASSEMBLY OF DIVINES; CATECHISMS; CREEDS AND CONFESSIONS.)

Chiefly through these formularies was effectually introduced into Scotland that scrupulous abstinence from recreation as well as business on Sunday, which still distinguishes the people. For it is a mistake to suppose that either Sabbatarianism or asceticism was recommended by Knox. Agreeing with the other Reformers, Knox, in setting forth in his *Confession of Faith* (1560) 'the works of the First Table,' says not a word about the Sabbath. This *Confession* and the *Geneva Catechism* were adhered to in Scotland till superseded in 1648 by the Westminster standards of faith. Nor is it only to the British Presbyterians that the opinions and habits of the Puritans have descended; as the colonists of New England they planted in that distant soil the rigid Sabbatarianism, which still survives in Massachusetts and Connecticut, and retains the Jewish peculiarity (which found its chief advocates in Prynne and Shepard, 1655) of being observed from sunset to sunset. In America, too, exists now the principal remnant of the Seventh-day Baptists. (See Rupp's *Relig. Denom. in the United States*, pp. 70—111; Mrs. Davis's *History of the Sabbatarian Churches*, Philad. 1851; and the publications of the American (Seventh-day) Sabbath Tract Society, New York, 1852, &c.) They have nearly disappeared in England, though in the 17th c. so numerous and active as to have called forth replies from Bishop White, Warren, Baxter, Bunyan, Wallis and others.

In Holland, though some English Puritan settlers gave birth to a controversy which, during the greater part of the 17th c., engaged the pens of many of the most eminent divines (among whom were Gomarus, Walæus, Rivetus, Cocceius, and F. Burmann), the principles of the Reformers, favored by Grotius among the laity, ultimately kept their ground, as they have done also in Protestant Germany. Yet in Holland were produced the two

bulkiest defences of Sabbatarianism that have ever been published —one, in Latin, by John Brown, an expatriated Scotchman, who had been minister of Wamphray, entitled *Causa Dei contra Anti-Sabbatarios* (2 vols., Rotter. 1674—1676); and the other, in Dutch, by his friend James Koelman, on *The Controversy, History, and Manner of Observance of the Sabbath and the Lord's Day* (Amst. 1685).

In England the earliest considerable treatise on the Puritan side was the *Sabbathum Veteris et Novi Testamenti* of Dr. Nicolas Bound, a minister in Suffolk (Lond. 1595; 2d ed. 1606). It is written in English, though the title is partly Latin. Many converts were made by it and the similar works of Greenham and Widley, his contemporaries; but till the heterodoxy of the Seventh-day Baptist Brabourne aroused, in 1632, the indignation of the bishops, little noise seems to have been made throughout the nation by the controversy; nor would it, perhaps, have ever attained much prominence, had not Charles I. committed, in 1633, the blunder, and, as the Puritans believed, the gross impiety, of reviving his father's *Declaration concerning Lawful Sports to be used [on Sundays]*. (See SPORTS, BOOK OF.) This the clergy were required by Laud (q. v.) to publish in their churches, and many who refused were punished severely. Hence arose the greatest English controversy about the S., between the High-Church party on the one hand, and the Puritans on the other. Bishop White (*Treatise of the Sabbath-day*, 1635) and Dr. Heylin (q. v.) (*History of the Sabbath*, 1636) took the lead for the former, and were ably supported by Sanderson (*A Sovereign Antidote against Sabbatarian Errors*, 1636), Ironside (*Seven Questions of the Sabbath briefly Disputed*, 1637), Taylor (*Holy Living*, ch. iv. s. 6, and *Ductor Dubitantium*, b. ii. ch. ii. rule 6, ss. 43—62), and Bramhall (*On the Controversies about the Sabbath and the Lord's Day*, in his *Works*, fol. p. 907). On the Puritan side were Henry Burton (*The Lord's Day the Sabbath-day*, 1636), John Ley (*Sunday a Sabbath*, 1641), Hamon L'Estrange (*God's Sabbath before the Law, under the Law, and under the Gospel*, 1641), Richard Bernard (*A Threefold Treatise of the Sabbath*, 1641), William Twisse, prolocutor of the Westminster Assembly (*Of the Morality of the Fourth Commandment as still in force to bind Christians*, 1641), and jointly Cawdrey and Palmer, two members of the same Assembly, in their *Sabbatum Redivivum, or the Christian Sabbath Vindicated* (2 vols. 1645—1652), which is the most elaborate defence of Sabbatarianism in our language.

A still more eminent writer on that side, and one of greater breadth of view, was Dr. John Owen, whose *Exercitations concerning a Day of Sacred Rest* (1671), since prefixed to his *Exposition of Hebrews*, gave, however, some offence to his friends by suggesting that the duration of the religious exercises of the day should be measured by the strength of the worshiper. Since then, the Sabbatarian cause has been maintained by numberless writers, among whom may be mentioned Bishop Hopkins, Willison, Jonathan Edwards, Dwight, Stopford, Macfarlan, and others to be afterwards named; while the opposite side is supported by Baxter, Milton, Barrow, Barclay, Morer, Michaelis, Paley, Evanson, Higgins, &c.

In the first half of the reign of George III., the comparative neglect into which the observance of the Lord's Day had fallen in England aroused the anxiety of its friends, and many efforts were made to bring the people to a better disposition towards it. Paley did excellent service, especially by his chapter on the use of Sabbatical Institutions (*Moral Philosophy*, b. v. ch. vi.); while Bishop Porteus successfully exerted himself to check open indulgence in vicious and unseemly amusements. About the same time, the new 'Evangelical' (q. v.) party began those efforts which it makes for the promotion of a strict observance of Sunday according to the Puritan model. But what, perhaps, had most effect in turning the current of public opinion in that direction was the substitution of the Decade (see DECA) for the Week, and the abolition of public worship, by the National Convention of France in 1793 (see CALENDAR); proceedings which brought to the aid of the pious advocates of the Lord's Day, the political conservatism and anti-Gallican feelings of the British people.

In the next generation, the revival of the study of ancient Christian literature led to fresh advocacy of the Lutheran views concerning the S. and the Lord's Day, by Bishop Kaye (*On Justin Martyr*, 1829). Dr. Whately (*Thoughts on the Sabbath*, 1830), Mr. Bannerman (*The Modern Sabbath Examined*, 1832), and the Oxford 'Tractarians;' while Sabbatarianism had influential advocates in Bishop Mant (*The Christian Sabbath, its Institution and Obligation*, 1830), Dr. Daniel Wilson, afterwards Bishop of Calcutta (*The Divine Authority and Perpetual Obligation of the Lord's Day Asserted*, 1830), and Dr. Ralph Wardlaw (*Discourses on the Sabbath*, 1832)—in support of whose principles was founded in 1831 the London 'Society for Promoting the Due Observance of the Lord's Day, which, aided by similar associations in Scotland and the United States still keeps a jealous watch on behalf of the institution. For 17 years preceding his death in 1849, its most noted member, Sir Andrew Agnew, M.P. for Wigtownshire, fought indefatigably both in and out of the House of Commons for a stricter legal enforcement of rest on Sunday; and though he failed to get his bill passed, the agitation which he headed was not wholly fruitless. The attempts, however, which he and his friends have made to suppress all post-office action on Sunday, all stated conveyance of passengers on railways, and such recreations as walking in public gardens, listening to music in the London parks, and viewing works of nature and art in the national collections, have seemed, even to many friends of the institution, to display more zeal than wisdom or knowledge, and have led to the formation (in 1855) of 'The National Sunday League,'—a society which, while deprecating the conversion of any part of the day into a season for ordinary labor, or for frivolous or vicious amusement, conceives that a more cheerful mode of spending some of its hours is expedient, and that the opening of public gardens, museums, and galleries of art, would promote alike the health and the moral and intellectual elevation of the people.

In France, where the Week was restored by Napoleon I. in 1806, the Sunday has not yet wholly recovered its former status as a day of rest; but efforts have lately been made by both clergymen and laymen to convince the people of the advantage of suspending all but necessary labor upon it. Among the advocates of this reform are Pérennès, Gaume, and Mullois, who, however, discountenance the austerity of the Puritans. In Switzerland, Mellet, the pastor of Yvorne, is the author of a clever treatise on *Sunday and the Sabbath*, of which there is an English translation (Lond. 1856). Bred a Sabbatarian, he was converted to the Dominical view by reading Dwight's Sabbatarian *Discourse on the Perpetuity of the Sabbath*, a doctrine still upheld by the 'evangelical' party in Switzerland.

Of late years the bearing of geological discovery on the interpretation of the Hebrew narrative of the creation, and consequently on the S. controversy, and, in particular, on questions arising out of the discrepance between the two copies of the fourth commandment, has been largely discussed. See GENESIS; DECALOGUE. Into the merits of this and other disputed points it is impossible to enter here; but, in concluding the present historical sketch, it may be allowable to express the satisfaction with which we observe, that notwithstanding the wide diversity of opinion as to the authority of the Lord's Day and the manner in which it may and ought to be spent, almost all agree in esteeming it highly as a civil institution at least, and in wishing to defend it from the intrusion of business as far as the public good will allow.

For additional information and discussion, see (on the Sabbatarian side) Holden's *Christian Sabbath* (Lond. 1825); *Report from the Select Committee of the House of Commons on the Obs. of the Sabbath-day* (Sir A. Agnew's committee), 6th August 1832; Jordan's *Scriptural Views of the Sabbath of God* (Lond. 1848); M'Crie's *Memoirs of Sir A. Agnew* (Edin. 1850); Pirret's *Ethics of the Sabbath* (Edin. 1855); Fairbairn's *Typology of Scripture* (3d ed., Edin. 1857); J. Gilfillan's *Sabbath viewed in the Light of Reason, Revelation, and History, with Sketches of its Literature* (Edin. 1861): and (on the Dominical side) Arnold's *Sermons*, vol. iii. (Lond. 1844), and his *Life* by Stanley, 5th ed. vol. i. p. 364, and vol. ii. p. 206; Neale's *Feasts and Fasts* (Lond. 1845); Sir W. Domville's *Examination of the Six Tests commonly adduced from the New Testament in proof of a Christian Sabbath* (Lond. 1849); Hengstenberg on *The Lord's Day*, translated by J. Martin (Lond. 1853); F. D. Maurice's *Sermons on the Sabbath-day* (Lond. 1853); R. Cox's *Sabbath Laws and Duties* (Edin. 1853); Domville's *Inquiry into the supposed Obligation of the Sabbaths of the Old Testament* (Lond. 1855); *Sunday the Rest from Labor*, by a Christian (Lond. 1856); Dr. W. F. Hook on *The Lord's Day* (Lond. 1856); *Time and Faith* (Lond. 1856); Alford's *Greek Testament with Commentary* (Lond. 1856—1861); F. W. Robertson's *Sermons*, 1st and 2d series (Lond. 1856), Baden Powell's *Christianity without Judaism* (Lond. 1857); Reichel's *Lord's Day not the Sabbath* (Dubl. 1859); W. Logan Fisher's *Hist. of the Institution of the Sabbath-day, its Uses and Abuses*, 2d ed. (Phila. 1859); Dr. J. A. Hessey's *Sunday; its Origin, History, and present Obligation*, being the Bampton Lectures for 1860; and the *Edin. Review* for October 1861, p. 535.

Of the British Seventh-day Baptists the principal works are those of Brabourne (1632), F. Bampfield (1677), Cornthwaite (1740), and Burnside (1825). The Roman Catholic doctrine respecting the Lord's Day, is amply stated in *The Catechism of the Council of Trent* (1567), Part III., pp. 351—357, 391—403 of the English transl. (Lond. 1852). As to all shades of opinion, see R. Cox's *Literature of the Sabbath Question* (2 vols. Edin. 1865). Proudhon's work, above referred to, is entitled *De la Célébration du Dimanche considérée sous les Rapports de l'Hygiène Publique de la, Morale, des Relations de Famille et de Cité* (Paris, 1850).

SABBATHAIS ZWI, one of the most remarkable 'Messiahs' of modern times, the founder of a wide-spread sect of semi-Christians and semi-Jews throughout Europe, Asia, and Africa, was born at Smyrna in 1641. A boy of extraordinary gifts, he had at

the age of 15 already mastered the Talmud, and at 18 was an adept in the mysteries of the Cabbala. Very soon incited by fantastic dreams and more fantastic friends, he declared himself to be the Messiah, who had been sent to shake off the thraldom both of Christianity and Mohammedanism from the Jews, and to convert all humanity. The supreme rabbinical council thereupon excommunicated him. He, however, continued to preach his 'mission' as before. He was now declared an outlaw, and his death was decreed, yet nobody dared to touch him. At last, his expulsion from Smyrna was resolved upon by the municipal authorities.

Four apostles—one of them a reconverted Jew, who had previously turned Christian—followed him on his way to Saloniki, where he arrived in 1659, having gathered a vast number of disciples, mostly wealthy, on his road. His extraordinary personal beauty and his fiery eloquence soon brought the most influential Jewish inhabitants on his side, and his cabbalistic formulas and prayers were adopted into the ritual of their synagogue. Two years later, however, he had to leave Saloniki, where powerful antagonists had risen in the meantime, and went first to Palestine and soon after to Alexandria, accompanied by several thousand disciples. Here his power and influence grew so rapidly, that the revenues of the commonwealth to be founded by the new Messiah, and the ways and means of supporting the wars he was going to wage, were seriously taken into consideration. In 1664, no fewer than 80,000 people belonged to the new empire; and in the following year, the beginning of the Messianic reign within a few months, and the rebuilding of the Temple in the next year, were proclaimed aloud in the streets of Alexandria by S. and six disciples, all clad in white raiments, with garlands on their heads. Somewhat later, he returned to Jerusalem; and the resurrection to take place within six years, and the deposition of the sultan whose crown would be placed upon S.'s head, were proclaimed far and near. Upon this all the Jews of Asia, Africa, and Europe, were divided into two camps.

Those who believed, finding all the predicted signs fulfilled now, sold everything they had in order to get ready-money for their journey to, and final abode in, the new capital, Jerusalem; others, and among them some of the highest spiritual authorities, declared all the pretended Messiah's miracles to be cabbalistic tricks, and himself an impostor. Returned to his native place, Smyrna, he was received with full royal honors. Meanwhile, the attention of the Divan was drawn to this movement, and Mohammed IV., then in Adrianople, ordered the grand vizier to secure the person of S., and to commit him to prison, until the investigations set on foot should be concluded. Two agas, however, returned with their janizaries, without having effected the order, not having dared 'to stretch forth their hand against the sacred man.' He now offered to surrender voluntarily. He was committed as prisoner of state to Kuthajah, where he received visits and deputations from all parts. Being at last brought before the sultan, his courage failed him, and he declared himself to be nothing more than a simple rabbi: it was only his disciples, he averred, who had called him a Messiah. The sultan then proposed to test his 'mission.' Three poisoned arrows were to be shot at him. Did these prove harmless, he, the sultan, would at once range himself under his flag. In speechless terror, S., at the instigation of his Jewish interpreter, now took the turban from the head of some official, and placed it upon his own, thereby indicating, as the interpreter declared, that his sole object had been all along to embrace Islam, and to carry over all the Jews with him. The sultan declared himself satisfied, and honored him with the title of an effendi, giving him an honorary post at the same time.

But, extraordinarily enough, the movement was far from having reached its end. The most wonderful stories were circulated among the believers. A fictitious man was supposed by some to have embraced Islam, while the real Messiah had ascended heavenwards. Others believed that Islam was to form part of the new religion; and S., countenancing this view, converted many Jews to Mohammedanism. Nathan, one of his most enthusiastic disciples, traveled about, and caused strife without end, even sanguinary revolts. Many, however, had turned from him by this time, and the voices of the rabbis and their excommunications began to tell more forcibly. Finally, the grand vizier was persuaded to imprison S. once more, and to send him to Bosnia, where he died in a prison in Belgrade—according to some, in consequence of poison, while according to others he was executed in 1677, ten years after his conversion. It is very difficult to judge correctly of a character like his. Even his worst enemies never had a word to say either against his morality or against the extraordinarily brilliant powers of his mind, and his erudition. Probably, he was a self-deceiver, whose plans were not measured by the means in his hands for their execution. His death, however, was only the signal for the reinforcement of his sect, which even many of his former antagonists now joined, and which now, for the first time, was developed into a proper religious system—that of the Sabbathaites or Sabbathians (Shebsen), the chief apostles being Nehemiah, previously a bitter enemy of S. (1677—1690), and Nehemiah Hajun (1708—1717). The latter taught the dogma of the Trinity as part of the new faith; and it became a principle of this religion to accept and to modify itself to the dominant creed of the country—Islam in the East, Christianity in the West. Remnants of it are still in existence in Poland and Turkey. See JEWISH SECTS.

SABBA'TIA, a genus of plants, of the natural order *Gentianaceæ*, natives of North America. They are small herbaceous plants, some with simple, and some with branched stems. They all contain, like many others of the same order, a pure bitter principle, on account of which they are useful in intermittent fevers and as a tonic. They are much employed in the United States.

SABBA'TICAL YEAR (Heb. *Shenath Shabbathon, Shebiith, Shemittah;* Gr. *Hebdomatikos* or *Sabbatikos eniantos*). There are four special injunctions found respecting the celebration of it in the Pentateuch. The first (Exod. xxiii. 10, *seqq.*) ordains that the land, after being sown, and its fruits reaped for six years, should be left to itself in the seventh, so that the poor, and the beasts of the field should eat its spontaneous growth. The same is to be the case with the vine and olive-yards. The second (Lev. xxv. 2—7) views the hallowed period as a 'Sabbath of rest unto the land'—as a solemnity in honor of Jehovah. It is there further enjoined, that the growth of the seventh year be 'meat' both for proprietor, servants, and strangers; that, in fact, it should be common property. A somewhat new significance, but strictly analogous to the first-named ordinance, is given to the institution in the third passage (Deut. xv. 1—11), in which the creditor is enjoined to release the debts owing to him by his poor brother and neighbor. It has been matter of much dispute whether this 'release' implies the entire giving up of the debt, or a mere respite. The Mishna decides in favor of the former; and such were the effects of the law, carried out in accordance with this view, that it was found necessary utterly to paralyze it by an act called the *Prosbul* (Gr. Prosboulé), passed by Hillel the Great.

The fourth passage (Deut. xxxi. 10—13) contains the command to read, in the solemnity of the year of release in the 'Feast of Tabernacles,' the Law before all the people in holy convocation, men, women, children, and strangers. We need only remark here that the fundamental idea of the sabbatical year is identical with that of the weekly Sabbath itself; see also JUBILEE, the highest exaltation, as it were, of the idea of sabbatical rest. As to the practical working of the institution, we learn that it gave rise repeatedly to famine (1 Macc. vi. 49, 53; Jos. *Ant.* xiv. 16, 2, &c.), and that it was altogether so fraught with practical difficulties, that from the time it is supposed to have been inaugurated—viz., fourteen years after the Israelites' first entry into Palestine (seven years' conquest, and seven years' division of the land), it never seems to have been kept before the Exile. It has erroneously been supposed by some that the slaves were set free in the sabbatical year. The passage in question refers only to the seventh year of the individual slave's service. Like the jubilee, it was proclaimed on the tenth day of the seventh month, at the end of the harvest-time. Reasonable doubts have been expressed regarding the 'possibility' of the Jubilee (q. v.) ever having been kept in reality; yet there is no doubt about the rigor with which the sabbatical year was kept up, after the Exile, to a very late period. Alexander, Cæsar, and the late emperors exempted the Jews from tribute during it. The sabbatical year being one of the 'ordinances attached to the land'—i. e., Palestine only—it ceased with the final overthrow of the Jewish commonwealth.

SABBIONE'TTA or SABBIONETA, a city of Northern Italy, province of Cremona, with 2000 inhabitants. It is situated in a marshy district, which affords abundant fodder and pasturage. It was the capital of a principality given by Napoleon I. to his sister Pauline in 1806, and was a place of some consequence; now it is a decayed city, the population of which is daily decreasing.

SABE'LLIUS, a celebrated African heresiarch of the 3d c. was born probably at Ptolemais in the Pentapolis, where, at all events, his opinions were first promulgated. Nothing is known regarding his life—the few statements current on the subject being of a contradictory and untrustworthy character, and it is generally thought that he did not broach his heresy till shortly before his death—the date of which is also unknown. S. is pronounced by Neander 'the most original and profound thinker among the Monarchians'—i. e., the Unitarians; but unfortunately only a few fragmentary notices of his teaching have been preserved, and these by his theological adversaries. It would appear that he did not reject the Scriptural phraseology used in speaking of the Godhead. 'Father,' 'Son,' and 'Holy Ghost' were sacred and venerable names to him as well as to orthodox Christians; but he was strongly opposed to the ecclesiastical conception of this Trinity, as a Trinity of distinct persons, or subsistences (*hypostases*), which he (like many other persons since) held to be absurd and unthinkable, and argued that what is to be under-

stood is a Trinity of manifestation. The single absolute Divine Essence—the *monas* or 'pure Deity,' unfolds itself in creation and the history of man as a Trinity. His words, as quoted by Athanasius, are: *He monàs platuntheisa gegone trias.*

The 'energy' by which God called into being and sustains the universe is the 'Logos,' after whose image men were created; but when they had fallen from perfection, it became necessary for the 'Logos,' or Divine Energy, to hypostatise itself in a human body, in order to raise and redeem them; hence in the man Christ Jesus dwelt the fulness of the Godhead *bodily;* while the same Divine Energy, operating spiritually and impersonally in the hearts of believers, is the 'Holy Ghost.' This is not, perhaps, so very heretical after all. But, on the other hand, we must not overlook the fact, that S. held these Divine 'manifestations' to be merely temporary, and that after the 'Logos' and the Holy Ghost' had done their work, they would be reabsorbed in the absolute Deity—the *trias* would again resolve itself into the *monas;* or, in the language of St. Paul, that 'God would be all in all.' Epiphanius alleges that S. derived his system from an apocryphal 'gospel to the Egyptians;' and there are (as Neander points out) so many points of resemblance in Sabellianism to both the Alexandrian Jewish theology in general, and the particular gospel referred to, that the statement may be regarded as at least indicating the direction from which proceeded the influences that determined the theosophy of the unknown Pentapolitan. The followers of S. were formally suppressed by the Catholic Church in the 4th c.; but his doctrine, which, divested of its Gnostic and Neo-Platonic phraseology about 'emanation,' and 're-absorption,' &c., is substantially Unitarian, has seldom wanted eminent advocates in any subsequent age of Christianity.—Consult Tillemont's *Memoirs;* Lardner's *Credibility of the Gospel;* and the Church Histories of Mosheim, Neander, and Milman.

SABICU (*Acacia formosa;* see ACACIA), a tree the wood of which is remarkably hard and tough. It is a native of Cuba. The wood is of a dull red color, and close short grain. The wood was used to construct the stairs of the Crystal Palace in Hyde Park in 1851, and 'after six months' use, the steps hardly exhibited any signs of wear.'

SABINE, MAJOR-GENERAL SIR EDWARD, a celebrated British physicist, of Irish extraction, was born in 1790. After serving in the royal artillery for some time, he was promoted to the grade of lieutenant, and accompanied Captain Ross (q. v.) and Lieutenant Parry (q. v.) in their expedition (1819—1820) to the north coast of America (see NORTH-WEST PASSAGE), making during the voyage a series of magnetic observations of great value. These observations formed the substance of two papers which he communicated to the Royal Society on his return. A strong desire of continuing the investigation of this and other branches of experimental physics, prompted him to undertake a series of voyages to places between the equator and the north pole, making at each point observations on the length of the seconds pendulum, and on the dip and intensity of the magnetic needle. The fruits of these labors were of high importance, and were published, along with other information, in 1825.

From this period, his history is that of a studious investigator into the laws and phenomena of nature, broken only by a short term of military service in Ireland, during which he rose to the rank of major. In 1836 he communicated to the British Association at Bristol his observations on the declination and intensity of the magnetic force in Scotland; and to the same association, he delivered, at Liverpool, in 1837, a report on the variations of magnetic intensity at different parts of the earth's surface. The rest of his researches into the nature and action of magnetic force will be found in detail in the *Transactions* of the above-mentioned association, of the Royal Society, and in the *Philosophical Transactions.* His labors have led to the discovery of the laws of 'magnetic storms,' of the connection between certain magnetic phenomena and the changes of the solar spots, and of the magnetic action (independently of heat) of the sun and moon on the earth. He deserves almost the sole credit of extending the body of known facts in magnetic science by the establishment of magnetic observatories in all parts of the world, and by the collation of the enormous mass of facts thus acquired. In 1818, S. was elected a Fellow of the Royal Society; in 1850, he became its Vice-president and Treasurer, and in 1861, its President. He was for 21 years one of the general secretaries, and for 8 years sole general secretary of the British Association, and filled the office of President in 1852. In 1856, he was raised to the rank of major-general; in 1869 he was created a Knight-Commander of the Bath; and in 1875 a corresponding member of the French Academy.

SABI'NE, a river of the United States of America, rises in the N.E. part of Texas, and flows S.E. 250 m. to the eastern boundary of Texas, whence flowing southerly, it forms the eastern boundary, and empties itself through Sabine Bay, 18 miles long by 9 miles wide, into the Gulf of Mexico. The S. is 500 miles long, but shallow and unnavigable.

SABI'NI, an ancient people of Central Italy, whose territory lay to the north-east of Rome. The boundaries of the territory cannot be determined with exactness, but it appears to have extended from the sources of the Nar, on the borders of Picenum, as far south as the Anio. The nations conterminous to the S. were the Umbrians on the north, the Umbrians and Etruscans on the west, the Latins and Æqui on the south, and the Marsi and Picentini on the east. The entire length of the Sabine territory did not exceed 85 miles, reckoning from the lofty and rugged group of the Apennines, anciently known as the *Mons Fiscellus* (now *Monti della Sibilla*), to Fidenæ on the Tiber, which is not more than 5 miles from Rome. The principal towns were Reate, Interocrea, Falacrinum, Nursia, Amiternum, Casperia, and Cures, but none of these places were of any size or political importance. The inhabitants had no inducements to congregate in large towns. Their country was an interior region; much of it, especially in the north, very mountainous and bleak, though the valleys were (and are) often richly productive; and thus cut off from the seaboard, and even from that easy access to their neighbors which lowland districts admit of, they (like all the other races who peopled the sequestered regions of the Apennines) scarcely advanced beyond the rude simplicity of their primitive highland hamlets.

The Sabines were a brave, stern, religious race, whose virtues were all of an austere and homely character. Cicero speaks of them as *severissimi homines*, and Livy notes the *disciplina tetrica ac tristis veterum Sabinorum* ('the stern and grave discipline of the old Sabines'), while the poets of the Empire—Horace, Virgil, Juvenal, &c., are fond of contrasting their simple uncontaminated modes of life with the vicious luxury and dissipation of the capital. What part, if any, they had in the foundation of the city of Rome, cannot now be ascertained, as the whole story of the Ramnes, Tities, and Luceres has come down to us in a purely mythical form (see ROME). Their native tutelary deity was 'Sancus,' or 'Semo-Sancus' = Lat. *Sanctus*, the 'Holy' or 'Venerable;' but like the other Latino-Sabellian races, they also worshiped Jove, Mars, Minerva, Sol, &c. That the S. were an ancient people in Italy, is certain. They were probably most nearly allied to the Umbrians, whose tutelary god was also 'Semo-Sancus;' and, in fact, they are generally considered an offshoot of that people; but they themselves, on the other hand, became so numerous that they were obliged to send forth numerous colonies, who founded new nations to the south and east, the Picentes, Peligni, Samnites (q. v.) &c.; while the Samnites (a name essentially the same as *Sabini;* the Greek form *Saunitai* = *Sav-nitæ* = Oscan name *Safini* or *Sabini*) in their turn became the progenitors of the Lucanians, Campanians, and Bruttii. Hence the epithet, *Umbro-Sabellian*, in use among classical ethnologists, to denote the whole of these kindred races, who were also allied, but less closely, to the Latins (see LATINI) and Oscans (see OSCI).

Of the Sabine language, only a few words remain, which, however, seem to indicate that it differed from the Latin only dialectically: thus, Lat. *hircus*, Sab. *fircus;* Lat. *hostis*, Sab. *fostis*, &c.; analogous to the Aberdeen *filk* for 'whilk,' *fat* for 'what,' &c. For further information, see ROME. HISTORY OF.

SABLE (*Martes zibellina*), a species of Marten (q. v.), so nearly allied to the Common Marten and Pine Marten, that it is difficult to state satisfactory specific distinctions. The feet are covered with fur, even on the soles, and the tail is perhaps more

Sable (*Martes zibellina*).

bushy than in the British martens. The length exclusive of the tail, is about 18 inches. The fur is brown, grayish-yellow on the throat, and small grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very highest value, an ordinary S. skin being worth six or seven pounds, and one of the finest quality fifteen pounds. The fur attains its highest perfection in the beginning of winter, and the pursuit of the S. at that season is one of the most difficult and adventurous of enterprises. The S. is a native of Siberia, widely distributed over that country, and found in its coldest regions, at

least wherever forests extend. The progress of geographical discovery in the eastern parts of Siberia has been much indebted to the expeditions of the hardy and daring S.-hunters, exploring new regions at the worst seasons of the year, and spending dreary months at a great distance from all human abodes. The S. is taken by traps, which are a kind of pitfall, it being necessary to avoid injury to the fur, or by tracking it through the snow to its hole, and placing a net over the mouth of the hole. It is a very wary animal, and not easily captured. It makes its nest in a hollow tree, or sometimes, it is said, by burrowing in the ground, and lines it with moss, leaves and grass. From this it issues to prey on hares and smaller animals of almost any kind, its agility enabling it even to catch birds among the branches of trees. It is ready, when food is scarce, to eat the remains of an animal on which a larger beast of prey has feasted, and is said even to satisfy its hunger with berries in winter, when animal food is not to be had.

SABLE, one of the tinctures in Heraldry, implying black. In heraldic engravings, it is represented by perpendicular and horizontal lines crossing each other.

SABLE ISLAND. See NOVA SCOTIA.

SABLES D'OLONNE, LES, a seaport of France, in the dep. of Vendée. It owes its early importance to Louis XI., who excavated the port, and raised the fortifications. In 1688, its merchant marine was more important than that of either Nantes or Rochelle. The commerce is in grain, wines, cattle, fish (sardines), salt, &c. Pop. (1876) 9188, who are almost all engaged in a seafaring line of life.

SABOTS, a species of wooden shoes much used by the French and Belgian peasantry, especially by those who inhabit moist and marshy districts, as an effectual protective of the feet from external moisture. The fabrication of sabots forms an important branch of French industry, and is chiefly carried on in the deps. of Aisne, Aube, Maine-et-Loire, and Vosges. After being made, they are subjected to the smoke of burning-wood, till they acquire that reddish color so much prized in certain countries.

SABRE, a heavy sword, with which dragoons are armed. The back is thick, that a blow may carry the more force, and also to render the weapon useful in the rough thrust of a cavalry charge. A sabre is occasionally curved at the point, in the form of a scimitar.

SABRE-TA'CHE (Ger. *Säbeltasche*, sword-pocket), a useless square accoutrement which dangles against the legs of officers in some cavalry regiments. It purports to be a pocket for the conveyance of dispatches, &c., but probably is never used. The sabre-tache is hung by smaller ornamental belts from the sword-belt, and is itself covered with gold brocade, the emblems of the regiment, and other devices.

SABRINA LAND, discovered in the Antarctic Ocean, March 20, 1839, by Balleny, in lat. 69° 58′ S., long. 121° 8′. See ANTARCTIC OCEAN.

SA'CCHARIC ACID ($2HO,C_{12}H_8O_{14}$) is a product of the action of nitric acid, under certain conditions, on grape and cane sugar, or on starch, gum, and lignine. It occurs as a colorless, inodorous, deliquescent, gummy, uncrystallizable mass, which is freely soluble in alcohol. It is sufficiently powerful to dissolve iron and zinc, with extrication of hydrogen. It has a tendency to form double salts, so that it is probably a bibasic acid.

SACCHARO'METER, an instrument for determining the quantity of sugar in liquids, especially brewers' and distillers' worts. In principle, it resembles the hydrometer, used for ascertaining the strength of alcoholic liquids. It consists of a hollow sphere or oval of thin brass, with a graduated stem and a hook so placed opposite each other, that when placed in water, it floats, and the graduated stem stands upright on the top, and the hook is below, for the purpose of appending weights. The degree to which the stem sinks gives the means of calculating, by tables prepared on purpose, the proportion of saccharine matter present in the liquid.

SA'CCHARUM. See SUGAR-CANE.

SACCOTOO. See SOKOTO.

SACHEVEREL, HENRY, D.D., was born in the year 1672, at Marlborough, where his father was minister of St. Peter's Church, and noted for his attachment to the High Church principles, which were afterwards embraced by his son. The youth was educated at the grammar-school of his native place, and at Magdalen College, Oxford, where he occupied chambers along with the celebrated Addison, who then and for many years afterwards seems to have entertained for him a warm regard. He obtained a fellowship in his college, and took successively the degrees of M.A. (1696), of B.D. (1707), and of D.D. (1708). In 1705, he became preacher of St. Saviour's, Southwark; and in 1709, he delivered the two sermons—one at the assizes at Derby, the other on the 5th November at St. Paul's—which have given him a place in the history of his country. The rancor with which he attacked in these sermons the principles of the Revolution Settlement, asserted the doctrine of non-resistance, and decried the Act of Toleration, excited the indignation of the Whig government of the hour, and led to his impeachment for high crimes and misdemeanors. His trial before the House of Lords took place in the spring of 1710, and resulted in his being found guilty, and suspended from preaching for three years, the obnoxious discourses being ordered to be publicly burned by the hangman. Of the rage of factions on the occasion, the fury of the popular excitement, and the excesses of the High Church party, an account in detail will be found in any history of the period. S. became for the time the most popular man in the kingdom, and the general election which followed was fatal to the government which had prosecuted him. When, in 1713, his suspension as by sentence expired, as a special mark of honor he was appointed by the new House of Commons to preach before them the sermon on the anniversary of the Restoration, and specially thanked on the occasion. A more substantial token of favor was his presentation to the rectory of St. Andrew's, Holborn.

Subsequently—except that there is some reason to believe he was more or less concerned in a plot to restore the Stuarts—he disappears from the sphere of history. He is said, in his later years, to have sought the excitement which may in some sort have become necessary to him, in a series of paltry and undignified squabbles with his parishioners. Nor in this is there anything improbable. His character was essentially a weak, vain, and shallow one, and he remains notable merely as one of those men, intrinsically insignificant, who have had a spurious notoriety and importance thrust upon them by the accident of foolish activity in a special concurrence of circumstances. See Burton's *Reign of Queen Anne* (1880).

SACHS, HANS, the most prolific and at the same time the most important German poet of his time, was born on the 5th of November 1494, at Nürnberg, where his father was a tailor. While at school, he learned the rudiments of Latin, but at no time of his life could he be called a scholar in the strict sense of the term, although he was certainly a well and widely-informed man. About the age of 15, he was sent to learn the craft of shoemaking; his love of verse, however, also led him to become a disciple of Leonhard Nunnenbeck, weaver and *meistersinger* in his native town. On finishing his apprenticeship, S., as was the custom of craftsmen in those days, made a sort of tour or pilgrimage through Germany, frequenting assiduously the verse-making schools or corporations organized by the trade-guilds in the different cities, the members of which, known as *meistersingers*, had, since the disappearance of the older *minnesingers*, or minstrels of chivalry, become the chief representatives of German poetry.

On his return to Nürnberg, he commenced business as a shoemaker, prospered in his calling; and after a long, cheerful, and happy life, died on the 25th of January 1576, at the age of 82. S. was twice married—first to Kunegunda Kreutzer, who bore him five sons and two daughters; and afterwards, in his 66th year, to Barbara Harscher. His grave is still to be seen in St. John's churchyard, Nürnberg. S.'s career as an author is divided into two periods. In the first, he shows an interest mainly in the occurrences that were then agitating Germany. It was the epoch of the Reformation of Luther, whose praises he celebrated (1523) in an allegorical tale entitled *Die Wittenbergisch Nachtigal*, while his poetical fly-sheets (of which about 200 are known) furthered in no small measure the Protestant cause. In the second period, his poetical activity was turned more to the delineation of common life and manners. His poetry is distinguished by its heartiness, good sense, homely genuine morality, and freshness; its clear and healthy humor, and its skilful manipulation of material. It is, on the other hand, deficient in high imagination and brilliant fancy, and contains large tracts of dry, prosaic, insipid verse. S.'s best productions are his *Schwänke*, or Merry Tales, the humor of which is sometimes unsurpassable; but his serious tales, allegorical and spiritual songs, and his dramas, also show a great advance on his predecessors. His special *meistergesänge*, on the other hand, are of little or no value. Manuscript copies of S.'s poems —some in his own handwriting—are to be seen in the libraries at Zwickau, Dresden, Leipzig, and elsewhere.

When S. had reached the 52d year of his career as a poet, he took stock of his work, and found that he had written 34 vols., containing upwards of 6200 pieces, among which were 4275 meistergesänge, 208 comedies and tragedies, about 1700 merry tales, secular and religious dialogues, proverbs, and fables, 7 prose dialogues, and 73 songs, secular and devotional. The first edition of his works was published at Augsburg in 1558, but the best is that of Willer (5 folio vols. 1570—1579); a later quarto edition, known as the *Kemptener*, appeared in 1612—1617, and was republished at Augsburg in 1712. After the middle of the 17th c., when a deep stupor seized the German mind, and it could produce nothing but endless tomes of theology, varied by an oc-

casional hymn of more or less merit, S., with all his poetic brethren, suffered a total neglect, from which he did not recover till Goethe wrote his pleasant poem, *Hans Sachs, Erklärung eines alten Holzschnitts vorstellend Hans Sachs's poetische Sendung* (1776), since which time partial collections of S.'s works have frequently appeared.

SACK, a large bag made of a coarse hempen cloth called sacking or sackcloth. Such bags are used for the conveyance of corn, flour, and other bulky articles. A corn-sack is usually made to contain four bushels, hence it is constantly spoken of as a measure of quantity, two sacks being equal to one quarter of corn.

SACK. A name in common use in the time of Shakspeare, and occurring down to the middle of the 18th c. as denoting a kind of wine. The exact nature of this famous wine, the favorite beverage of Falstaff, and the origin of the name, have been much discussed. Sack or seck seems to be simply an English disguise of the Spanish *seco* (Fr. *sec*), applied to wines of the sherry genus, as distinguished from the sweet wines; a term which we now translate by 'dry.'

SA'CKBUT (Fr. *saquebute*), the name under which the Trombone (q. v.) was known on its first introduction to England.

SA'CKETTS HARBOR, a village and port in New York, U. S., on the south shore of Black River Bay, 8 miles east of Lake Ontario, 170 miles west-north-west of Albany, having a navy-yard, barracks, mills, &c. In the war of 1812, it was an important port, where the frigate *Superior*, of 66 guns, was built in 80 days, and the *Madison* in 45 days, from timber standing in the forest. A man-of-war of 3200 tons, begun before the treaty of disarmament, is still upon the stocks. The town has declined since the war, and has now a population of but (1875) 734.

SACKVILLE, THOMAS, Earl of Dorset, an English poet and statesman, was born at Buckhurst, Sussex, in 1536. He was the only son of Sir Richard Sackville; studied at Oxford and Cambridge, where he acquired a high reputation as a poet both in Latin and English, and afterwards became a student of the Inner Temple. While a member of this society, he wrote, along with Thomas Norton, a blank-verse tragedy called *Ferrex and Porrex* (afterwards called *Gorboduc*), which was performed before Queen Elizabeth at Whitehall in 1561—1562. This work, the plot of which is founded on a British legend, claims particular notice as the earliest tragedy in the English language. It is moulded to some extent on the classic drama, the incidents being moralized at intervals by a chorus. It has no dramatic life or energy, but the style is pure and stately, evincing eloquence and power of thought. S.'s other productions (first published in 1563) are the *Induction*, a poetical preface to the *Mirrour for Magistrates*, and the *Complaint of the Duke of Buckingham*, which was designed to conclude the work. The *Induction* is a noble poem, uniting, as Hallam says, 'the school of Chaucer and Lydgate to the *Fairy Queen*,' and almost rivalling the latter in the magnificence and dignity of its allegoric personifications. The influence of Dante is very perceptible. S. now abandoned literature, and after traveling in France and Italy, returned to England, and entered public life. Soon after his father's death in 1566, he was created Lord Buckhurst, became a favorite with the queen, who employed him in foreign diplomacy, and on the death of Burleigh, succeeded him in his office of Lord High Treasurer (equivalent to Prime Minister in those days), in which capacity he showed himself not inferior in sagacity and fidelity to his great predecessor. On the accession of King James, his patent of office was renewed for life; and in the following year, he was created Earl of Dorset. S. died April 19, 1608, and was buried with ceremony in Westminster Abbey. His works are edited by the Rev. Sackville West, in Smith's *Library of Old Authors* (Lond. 1859).

SA'CO, a river of New England, U. S., rises in the White Mountains of New Hampshire, runs south-easterly through the south-western portion of Maine, through Saco Bay, to the Atlantic Ocean. Its course of 160 miles is almost a continuous succession of falls, the last being but 4 miles from its mouth, affording water-power to numerous factories.

SACO, a town in Main, U. S.. is built on the east bank of the Saco River, at its last falls, 4 miles from its mouth, 14 miles south-west of Portland. It has numerous manufactories, including 5 cotton-mills, which produce 7.000 000 yards annually, 4 saw-mills, and several ship-yards. Pop. (1870) 5755.

SA'CRAMENT (Lat. *sacramentum*, *mysterium*, Gr. *mysterion*), the name given by theological writers to certain religious rites, the number as well as effects of which are the subject of much controversy between various bodies of Christians. The word *sacramentum*, in primitive classical usage, meant either the oath taken by soldiers on their first enrolment, or the sum of money deposited by suitors on entering upon a cause, and forfeited 'to sacred uses' by the unsuccessful party; and the corresponding classical Greek word *mysterion* meant not merely the secret religious ceremonies practised in the worship of certain gods, but also any revealed secret. It is certain, nevertheless, that at a very early period of the Christian Church, both the Latin word and its Greek equivalent came to be applied specially to certain rites of the Christian ceremonial, and chiefly (or as is commonly held by Protestants, exclusively) to those of baptism and the Eucharist. Of the catechetical lectures of St. Cyril of Jerusalem, the lectures devoted to the subject of baptism and the Eucharist are called 'mystagogic lectures.' For our purposes, it will be enough to state concisely what are the views of the several religious communities on this much controverted subject, which formed one of the earliest grounds of division between the Roman Church and the Reformers of the 16th century.

In the Roman Church, it is held that there are seven sacraments, viz.: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The special teaching of Catholics on each of these rites will be found under the several heads; but there are certain general principles regarding them all, on which the Roman Catholic doctrine differs widely from that of the Reformed communities. Catholics define a sacrament to be a visible or sensible sign permanently instituted by God, and conveying real interior grace to the recipient, and they teach that all sacraments contain within themselves, as instruments, and, when they are received with proper dispositions, produce such grace by the virtue imparted to them by God, and not merely through the faith of the recipient; although they hold that proper dispositions on the part of the recipient, as sorrow for sin, love of God, pious resolves, &c., are conditions indispensable for the efficacy of the sacramental rite. See OPUS OPERATUM. They divide the sacraments into two classes, 'sacraments of the living,' and 'sacraments of the dead.' The first class comprises the Eucharist, Confirmation, Holy Orders, and Matrimony—all which sacraments can only be received fruitfully by persons in a state of grace or justification. The second includes Baptism, Penance, and Extreme Unction, the special purpose of which is to remit sin, and which therefore can be received by persons in a state of sin, but penitent for that sin, and resolved to amend their lives. Of three of the sacraments, viz., Baptism, Confirmation, and Holy Orders, it is held that they imprint a 'character,' and therefore that they can only be received once. The others may be repeatedly received, but under conditions which will be learned under each separate head. Two things are held to enter into the constitution of the sacrament—viz., the 'matter' and the 'form.'

By the former is meant the material element or the physical action whereby that element is applied to the recipient of the sacrament; as water in baptism, oil in extreme unction, and in both the act of washing or of anointing. By the latter is understood the form of words employed by the minister in communicating to the recipient the external rite in which the sacramental act consists. The minister of a sacrament is the person who is supposed to be divinely authorized to impart it. The minister is different for different sacraments, as will be found under each separate head.

The Reformed Churches have for the most part discarded these views. By the majority of them, the sacraments are held to be merely ceremonial observances, partly designed as a solemn act, by which each individual is admitted to membership, or desires to make solemn profession thereof; partly intended to stimulate the faith and excite the fervor and the pious dispositions of the recipient, to which dispositions alone all the interior effects are to be ascribed. As to the number of rites called by the name, almost all Protestants agree in restricting it to two—viz., Baptism and the Lord's Supper; although some of the rites which Catholics regard as sacramental are retained by some of the Protestant communities as religious observances. In the English Church, however, there has always been a school in which opinion tending towards the Catholic view has prevailed. Not only has this school ascribed to the two rites of Baptism and the Eucharist or Lord's Supper (q. v.) the power of producing an interior grace (which in the former is called regeneration); but many of them have been willing to call the other rites, especially confirmation, penance, and holy orders, by the name of sacrament, although of a secondary character, and not 'generally necessary to salvation.' See TRACTARIANISM. The controversy on these questions has been in recent times the subject of more than one proceeding in the ecclesiastical courts and in the Privy Council.

SACRAMENTA'RIAN, the name given in the 16th c. to the party among the Reformers who separated from Luther on the doctrine of the Eucharist. Luther (q. v.) taught the doctrine of the real presence of the body and blood of Christ along with the bread and wine (see LORD'S SUPPER; REAL PRESENCE). The first of his followers who called this doctrine in question was Andrew Carlstadt; and notwithstanding the protest of his leader, Carlstadt had many followers, the most active of whom were Capito and Bucer. The party became so considerable, that in the diet of Augsburg they claimed to present a special confession distinct from that put forward by the general body. The sacra-

mentarian confession is known in history by the name of the Tetrapolitan Confession—so called from the four cities, Strasburg, Constance, Lindau, and Memmingen. The Tetrapolitan Confession rejects the doctrine of a corporeal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence of Christ's body. Simultaneously with this German movement, yet independent of it, was that of the Swiss reformer Zwingli, whose doctrine on the Eucharist was identical with that of Carlstadt, and who himself presented a private confession of faith to the Augsburg diet, in which this doctrine is embodied. The four cities named above continued for many years to adhere to this confession presented to the diet of Augsburg in their name; but eventually they accepted the so-called Confession of Augsburg, and were merged in the general body of Lutherans. On the contrary, the article of Zwingli upon the Eucharist was in substance embodied in the confession of the Helvetic Church.

SACRAME'NTO, a city and port of entry and capital of California, is built on the east bank of the Sacramento River, 125 miles from the sea, lat. 38° 33′ N., long. 121° 20′ W. The streets cross each other at right angles on a level plain, only 30 feet above the sea. The stores and shops are built of brick, the dwellings of wood, with shade-trees and gardens. The principal public buildings are the state capitol, custom-house, and post-office. The chief trade is furnishing supplies to the mining districts, with which it has daily communication by steamers and stages. S. was settled in 1839 by Captain Sutter, a Swiss, who built a fort. In 1848, the first town-lots were sold, and the first house built in 1849. In 1853, the town was inundated to the depth of 5 feet in the streets, which have been raised and protected by embankments. In 1854 it became the state capital. Pop. (1870) 16,283; (1880) 21,420.

SACRAMENTO, a large river in California, U. S., which, with the San Joaquim, drains the Great Central Valley. It rises in the north-eastern part of the state in the Sierra Nevada, by North and South Forks, where, during its south-westerly course of 200 miles, it is called Pitt River and Upper Sacramento; thence it flows nearly due south, receiving numerous branches from the Sierra Nevada on the east, and the coast-range of mountains on the west, until it unites with the river San Joaquim, and flows westerly through San Pablo and San Francisco bays to the Pacific Ocean. It is navigable to Sacramento, 50 miles from San Pablo Bay, and for small vessels 150 miles further, its entire length being about 500 miles.

SACRA'RIUM, a sacred apartment in Roman houses.

SACRED HEART OF JESUS, FEAST OF, a modern festival of the Roman Catholic Church. Its origin is traced to a vision which is recorded of a French nun, of the order of the Visitation, named Mary Margaret Alacoque, who lived at Paray la Moniale, in Burgundy, in the latter half of the 17th century. This devotion was gradually propagated in France, and at length was approved by Pope Clement XII. in 1732 and 1736, and by Clement XIII. in 1765. The festival is held on the Friday after the octave of Corpus Christi. During recent years a fresh impulse has been given to the devotion, and in 1873 numerous bodies of pilgrims resorted to Paray la Moniale; and several dioceses and countries were dedicated to the Sacred Heart by special and solemn ceremonial. The confraternities of the Sacred Heart are very numerous

SACRED MUSIC. Music has, from very early times, been connected with religious rites. It entered into the worship of the Jews, and both sacred and profane history tell us that, in the primitive Christian Church, the service consisted partly of music. Little is known regarding the kind of music used by the early Christian converts; it has been supposed to have been partly Greek, with an intermixture of Hebrew melody. As early as the time of Ignatius, who was a disciple of St. John, the Psalms of David were sung *antiphonally*, as practised to the present day—i. e., by two choirs responding to each other, which had doubtless been formerly the practice among the Jews. At first the whole congregation, clergy and laity, joined in the psalm; but difficulties and abuses having arisen from the growing neglect of musical culture, the Council of Laodicea, in 363, found it necessary, for the securing of decency and order in worship, to prohibit the laity from singing in church except in certain chants of a very simple and popular character. From that period down to the Reformation, the music of the church was almost entirely surrendered to the clergy and trained musicians. See PSALMODY.

The first name of importance in the history of the music of the Western Church is St. Ambrose (q. v.), whose musical service (see AMBROSIAN CHANT) was reformed by Pope Gregory (see GREGORIAN CHANT). The use of the organ in churches dates from about the 9th c., and some centuries later. Counterpoint (q. v.) was introduced to a limited extent into the music of the church. Among the corruptions which followed it, some are of a nature the very mention of which startles us. Not merely were popular melodies of a secular nature often taken and worked up into church music, but the secular words were actually transplanted into the religious compositions, being habitually given out by the tenor voice, while the actual solemn words of the church service were being sung by soprano, alto, and bass. Papal bulls having sought in vain to combat this abuse, it was brought under the cognizance first of the Council of Basel, and then of that of Trent. The Council of Trent prohibited the performance of any mass or motett of which profane words formed a part, and also of music founded on secular themes. Some compositions of Palestrina were singled out for praise, and their author was intrusted with the task of remodelling this part of religious worship. He composed three masses on the reformed principle, one of which, known as the *Missa papæ Marcelli* (so called as being a tribute of gratitude to the memory of that pontiff) may be looked on as having saved music to the church, by establishing a type far higher than anything that had preceded it, and still revered by all lovers of music. The *mass* (including the *offertory* and *gradual*) has always continued to be an important part of the sacred vocal music of the Roman Catholic Church, and affords large scope for the display of the higher qualities of musical composition.

Various new types of music sprang up in the different Protestant churches after the Reformation. The solemn and measured *chorale* (q. v.), or melody to which psalms or hymns are sung in unison, though generally associated with the Lutheran Church of Germany, was in reality handed down from a very early period. Psalmody in its modern sense may be considered to have originated in the 16th c., when Clement Marot, the court poet of Francis I., translated fifty-two of the Psalms into French verse. Psalm-singing was at first a fashionable amusement of the gay courtiers of Francis; but being taken up by the Reformers, was soon discountenanced by the Roman Catholics, and looked on as a badge of Protestantism. See PSALMODY.

In the full choral service of the Church of England, as performed in cathedrals and collegiate churches, the greater part of the prayers and the litany are *intoned* or read in monotone (see INTONING), the monotone being occasionally varied by harmony at the close. The Psalms and *Gloria Patri* are chanted with the accompaniment of the organ, as also are the various canticles; the latter, however, particularly the *Te Deum*, being often sung to rhythmical music of a more elaborate kind, called *services*. The form of the Anglican chant now used for the Psalms seems to have been invented by Tallis. In the single chant, each verse is sung to the same music; in the double chant, the whole occupies two verses. The antiphonal chanting, with the Anglican double chant, has sometimes been objected to as repugnant to the proper expression of the words, as coupling verses between which there is a full stop in the sense, and as placing a full stop when the sense runs on; and among the High Church party there has been a disposition to recur to the Gregorian chants, whose indefinite musical expression, absence of rhythm, and uncertain accent, give them a power of bending to the requirements of the words.

The Gregorian chant has, however, not succeeded in making its way into the service of any of the English cathedrals. The *anthem* forms a part of the complete musical service. It is somewhat similar in character to the motett of the Roman Catholic and Lutheran churches; a sacred cantata, in which the words are taken from the Psalms or other portions of Scripture; and the music is for solo, parts, or chorus, or a mixture of the three.

In the Presbyterian churches of Scotland, psalmody, until recently, formed almost the entire music; but hymns also are now in general use. Hymns predominate among the English dissenters. Some years ago, church music in Scotland had fallen to the lowest state of degradation; but efforts have lately been made, with some success, to raise its character. Even organs, which were proscribed by the early Scottish reformers, and have ever since been in disfavor, have begun to be introduced; and chanting has been admitted into some Presbyterian churches.

Of sacred musical compositions not intended to form part of the service of the church, the most important is the *Oratorio* (q. v.), a composition either entirely dramatic, or combining the drama and epic, where the text is illustrative of some religious subject, and the music consists of recitatives, airs, part-songs, and choruses, accompanied by orchestra and organ.

SA'CRIFICE, one of most important elements of divine worship, common to all nations of antiquity, and therefore traced by some to a primeval revelation. The powers of nature, palpable in their effects for good and evil, could not but inspire man, even in his rudest stage, with gratitude or fear towards the unseen being or beings by whom he conceived them to be actuated. The next and most natural step was the outward manifestation of these feelings by a token which bespoke either thankfulness or the wish of conciliation on the part of the donor. The supreme numina being conceived merely as superior men with exaggerated

human wants, the means taken to gratify them were adapted to this conception. The best and first fruits of the soil, the finest and most immaculate animals of the flock, were offered to the gods, that they might either partake of them bodily, or at least enjoy the sweet smell arising from the altar on which they were burned in their honor; and the deity was supposed emphatically to express its readiness to accept the offering by sending down the fire that was to consume the animal prepared. The more the divine favor was sought for some special purpose, the costlier and more precious became the gift; and nothing short of the most startling proofs of self-abnegation seemed, at times, to satisfy the devotion of man in his uncultivated state. From the simple and child-like notion of establishing a certain kindly and permanent relation between the invisible powers and man, by the yielding up on the part of the latter a certain more or less precious portion of what the former had given him, there grew up such horrible monstrosities, that, in honor of humanity, we should feel inclined to doubt them, were they not so well attested, and did they not, to a certain extent, still prevail in our own days.

Method and system took in hand that undeveloped child-like instinct which touchingly offered the deity a flower, a blooming bough, a golden fruit; and degraded it into mysticism and superstition; ending at last in the theory that the divine revenge was to be gratified, the divine vanity flattered, and the deity made as generally pleased as could be by holocausts of human beings, friends or foes—nay, the dearer the being to the offerer, the more the self-abnegation must become patent, and the more the god must smile upon the donor. The Moloch worship—the mother placing her babe in the arms of the monstrous idol, and seeing it slowly burned before her own eyes—seems well nigh to exhaust all the horrors of human ingenuity.

Turning first of all to those most ancient and hallowed records of humanity contained in the Old Testament, we find the custom of sacrifice almost on its first pages, and spoken of as a rite already established. Sacrifice is the cause of the first murder on record. Abraham is prevented by a voice from heaven from carrying out the slaughter of Isaac, into which he had been 'tempted' by Jehovah; all the patriarchs, in fact, sacrifice, either independently or in ratification of a covenant; and the exodus itself was brought to pass under the pretence of the people having to offer up their wonted sacrifice in the desert.

According to the highest ancient authorities, both Jewish and Christian—of whom we will only mention Maimonides and Ephraem Syrus—the Mosaic sacrifices were neither more nor less than a kind of divine concession to the sensual nature of an uncultivated people, full of Egyptian reminiscences on the one hand, and surrounded by Canaanitish modes of worship on the other. It was, as Ephraem Syrus says, only at a very late period that Moses, by the command of God, in whose eyes the rites of priests and sacrifices have but little value, prescribed these observances to his people, on account of their weakness and hardness of heart—lest they might despise a 'naked' religion, and attach themselves to false gods, whose magnificent and dazzling cultus surrounded them on all sides. In corroboration of this view, the prophets are appealed to, who never cease to inveigh against sacrifice as such, when, according to their view, the people were educated enough to do without this symbol and to worship God in truth and in spirit. (Compare Jeremiah vii. 22; I Samuel xv. 22; Psalms l, 8—10; li. 18, 19; Isaiah i. 11, &c.) But the institution being deemed necessary for the time, legislation had to circumscribe it rigorously, so as to make it as little hurtful as possible. Ceremonies contrary to morals and decency, such as were practised in the temples of Canaan, the abominations of phallic rites, the sacrifices of virginity, and finally, the offering up of human beings, were punished with instant death by the Mosaic law.

How the principal modes of sacrificial offerings, such as they had naturally developed, nearly alike everywhere throughout antiquity, and as they had obtained in the pre-Mosaic times among the Hebrews, were adopted in the Mosaic legislation, and adapted to its exalted religious character, we can only indicate here in the briefest outlines. These pre-Mosaic sacrifices were chiefly of three kinds: first, the 'propitiatory,' i. e., an offering enjoyed by the deity in any form that would be grateful to him, conciliate him, procure his aid and blessing in times of need or for some special undertaking, and would further obtain his forgiveness, if something had been done unwittingly that might have offended him. This kind of sacrifice, whether bloody or unbloody (e. g., harvest sacrifice), appears to have been fully burned (*Olah*). The second kind partook more of the nature of sacrificial meals, in which both the divinity, the priest, the man who offered the sacrifice, together with his friends, took a part. It was a solemn and joyous oblation, expressing the thanks of the individual for some obtained favor, in which he wished others to join. Only the parts supposed to be the choicest were burned upon the altar; the priests received some other parts, and the rest formed the grateful sacrificial repast (*Sebach Shelamim*). The last was the expiatory sacrifice, intended as an equivalent for some deadly crime, which either was not punishable by the existing laws, or which had been committed under circumstances that would not have warranted capital punishment. From the notion, that the blood of the murderer was necessary for 'the cleansing of the blood that is shed' (cf. Numb. xxxv. 33), sprang that other, it would appear, that there was expiatory power in the blood itself; and that further, the blood of an animal was a fitting representative of, and equivalent for that of the human criminal, who had only to transfer, as it were, his sin to the animal by placing his hand upon its head, and perhaps using a formula to that effect.

The flesh of this animal was not deemed fit for the altar, and was probably burned at some other place (*Chattah Asham*). The Mosaic legislation finding such general elements ready, proceeded eclectically. They were partly embodied with considerable alterations, and partly rejected unconditionally. The anthropopathic idea of the 'agreeable smell,' as well as the notion of the expiatory power of the blood, were retained—the latter, however, with this modification, that the poor were allowed to use flour instead of meat for their sin-offerings. But the principal alterations introduced were the abolition of all polytheistic rites from the sacrificial service, of all the immoral, obscene, and horrible ceremonies connected with the heathen practice, and finally, the totally different definition and limits given to the 'sin-offering.' While formerly, everything could be expiated by a sacrifice, henceforth, only unpremeditated sin could by this means be effaced; while there was no expiation for any premeditated crime; the law simply took its course in that case.* Further, many things till then permitted were prohibited, and thus fell under the denomination of 'sin;' and certain purifications—beneficial in themselves—were connected with the expiatory sacrifice, and their practice thus strongly enforced. This extension of the notion of 'sin-offering' rendered a subdivision of it necessary; the more venial, or rather unconscious transgressions, were treated differently from the less pardonable ones in the ritual.

While Mosaism thus seemed, in its adoption of the rite of sacrifice, to make one of the most important concessions to heathenism, this very rite was, on the other hand, calculated to attract the early Hebrews to the worship of Jehovah, and at the same time to wean them from the horrible practices connected with it among the Canaanites. But more; during the primary stages of the people's existence, it served, by inculcating observances which were at once hygienic and symbolic of purity and holiness, as a powerful means of education and culture. In order, however, that these beneficial consequences premeditated by the lawgiver should not be frustrated, it was necessary, above all things, to keep the strictest possible supervision over it; and this was best established by the legal transfer of the whole sacrificial service to one single spot of the land, finally, the temple at Jerusalem. The 'heights' and their 'heathen abominations' were thus theoretically abolished, and the sacrifice that only at one central point could in reality be said to be offered up for the 'whole community of Israel,' went far, under these circumstances, to awaken and to strengthen a common spirit of nationality and patriotism, which was further aided by the periodical pilgrimages. For the details of the Jewish sacrifices, we must refer to the Old Testament generally.

As to the different opinions held by Jewish and Christian authorities regarding sacrifice, when offered up in expiation of a sin either by the people or by individuals, suffice it here to mention that they are divided between the various notions of the offering being either a present to the offended deity, a civil punishment (*mulcta*), or, finally, a kind of substitute for the sinners themselves. The latter is the view held by many of the rabbinical writers as well as church Fathers. The life (Nephesh) of the animal or its blood (Lev. xvii. 11) was distinctly said to make 'the atonement for the soul.' This notion of a representative victim is one that belonged to the whole ancient world, and often finds its expression in the Old Testament. The sacrifice of the covenant (Jer. xxxiv. 18, &c.), the scapegoat (Lev. xvi. 21), and the like, are so many embodiments of this idea; which by Christian divines is held to have found its acme and final fulfilment in the sacrifice of God himself, as the 'Man Christ,' who united in himself the priest, the offerer, and the sacrifice. In fact, the whole institution of sacrifices is throughout the New Testament and the Fathers held to have been merely typical of this final act, by which the sin of man was expiated. See ATONEMENT, MASS.

The Jewish sacrifices, rejected already by the Essenes, ceased with the downfall of the Temple in Jerusalem; although the Samaritans, who claim to retain exclusively the Mosaic covenant, still continue this rite on Mount Gerizim on the Passover. The orthodox Jews, however, include in the prayers for the restora-

* One of the most characteristic exceptions, however, was that in favor of those who had denied the possession of some pledged article, or who had wilfully cheated or robbed their neighbors. If they were eager to make voluntary and ample restitution, 'the door of repentance was open to them,' and they were allowed to make public expiation through sacrifice.

tion of the visible sanctuary on Zion, also that of the restoration of the sacrifices 'in their order and proper rule,' 'of the priests to their service, and the Levites to their songs and hymns,' and each day, Sabbath, or Feast, the sacrifice incumbent upon it is mentioned in the prayers; and on fast-days, especially on the day of atonement, the diminution of bodily substance supposed to arise from the abstinence, the 'fat and blood' may, it is supplicated, be considered by God as tantamount for that of the sacrificial animals which, through their sins, the people are not now deemed worthy of offering up. The modern (extreme) party of reformed Jews, however, repudiate, together with the literal interpretation of the Messianic prophecies, also that notion of the sacrifices ever being restored again.

We can only very briefly touch upon the sacrificial customs among other nations of antiquity. The same feeling of dependence upon supreme, invisible, but ever-present powers, engendered, as we said at the beginning, everywhere nearly the same expressions of awe, gratitude, and the like. The gifts proffered differed, according to the degree of culture, the mode of life, and the products of the soil among the different peoples. No less was the significance attached to the gift different in proportion to the mental development of those who offered; at one time considered as at present, to be taken and sensually enjoyed, as it were, by the Deity, it at others assumed a higher and purely symbolical aspect, as an expression of gratitude, love, repentance.

In the same proportion, the gifts themselves varied, not only respecting their nature, but also respecting their value. While Mongols and Tartars, Lapps and Negroes, most of the ancient nomad tribes in fact, generally sacrificed the milk and the uneatable parts of the animal only, its bones, horns, skin, &c.; the Greeks and Romans offered not unfrequently thousands of the choicest, most immaculate animals, and the sacrificial vessels were with them, as with the Hebrews, wrought of the most precious metals. Votive offerings—arms, spoil, garments, tools, locks, poems, &c.—customary in the better days of Rome and Greece; and the sacrifice of chastity on the part of maidens and women —chiefly the custom of Babylon, Phœnicia, Cyprus, &c., likewise fall under the denomination of sacrifice in its wider sense. Among the Indians, Bactrians, Medes, and Persians, the sacrifices consisted of fruits, libations, animals, and the like, and were of many degrees and numbers. Among the first-named, the study of the Vedas was reckoned as the first round in the sacrificial ladder. With the Persians (see GUEBRES, PARSEES), the priests at the Daruns sacrifice, instituted in honor of Zerdusht the lawgiver, eat small unleavened cakes, and drink Hom-juice, which is to represent the blood of the prophet. They also have sacrifices for the souls of the deceased. The Buddhists offer flowers and first-fruits only; their animal sacrifices are represented by small animal figures kneaded of dough, offered up on certain occasions. Of the 'classical' peoples and their sacrificial debauches, which followed the primeval frugality in their offerings no less than in their lives, we need not speak here, save as far as they, too, indulged in the rite of human sacrifice from their very earliest period to their decadence.

Among the Greeks, the legendary tales of the daughters of Erechtheus, and of Iphigeneia in mythical times, the sanctuary of Zeus Laphystius at Halos and at Lycæa, in Arcadia, the offering up of three Persians by Themistocles before the battle of Salamis, are tokens sufficiently indicative of the generaltity of the practice. Among the Romans, human sacrifices, in use during the Republic—either enthusiastic voluntary deeds of patriotism, or simply a kind of execution in punishment of a deadly sin—were prohibited in later times by the senate; but both Augustus and Sextus Pompeius committed wholesale murders by way of political sacrifice to the gods. That this abomination of slaughtering men in honor of God at stated periods, flourished to an awful extent among our northern ancestors—Scandinavians and Germans, as well as among Gauls and other Celts—need hardly be added. At Upsala, every ninth year, a great sacrifice of expiation was offered up, consisting of nine human beings and sixty-three animals. The Danes, in the same manner, held a sacred sacrifice every ninth year, of ninety-nine men, besides horses, dogs, cocks, and other domestic animals (see the EDDAS; Muller, *Sagenbibliothek;* Pertz, *Mon. Germ. Hist.; Script. passim*, &c.). The German tribes, even after their conversion to Christianity, continued to offer up their prisoners of war, as of yore, just as the Franks brought their sacrifices both to their ancient gods and to Christ. Any illness, danger, sickness—the slightest inducement, in fact, sufficed to move the Gauls towards a human holocaust, in the fashion of the worshipers of Baal and Moloch. At the death of a man, all his possessions, movable and immovable, including slaves, clients, wives, and all, were offered up to his manes. See SUTTLE. That the ancient Mexicans, the negroes, and other wild tribes, were highly proficient in this sort of wholesale slaughter, need hardly be added: the king of Dahomey's practices, and the fruitless remonstrances of our own government, are a too well-known illustration of the firm hold this kind of murder in honor of the Deity has of the human mind. In conclusion, may we not consider the cruelties and massacres committed upon the Jews in the middle ages, in the name of Christ, as a last offspring of that Moloch or Baal worship which seems to be an instinct in the superstitious mind, whether Pagan or Christian?

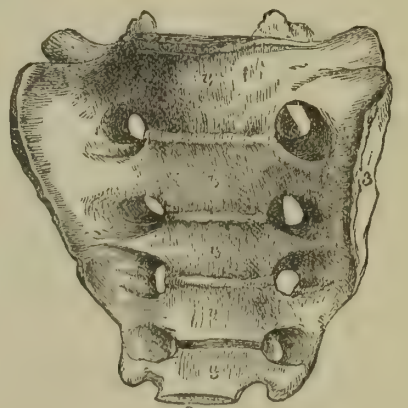
SA'CRILEGE is not now a legal, but is a popular term used to denote the breaking into a place of worship, and stealing therefrom. In England, whoever breaks and enters any church, chapel, meeting-house, or other place of divine worship, and commits any felony therein; or whoever, being in such places, shall commit any felony therein, and break out of the same, is guilty of felony, and liable to penal servitude for life, or for not less than three years, or to imprisonment for a term not exceeding two years, with hard labor. The legal offence comes generally under the head of burglary or house-breaking. A less punishment applies to the offence when committed in dissenting chapels.—In Scotland, there is no increase of severity in the punishment, by reason of the sacred character of the things stolen.

SA'CRISTAN (Lat. *sacra*, sacred things), an official attached to a church, who is charged, under the priest or ruler of the church, with the care of the church, and of all its appurtenances. It is his duty to open and close the church, to take care of the sacred vestments and utensils, and to prepare what may be required for public service. In some Roman Catholic churches, the sacristan is a clerk in minor orders. The English name sexton is derived from this word.

SA'CRISTY, an apartment attached to a church, in which are kept the sacred objects used in the public worship, and in which the clergy and other functionaries who take part in the service assemble and prepare for the ceremonies on which they are about to enter. In many foreign churches, the sacristy is a spacious and costly building.

SACROBOSCO, JOANNES DE (Anglicè, *John of Holywood*), was an English mathematician of the 13th c., entered the university of Paris in 1221, and afterwards became professor there. He died at Paris in 1256. S. was one of the first doctors of the middle ages who made use of the astronomical writings of the Arabians. His treatise, *De Sphæra Mundi*, is merely a paraphrase of a portion of Ptolemy's *Almagest*. No book enjoyed greater renown as a manual among the scholastics. First published in 1472, it passed through more than 20 editions—some even say 65 —with as many commentaries. Other works of S. are *De Computo Ecclesiastico* and *De Algorithmo*, one of the first works on arithmetic in which the numerical notation of the Arabs is employed.

SA'CRUM, or OS SACRUM, is a triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebræ with their bodies and processes, all consolidated into a single bone. Its anterior surface (as shown in the figure) is concave, not only from above downwards, but



Sacrum.

1, Surface articulating with last lumbar vertebræ; 2, surface articulating with coccyx; 3, surface articulating with the os innominatum; v_1, v_2, v_3, v_4, v_5, the bodies of the five sacral vertebræ.

also from side to side. The posterior surface is convex, and presents in the middle vertical line, a crest, formed by the fusion of the spines of the vertebræ, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected.

Various reasons have been assigned for the peculiar name given from very olden times to this bone. One of the reasons assigned

is, that it was the part used in sacrifices. Another reason is based on the view maintained by the Jewish rabbins, who held that this part of the skeleton, which they called 'luz,' resisted decay, and became the germ from which the body would be raised:

> 'From whence the learned sons of art
> *Os sacrum* justly call the part.'
> Butler's *Hudibras*, cant. ii. part iii.

SACY, Antoine Isaac, Baron Silvestre de, one of the most celebrated orientalists, was born at Paris in 1758. After being grounded in the classics, he commenced at the age of 12 the study of Hebrew, to which, as he advanced in years, he added the other branches of Semitic—Syriac, Aramaic, Samaritan, and finally Arabic. Persian and Turkish he acquired still later; but though one of the greatest masters of Arabic and Persian that ever lived, he never made much progress in Turkish. Modern European languages and jurisprudence formed collateral branches of his stupendous acquisitions. From 1781, he held various appointments under government, chiefly in the Mint. His first appearance in the world of letters dates from 1780, when he commenced to contribute to Eichhorn's celebrated *Repertorium*. In 1785, he was elected a member of the French Academy; and a number of monographs by him followed each other in quick succession in the Transactions of this body, chiefly on Arabic and Persian history, literature, and antiquities.

In 1793, he published his first great work, the *Annales de Mirkhond*, translated, with an extensive commentary, from the Persian. In 1792, he retired from the service of the government, to devote himself exclusively to his favorite studies; in 1795, he was appointed to a Chair in the newly-founded Ecole des Langues Orientales; but refusing to take the oath of hatred against royalty, he was not allowed to teach. In 1803, when the Institute was completely reorganized, he took his seat there again; and shortly after was nominated Professor of Persian at the Collége de France. In 1808, he became a member of the Corps Législatif, and was subsequently attached to the Commission and Council of Public Instruction. In 1822, he was made Administrator of the Collége de France and the Ecole Spéciale des Langues Orientales; and in the same year he founded, with Abel Rémusat, the Société Asiatique. Under the New Orleans Government, to which he soon attached himself, he was nominated Inspector of the Oriental Type of the Oriental Printing-Office, and Perpetual Secretary of the Académie des Inscriptions. Yet, with these numerous offices on his shoulders, to all of which he attended most conscientiously, he never for one instant relaxed in his studies; and the number of his essays, memoirs, pamphlets, papers, &c., besides his larger works, is perfectly prodigious. He died, full of years and honors, in 1838, and was buried in the Père Lachaise. The Academy had a medal struck in his honor, and his bust was placed in the library of the Institute. Oriental studies owe to him more, almost, than to any other orientalist of our age. Irrespective of his own brilliant and numerous labors, he furthered and promoted his favorite science in every possible way—founding, or causing to be founded, oriental chairs in France; and forming such disciples as Freitag, Kosegarten, Rasmussen, Chézy, Quatremère, Jaubert, Saint-Martin, and others of more or less eminence as orientalists.

Among his works we would chiefly enumerate his *Grammaire Arabe*, the most classical work of its kind, and which has given Arabic studies an entirely new impulse, forming, as it were, the turning-point between the ancient and modern oriental philology. Next to this stands his *Chrestomathie Arabe*, with the *Anthologie Grammaticale Arabe*. Among his other writings are *Mémoires sur Diverses Antiquités de la Perse;* the translation of Abdollatis's *Egypt* with notes; his editions of *Calila ve-Dimnah;* of the *Pend-nâmeh*, with a French translation; the *Makamat* of Hairiri; his *Mémoires sur l'Etat Actuel des Samaritains; Exposé de la Religion des Druses;* and his manifold contributions (above 400 in number) to the *Magasin Encyclopédique, Mémoires de l'Institut, Recueil de l'Académie des Inscriptions, Fundgruben des Orients, Annales des Voyages, Journal de la Société Asiatique, Biographie Universelle*, and Eichhorn's *Repertorium für biblische und orientalische Literatur Revue des Deux Mondes*, &c.

SACY, Samuel Ustazade Silvestre de, son of the foregoing, a journalist, was born in 1801. In 1828, he became attached to the staff of the *Journal des Débats*, and has ever since remained faithful to its columns. His has been chiefly the polemical part; and it is supposed, that, not omitting to take part in almost every public question, he wrote about two-thirds of the political articles that appeared in that paper during the second quarter of the present century. From 1852, when the Empire was re-established he relinquished politics, and became the principal reviewer of the paper. In 1848, he was appointed administrator of the Mazarin Library; in 1854 was elected a member of the Academy; in 1864 he became a member of the Council of Education; in 1867 of the Senate. In 1858, he published a collection of his literary articles (*Variétés Littéraires, Morales, et Historiques*, 2 vols.) In conjunction with Ed. Thierry and others, he edited *Rapport sur l'état des Lettres et des Sciences* (1868). He also edited a number of religious works, and in 1861—1864 an edition of the Letters of Madame de Sévigné in 11 volumes. He died Feb. 1879.

SA'DDENING, a peculiar method of applying certain mordants in dyeing and printing cloths, so as to give duller shades to the colors employed than those they ordinarily produce.

SA'DDLEBACK, a well-known mountain of Cumberland, 4¼ m. N.E. of Keswick, 2787 feet high.

SA'DDLERY. Saddlery is next in importance to human clothing, being essential to the employment of horses, therefore its manufacture is carried on in almost every town and village. England, however, exports large quantities of saddlery, nearly all of which is made at Walsall, in Staffordshire, or in the neighborhood. The value of the exports of saddlery and harness amounts to nearly £400,000 per annum. A saddle consists of the wooden frame or *saddle-tree*, the *skirts* or padded *under-flaps*, the *upper-flaps* and *seat*, which are generally made of tanned pigskin, the *girth* or *belly-band*, the *stirrup-straps*, the *stirrups*, and the *crupper-loop*.

SA'DDUCEES (*Zedukim*), a Jewish school or party—not a 'sect,' as they have been generally denominated since Josephus—of the times subsequently to the Syrian wars, and often mentioned in the New Testament, the Talmud, and the Midrash. Their origin, as well as their name, has given rise to many speculations and suggestions, but none can be considered satisfactory. Modern investigators have derived the name from Zadikk, righteous man, a denomination which the S. are supposed to have assumed in contradistinction from the Pharisees, the Separatists, as designating their own rejection of all superfluous and exaggerated religious practices, and their stand upon the words of the law itself.

The tenets of the S. are noticed as contrasted with those of the Pharisees (q. v.).

A misconceived notion of some Church Fathers, to the effect that the S. rejected all the canonical books of the Old Testament, with the sole exception of the Pentateuch, hardly requires refutation. They held the whole of the Old Testament as sacred as the Pharisees, and they quote equally from all its portions in support of their views. They would, if this or any other of those exaggerated accounts of their 'unbelief' had any foundation, not have remained in the Sanhedrim, their members would not have been high-priests, and the Pharisees would not have fought against them about mere trifles and casuistically. But, on the other hand, their sober rationalism could not, apart from their aristocratic tendencies, at a time in which the immense struggle for liberty was still fresh in the people's minds, gain for them that popular sympathy which the Pharisees—eager, jealous, patriotic, pious, learned men of the people, enthusiastic men of progress—so easily acquired and held. Thus Sadduceism, of which we hear so much in the New Testament, and which was combated as 'the leaven of Herod' by Christ, while he only inveighs, as does the Talmud, against the hypocrites among the Pharisees, died out soon after the 1st c. A.D. The term under which they are once mentioned in the Mishna, viz., Karaim, became, at a later period, the name of a Jewish sect, still in existence, who reject all tradition, simply holding by the Written Law as their sole guide. See article Jewish Sects. The Talmud speaks of certain writings of the S., but nothing has survived. A criminal code of theirs, of a somewhat arbitrary nature, is mentioned in *Mes. Taan* iv.

SADI, Sheikh Muslih Addin, one of the most celebrated Persian poets, was born at Shiraz, about the year 1184. Little is known of the circumstances of his life. His father's name was Abdallah, and he was a descendant of Ali, Mohammed's son-in-law; notwithstanding his noble lineage, however, he held but an insignificant position. S. was early left fatherless. He received his education in science and theology at Bagdad, and from here he undertook, together with his master, his first pilgrimage to Mecca; a pilgrimage which he subsequently repeated no less than 14 times. He traveled for a great number of years, and is said to have visited parts of Europe, Barbary, Abyssinia, Egypt, Syria, Palestine, Armenia, Asia Minor, Arabia, Persia, Afghanistan, and India. Near Jerusalem, 'where,' he says, 'I associated with the brutes,' he was taken prisoner by the Crusaders, not while fighting against them, but while practising religious austerities in the desert. He was ransomed for ten dinars by a merchant of Aleppo, who recognized him, and gave him his daughter in marriage: this union, however, did not prove happy. He married a second time, and lost his only son from that marriage. The latter part of his life S. spent in retirement near his native town, and he died, at a very old age, in 690 H., or 1263 A.D.; according to others, however, he did not die until 1291 or 1292 A.D. In person, he is described as having been of rather insignificant appearance, short, slim, and spare, nor is there much to be said for his personal prowess. His was a contemplative, pious, and so to say, philosophical disposition. The years of his retirement from life

he occupied in composing those numerous works which have made him justly famous through East and West.

Although European critics would hardly be inclined to endorse to the full the judgment passed upon him by his countrymen, that he was 'the most eloquent of writers, the wittiest author of either modern or ancient times, and one of the four monarchs of eloquence and style,' yet there is no doubt that this 'nightingale of thousand songs' is deservedly held among the foremost masters of poetry, and that he fully merited the honors showered upon him by princes and nobles, both during his lifetime and after his death. A magnificent mausoleum, with a mosque and college attached to it, was erected in his honor at the gates of Shiraz, and the people, who soon wound a halo of legend around his life, flocked thither in pilgrimage; and so carefully is his tomb guarded, that when visited by Colonel Franklin in 1787, it was in the same state as when S. was buried.

The catalogue of his works comprises 22 different kinds of writings in prose and verse, in Arabic and in Persian, of which *ghazels* and *kassidas* (odes, dirges), form the predominant part. The most celebrated and finished of his works, however, is the *Gulistan*, or Rose-garden, a kind of moral work in prose and verse, consisting of eight chapters, on Kings, Dervishes, Contentment, Taciturnity, Love and Youth, Decrepitude and Old Age, Education, and the Duties of Society, the whole intermixed with a number of stories, maxims, philosophical sentences, puns, and the like. Next to this stands the *Bostan*, or Tree-garden, a work somewhat similar to the *Gulistan*, but in verse, and of a more religious nature. Third in rank stands the *Pend-Nameh*, or Book of Instructions. Elegance and simplicity of style and diction form the chief charm of S.'s writings. In wit, he is not inferior to Horace, with whose writings he, according to one source, may not have been unacquainted, since he is said to have known Latin. The first complete edition of his works, called the *Salt-cellar of Poets*, by Harrington, was published in Calcutta, 1791—1795, and has been reprinted since by native presses in India.

The *Gulistan*, first edited with a Latin translation by Gentius (Amsterdam, 1651), has been reprinted very frequently, and has been translated into a number of European tongues, into English chiefly by Gladwin, Ross, and Eastwick. The *Bostan* was first published complete in Calcutta, 1828 (Vienna, 1858), and has likewise been translated into other languages.

SAFE-CONDUCT, a passport granted, on honor, to a foe, enabling him to pass where it would otherwise be impossible for him to go with impunity. Safe-conducts are granted in war for the purposes of conference, &c.; and to violate the provisions of such a pass has always been esteemed a disgraceful breach of the laws of honor.

SAFE'D, a small town of Palestine, in the pashalic of Acre, and in the ancient province of Galilee, stands on a mountain 2500 feet high, 12 miles N. of Tiberias. The inhabitants, about 5000 in number, are engaged in the manufacture of cloth aud in dyeing, and the country in the vicinity is largely productive of wine and oil. It is an ardent wish of the Jews to die at S., because they believe that the expected Messiah will make it his capital. The Jews possess about thirty synagogues in the town, also a college for instruction in Hebrew and the Talmud. Before 1837, S. was a handsome town; but in that year it was partly destroyed by an earthquake, and more than 2000 people were killed.

SAFES, Fire-proof. The manufacture of iron safes for the preservation of money and valuable papers has become one of great importance. The foundation of the plan on which fire-proof safes are still constructed was laid by a Mr. Richard Scott in 1801. Mr. Thomas Milner in 1840 patented a fire-proof safe embodying the same principle, but with some improvements. In 1843 letters patent were granted to Messrs. Tann for the use of a mixture of pounded alum and gypsum, previously heated and cooled, as a fire-resisting medium placed between two plates of iron, from three to six inches apart, which together form the wall of the safe.

Milner's plan was to fill the jacket formed by the double-plated sides with sawdust, in which were packed a number of small tubes filled with an alkaline solution, and hermetically sealed, or crystals of alum or soda, containing from 40 to 60 per cent. of water of crystallization. In case of fire, and the safe becoming heated, the tubes burst, or the crystals melt, and saturate the sawdust with water, which becomes steam, and passes into the inner chamber of the safe, and thus protects the contents, if inflammable, from fire for a considerable length of time. Fire-proof safes are still made on the same principle. Messrs. Chubb use a mixture of alum and a mineral substance they procure from abroad. Many of the safes now made are rooms rather than boxes. A Safe Deposit Company has recently been formed in England (the idea originating in the United States); and in 1875 there was completed in London a large building, in the highest degree proof against fire or thieves, containing about 10,000 safes, which are let out to the public.—See *Protection from Fire and Thieves*, by G. H. Chubb (1875).

SAFETY-CAGE. See Mining.

SAFETY-FUSE, a species of fuse invented by Messrs. Bickford for use in the Cornish mines, and now generally employed in the chief mining districts, consists of a hollow cord of spun yarn or hemp, tarred on the outside to render it water-proof, and filled with tightly-rammed gunpowder. This fuse ignites steadily at the rate of about two feet per minute, so that the time of the explosion can be easily regulated. The use of this contrivance has contributed to prevent those accidents arising from premature explosions, formerly of very common occurrence in mines. The fuse-tube is sometimes made of gutta-percha.

SAFETY-LAMP. It has been long known that when marsh-gas or light carburetted hydrogen, which is frequently disengaged in large quantities from coal-mines, is mixed with seven or eight times its volume of atmospheric air, it becomes highly explosive, taking fire at the approach of a light, and burning with a pale blue flame. Moreover, this gas in exploding renders ten times its bulk of atmospheric air unfit for respiration, and the *choke-damp* thus produced is often as fatal to miners as the primary explosion. With the view of discovering some means of preventing these dangerous results, Davy instituted those important observations on flame which led him to the invention of the safety-lamp. He found that when two vessels filled with a gaseous explosive mixture, are connected by a narrow tube, and the contents of one fired, the flame is not communicated to the other, provided the diameter of the tube, its length, and the conducting power for heat of its material, bear certain proportions to each other; the flame being extinguished by cooling, and its transmission rendered impossible. In this experiment, high conducting power and diminished diameter compensate for diminution in length; and to such an extent may this shortening of length be carried, that metallic gauze, which may be looked upon as a series of very short square tubes arranged side by side, completely arrests the passage of flame in explosive mixtures. The following are Davy's directions regarding the structure of his lamp: 'The apertures in the gauze should not be more than $\frac{1}{22}$d of an inch square. As the fire-damp is not influenced by ignited wire, the thickness of the wire is not of importance; but wire from $\frac{1}{40}$th to $\frac{1}{60}$th of an inch in diameter is the most convenient.

Iron-wire and brass-wire gauze of the required degree of fineness, are made for sieves by all wire-workers but iron-wire gauze is to be preferred: when of the proper degree of thickness, it can neither melt nor burn; and the coat of black rust which soon forms upon it superficially defends the interior from the action of the air. The cage or cylinder should be made of double joinings, the gauze being folded over so as to leave no apertures. When it is cylindrical, it should not be more than two inches in diameter; for in larger cylinders, the combustion of the fire-damp renders the top inconveniently hot, and a double top is always a proper precaution, fixed at the distance of half or three-quarters of an inch above the first top. The gauze cylinder should be fastened to the lamp by a screw of four or five turns, and fitted to the screw by a tight ring. All joinings should be made with hard solder; and the security depends upon the circumstance, that no aperture exists in the apparatus larger than in the wire gauze.' The cylinder is protected by three external, strong, upright wires, which meet at the top; and to their point of junction a ring is attached, by which the lamp is suspended. The oil is supplied to the interior by the pipe projecting from the right side of the figure, and the wick is trimmed by a wire bent at the upper end, and passed through the bottom of the lamp, so that the gauze need not be removed for this process. When a lighted lamp of this kind is introduced into an explosive mixture of air and fire-damp, the flame is seen gradually to enlarge as the proportion of light carburetted hydrogen increases, until at length it fills the entire gauze cylinder.

Whenever this pale enlarged flame is seen, the miners should depart to a place of safety, for although no explosion can occur while the gauze is sound, yet at that high temperature the metal becomes rapidly oxidized, and might easily break; and a single aperture of sufficient size would then occasion a destructive explosion. In a strong current of air, the heated gas may be blown through the apertures of the gauze before its temperature is sufficiently reduced to prevent an explosion; but such a contingency may be guarded against by placing a screen between the draught and the lamp. It was in the year 1815 that Sir Humphry Davy presented his first communication to the Royal Society respecting his discovery of the safety-lamp; and at the meeting held on January 11, 1816, the lamp was exhibited. Sir Humphry Davy's claim as an original discoverer was immediately challenged by various persons, amongst whom may be especially noticed the late Dr. Reid Clanny of Newcastle, and the great engineer George Stephenson. Clanny's safety-lamp (which is described in the *Philosophical Transactions* for 1813) was based on the principle of

forcing in air through water by bellows; but the machine was ponderous and complicated, and required a boy to work it; moreover, he had been anticipated by Humboldt in 1796 (Weld's *History of the Royal Society*, vol. ii. p. 288, note). Notwithstanding a report of the Royal Society, dated November 20, 1817, and signed by Joseph Banks, P.R.S., William Thomas Brande, Charles Hatchett, and William Hyde Wollaston, which is totally adverse to Stephenson's claims, there is undoubted evidence that, during the very months Davy was at work on the experiments which led to his invention, Stephenson's (familiarly called the *Geordy*) lamp was actually in use at the Killingworth mines. In its general principle it was the same as Davy's, the main difference being that the Stephenson lamp had a glass cylinder inside the wire-gauze cylinder, and that inside the top of the glass-cylinder was a perforated metallic chimney; the air being supplied through a triple circle of small holes in the bottom.

On the subject of this controversy, the reader is referred to Smiles's *Life of George Stephenson*. It has been generally agreed that there is a decided advantage in having a glass cylinder besides the gauze one, to resist strong currents of air; and that glass without gauze is not safe from fracture. In the French and Belgian collieries, Mueseler's lamp is in almost universal use. It consists of a glass cylinder immediately around the flame, and of wire gauze above. An internal metal chimney opening a short distance above the flame creates a strong upward draught, which causes the feed air to yass briskly down from the wire gauze, and so keeps the glass cool and insures thorough combustion. Mueseler's lamp is also used in a few English collieries; but modifications of Davy's, Stephenson's, and in a less degree of Clanny's later lamp are still in general use in England, the best kinds of each having their wire-gauze covers secured by patent lever locks. In the catalogue of the collection of scientific apparatus shown at South Kensington in 1876, there is given an interesting table, with remarks, of the different forms of safety-lamps which either are or have been in use. It was compiled by the North of England Institute of Mining Engineers.

Closely connected in its objects with the safety-lamp is a most ingenious invention patented by Mr. Ansell of Her Majesty's Mint. Its object is to determine, by a simple application of the law of osmotic force, the presence of light carburetted hydrogen in coal mines. Mr. Ansell gives two or three forms to his apparatus, of which the following is the most simple: A thin india-rubber ball is filled with atmospheric air, and is placed on a stand under a lever which slightly presses its upper surface. This lever is connected with a spring, which it liberates when, from any cause, the lever is raised; and the liberation of the spring sets a bell in vibration. If this trap for the discovery of fire-damp is set where that gas is present to any material extent, the noxious gas enters the ball by virtue of osmose, causes it to swell, and when the swelling has attained a certain point, the warning bell rings.

The time is probably not distant when the Electric Light (q. v.) will be used in most but especially in dangerous mines. The great difficulty in the way of so applying it is that it cannot as yet, be economically divided into many comparatively small lights from one source of electricity. As it burns *in vacuo* it can be rendered perfectly safe in an explosive mixture of fire-damp and air. Some 20 years ago Mr. Holmes, the well-known electrician, invented a miner's electric lamp in which the light—equal to that of an ordinary candle—was produced by a small portable galvanic battery. Its cost was estimated at between £3 and £4. More lately MM. Dumas and Benoit have constructed a lamp the light of which is produced by a current of electricity from a Ruhmkorff coil passing through a Geissler's vacuum tube. The tube, however, really contains a highly rarefied gas such as carbonic acid, and the light has only the character of a rich phosphorescent glow. In 1881 the Earnock colliery, near Hamilton, was lighted with electric lamps on Swan's principle.

SAFETY-VALVE is a circular valve placed on an opening in the top of a steam-boiler, and kept in its place either by means of weights piled above it, by a lever of the second kind, with a weight capable of sliding along the arm, or by a lever and spring. In stationary engines, one valve is frequently found sufficient, and the pressure on the valve is produced in the first or second of the methods indicated above. In locomotive engines, on the contrary, there are always two loaded valves: one, called the *lock-up valve*, from its being out of the engineman's reach and control, is placed well forward on the top of the boiler, and kept down by weights; the other, on the hinder part of the top of the boiler, is for safety subjected to a less pressure than the lock-up valve, and is acted on by a lever and spring. The term 'safety-valve' is particularly appropriate to this invention; for whenever the tension of the steam rises above a certain amount (= the weight in pounds with which the valve is held down divided by the area in inches of the undersurface exposed to the steam), the valve is forced upwards by the superior pressure beneath, steam escapes, and the pressure on the boiler being thus relieved, the valve sinks to its place. The only precaution necessary is to be sure that the valves are not too heavily loaded or fastened; and wilful indifference, or disregard of this caution, has, especially in the case of American river-steamers, been productive of serious casualties.

SA'FFI, AZAFFI, or ASFI, a seaport of Northern Africa, in the kingdom of Morocco, and 107 miles W.N.W. of the city of that name. It is surrounded by waste and desert land; and its inhabitants, about 12,000 in number, of whom 3000 are Jews, are said to be the wildest, greediest, and mose fanatical of the kingdom. It was at one time the chief seat of the trade with Europe, and though it has declined with the rise of Mogadore, it still exports silk, wool, leather, gum, and goat-skins. The value of imports is above £100,000 a year; of exports, above £250,000.

SA'FFLOWER (*Carthamus tinctorius*), a plant of the natural order *Compositæ*, allied to Thistles (q. v.), but distinguished by its heads of flowers having only hermaphrodite florets, and the fruit having four ribs, and no pappus. It is an annual, 2—4 feet high, branching towards the top; flowers dark orange, or vermilion. It is a native of the East Indies from which it was probably introduced in a remote age into Egypt and the Levant, where it is now naturalized. It is extensively cultivated in France, and the more southern parts of Europe, and even in some parts of South America, chiefly on account of the corollas of the florets, which are used in dyeing yellow and red. In France, it is drilled or sown broadcast in the beginning of May. The plants are thinned to five or six inches apart; and the flowers are picked by the hand in dry weather, and very carefully dried on a kiln, under pressure, and are thus formed into small round cakes, in which state S. appears in the market. The S. of Persia is generally esteemed the best; but India yields the chief part of that imported into Britain. From its resemblance to saffron, S. is sometimes called *Bastard Saffron*, and it is used to adulterate saffron. The yellow coloring matter of S. is a kind of extractive. The red coloring matter is Carthamine (q. v.). The coloring matter of Rouge (q. v.) is derived from Safflower.

The seeds of S. are bitter and very oily. They are greedily eaten by parrots and many other birds. They are sometimes used as a purgative. The oil which they contain is employed in the East Indies in cases of rheumatism and paralysis.

SA'FFRON, a coloring material, consisting of the dried stigmas of the common yellow crocus, so abundant in our gardens in early spring. It was introduced into Europe from Asia Minor, and is largely cultivated in several countries, but chiefly in Spain. In England, the crocus was unknown until 1339, when it was introduced from the East by a pilgrim; and in 1582 it was extensively cultivated for yielding S., especially in Essex, at the place now called, in consequence, Saffron-Walden. Its cultivation in Britain has almost entirely ceased, and the S. used is imported. S. is not only valuable as a coloring material, but has from very early ages had a great medicinal reputation. Homer mentions it, and Solomon associates it with spikenard and other precious drugs and spices. A large portion of the supply in ancient times was yielded by Cashmere, where it is still extensively cultivated. In addition to its other properties, it is often used as a perfume, and in flavoring as well as coloring confectionery and other articles of food. These latter are now its chief uses in Britain, where its medicinal value has long been declining. The color yielded by S. is a bright golden yellow, and is due to a peculiar principle called *Polychroite*. Its great solubility in water prevents its being used as a dye for fabrics; but its agreeable flavor, and the absence of all injurious qualities, render it of great service in coloring articles of food.

The *S. Crocus* (*Crocus sativus;* see CROCUS) differs from most of the species of that genus in flowering in autumn, not in spring. It has large deep purple or violet flowers, with the throat bearded, and the long drooping trifid stigma much protruded from the tube of the perianth. The stigmas are the only valuable part of the plant.

In its cultivation, the corms are planted in the beginning of summer in rows six inches apart, and three inches from bulb to bulb; the most suitable soil being a sandy loam, very thoroughly tilled. The stigmas are gathered by women and children, and are spread out on cloth or paper, and dried in the sun, or in kilns or drying-houses. The produce of an acre of S. is about five pounds the first year, and 24 pounds the second and third year, after which the plantation must be renewed. The price of a pound avoirdupois of S. fluctuates from £1, 5*s*. to £2, 10*s*.

SA'FFRON-WA'LDEN, a market-town and municipal borough of England, in the county of Essex, 24 miles north-north-west of Chelmsford. The church is an elegant specimen of late Perpendicular. The free grammar-school has an income of £60 a year. The chief trade is in barley, malt, and cattle. Pop. (1871) 5718; (1881) 6056.

SA'GA, an old Norse word, used to denote a tale which, originally depended on, and gradually elaborated by, oral tradition, had at last acquired a definite form in written literature. Such sagas (Norse *Sögur*), along with poetical and legislative writings, constitute the chief part of the old Norwegian-Icelandic literature. They have been divided into historical and legendary. The latter embrace partly stories universally current about heroes of the Teutonic race (e. g., the *Völsunga-Saga*), and partly stories peculiar to the Norse or Scandinavian peoples (e. g., the *Frithjofs-Saga*); while the former handle the events and personages of Norwegian and Icelandic history from the 9th to the 13th c., in numerous biographies and family records. To Danish history belong the *Knytlinga-Saga* and *Jomsvikinga-Saga;* to Swedish, the *Ingvars-Saga;* to Russian, the *Eymunds-Saga*. The Faröe Islanders and the Orcadians have also their own sagas. After the middle of the 14th c., when the motley literature of the church began to exercise an influence, tales were translated from foreign languages into Norse, e. g., the story of *Barlaam and Josaphat* (q. v.), which also received the name of sagas. Bishop P. E. Müller, in his *Sagabibliothek* (Copenh. 1817—1820), was the first who subjected the whole subject of saga-literature to a critical treatment. Since his time, collections both of the historical and legendary sagas, with critical apparatus more or less complete, have appeared in all the countries of the north.—The German *Sage* is the same word, and expresses fundamentally the same idea as the Norse *saga*. The difference is this, that the Germans do not restrict its application to the legendary or traditional literature of their own country, but extend it to that of others.

SA'GAN, a town of Prussian Silesia, 48 miles north-west of Liegnitz, on the Bober, and on the Hannsdorf and Glogau Railway. Pop. (1880) 11,373, who manufacture cotton and woollen cloths, and paper, and trade in yarn, cattle, and corn. In the manufacture of woollen cloths alone, 1600 men are employed.

SAGE (*Salvia*), a genus of plants of the natural order *Labiatæ*, and containing many species, herbaceous and half-shrubby. There are only two perfect stamens, the filaments of which bear at their summit a cross thread—the much elongated *connective*—fastened by a joint, and having one cell of the anther at the upper end, and the other but imperfect cell at the other end. The seeds of many of the species, when steeped in water, become covered with a mucilaginous slime, like quince seeds.—COMMON S., or GARDEN S. (*S. officinalis*), grows on sunny mountain slopes and rocks in the south of Europe, and has long been in general cultivation in gardens. It is a half-shrubby plant, seldom more than two feet high, with ovate-oblong or lanceolate, finely notched, curiously wrinkled, whitish-gray leaves, and racemes of purplish blue, rarely white or red flowers. The whole plant has a peculiar, strong, penetrating aromatic smell, somewhat resembling that of camphor, and a bitterish, aromatic, somewhat astringent taste. It contains much essential oil (*Oil of S.*), which has been sometimes used in liniments for rheumatism. *S. leaves* are much used in flavoring dishes, and in sauces, &c. The leaves and young shoots are used for astringent tonic gargles. *S. tea*, made of the dried leaves and shoots, is a popular astringent and tonic. S. grows best in a dry soil, and is easily propagated by slips or cuttings.—CLARY (q. v.) is a species of sage.—MEADOW CLARY, or MEADOW SAGE (*S. pratensis*), is a common ornament of meadows and borders of fields in most parts of the continent of Europe, and in the south of England. It has bluish purple flowers. It is sometimes fraudulently put into beer, to make it more intoxicating.—The APPLE-BEARING S. (*S. pomifera*) is a native of the south of Europe and of the East, remarkable for its very large reddish or purple bracts, and for the large gall-nuts which grow on its branches, as on the leaves of the oak, and which are known as *S. Apples*, have an agreeable aromatic taste, and are brought to market and eaten.—Some of the species of *Salvia* have very beautiful flowers, and are prized ornaments of gardens and greenhouses.

SAGHALI'EN, spelled in all Russian accounts Sakhalin (q. v.).

SA'GINAW BAY, an arm of Lake Huron, extends south-west, and forms an important indentation of the shore of Michigan State, U.S. It is 60 miles long by 30 wide, with several fine harbors and picturesque islands. The water, like that of the whole lake, is of wonderful clearness and purity. The bay is named from the river Saginaw which falls into it.

SAGO is a nutritive substance obtained from several species of palms, especially the *Metroxylon Sagu*, which abounds in Ceram and the west coast of New Guinea. It grows also in Sumatra, Borneo, Celebes, Timor, Buro, and other islands of the Indian Archipelago. In many of these islands, sago is the chief article of food, and by the Alfoers and Papuans is made either into a gruel or baked into cakes. The sago-tree is first a shrub with several upright green branches, which, at their lower parts, are covered with thorns. After three years, these branches form one stem, and the thorns gradually disappear. The tree attains a height of from 40 to 60 feet, and within the ligneous bark it is filled with fibres and flour. It first blooms when 10 to 15 years old, according to the nature of the soil, flourishing best in a moist situation. After blooming, the flour transpires through the pores of the leaves, indicating that the tree is ripe. It must then be cut down within a year, or the flour will be lost. The stem is cut into lengths, split open, and the pith dug out and placed in a vessel with a sieve bottom. Water is applied to separate the flour and carry it into a second vessel, where it is soon deposited. The water is then run off, and the flour dried and put into little baskets made of sago-leaves. The produce of a tree averages 750 lbs. A large quantity of sago-flour is annually sent from the north-west of Borneo, the north-east of Sumatra, and Siak, to Singapore, the leading market, where it is purified and fitted for use as starch in the calico and other manufactures. In Borneo, much of the sago is granulated; and the Chinese of Malacca prepare pearl-sago which is also sent to Singapore.

Pearl-sago is in small pearly-white spherical grains, varying in size from that of a poppy-seed to a grain of millet. Granulated sago is also in round grains, but of a larger size. There are several varieties which differ much in color, some being white and others reddish-brown like radish-seed. One kind of granulated sago from India has been introduced under the name of tapioca. The method of pearling and granulating sago is not known to Europeans. S. is not entirely soluble in hot water, like ordinary starch, and can therefore be employed in making puddings, &c., and in this way forms a valuable article of food, being cheap, light, nutritious, and easy of digestion. The amount annually imported into Britain is upwards of 19,000 tons, and is valued at about £300,000. See 'Sago' in *Journal of the Ind. Archip.*, vol. iii.; *Tijdschrift van Ned. Indië*, 8th year, vol. i., see 'De Sagoboom.'

SAGOU'IN (*Callithrix* or *Saguinus*), a genus of American monkeys, having a long but not prehensile tail, a small and rounded head, short muzzle, and large ears. They are of small size, and remarkably active and graceful in their movements. They are sometimes called *Squirrel Monkeys*. They are of very gentle disposition, and when tamed, become strongly attached to their masters. Both body and tail are covered with beautiful fur. The SIAMIRI or TEE-TEE (*C. sciureus*), a native of Brazil and Guiana is one of the best known species.

SA'GUA-LA-GRA'NDÉ, a town of Cuba, on the river Sagua, about 12 miles from its mouth, which is on the north coast of the island. It is a town of considerable importance, and is connected by railway with Villa Clara and other places. Pop. about 10,000.

SAGUENAY, a large river of Canada, falling into the estuary of the St. Lawrence, on the north side, about 115 miles below Quebec. It drains the Lake of St. John, which is nearly circular, and almost 30 miles in diameter. Its course from that lake to the Gulf of St. Lawrence is about 100 miles, and is almost a straight line. It flows between precipitous cliffs, has numerous cataracts in its upper part, and is in many places two or three miles broad. In the lower part of its course, it is less wide, but very deep, and large ships ascend it more than 60 miles to load with timber from the settlements on its banks. The name S. is sometimes also given to the principal river which falls into Lake St. John, and which is known to the Indians as the Chomouchouan and as the Assouapmoussoin. It rises about 200 miles to the west of Lake St. John. The average depth in mid-channel is 145 fathoms.

SAGU'NTUM, a wealthy and warlike town of ancient Spain, in Hispania Tarraconensis, stood on an eminence near the mouth of the Pallantias (modern Palancia). Its site is now occupied by the town of Murviedro (q. v.). Founded (according to Strabo) by Greeks from Zacynthus, it became at an early period celebrated for its commerce, and attained to great wealth. But it owes its historical vitality to the circumstance of its siege and destruction by the Carthaginians, under Hannibal, in 218 B.C. Having withstood the siege for the greater part of a year, against an army amounting to about 150,000 men, led by a general of consummate ability and indomitable resolution, the Saguntines, now most severely pressed by famine, concluded, with an act of heroic defiance and self-sacrifice, a resistance that had been characterized by the most brilliant valor. Heaping their valuable effects into one vast pile, and placing their women and children around it, the men issued forth for the last time against the enemy; and the women, setting fire to the pile they had prepared, cast themselves upon it, with their children, and found in flames the fate their husbands met in battle. The destruction of S. directly led to the second Punic war.

SAHA'RA. The immense tract of country to which this name is commonly given, has already been described under the heading AFRICA (q. v.). But the term Sahara is more correctly applied to a region of much more limited extent. The natives divide Africa north of the line into three portions—the Tell, the Sahara,

and the Desert. The Tell extends from the Mediterranean to the Atlas Mountains; the Sahara, from the Atlas to the southern region where all regular supply of water fails; and the Desert, from the southern, and not very clearly-defined frontier of the Sahara, southward almost to the water-shed of the Niger, comprising a district salt and arid, inhospitable to man and beast, although the camel may even here snatch a scanty subsistence. As to physical geography, the S. may be subdivided into the following districts—1. The Hauts Plateaux, or Steppes, a series of high levels skirting the base of the Atlas Mountains. 2. The land of the Dayats or waterless oases, stretching south to the high lands on the south bank of the Wed Mzi or Djidi. 3. The region of the southern oases, to the south of the former, and extending south till it loses itself in the Desert. The idea of flooding the natural depression in the western S. has been proposed by Donald Mackenzie, as a commercial water-way to the interior; the French government in 1880–81 had a party exploring a route for a trans-Saharan railway to unite Algiers with the Senegal and Niger region. The population of S. is estimated at about 2,850,000.—See H. B. Tristram's *Great Sahara*, Nachtigal's *Sahara and Sudan* (1879).

SAHARANPU'R, or SUHURUNPUR, a town of British India, North-west Provinces, the chief place of a district of the same name. It is situated in a plain in N. lat 29° 58′, and E. long. 77° 36′, about one mile east of the Doab Canal. It has a large fort, a military cantonment, and a government dépôt. S. is about 1000 feet above the sea, and the climate is temperate during great part of the year. S. was therefore chosen as a suitable situation for a botanic garden, for plants requiring a milder climate than that of Calcutta, and one was formed in 1817. S. is described as one of the most handsome British stations in India. Pop. (1872) 43,844.

SAHIB (Arabic, companion, master, lord) is in Hindustani, the usual designation and address of a respectable European, equivalent to Mister, Sir, &c. Hence *Sahibâ* is the term for Lady, Madam. In Bengali and Mahrati, the word assumes the form *Saheb*.

SAI'DA. See SIDON.

SAID PASHA. See EGYPT.

SAIGA. See ANTELOPE.

SAÏGON, one of the finest river-ports in Asia, the capital of the French possessions in Lower Cochin China, stands on a small river of the same name, about 35 miles from the Chinese Sea. The city is fortified, and its value as a strategical position is unquestionable. By land it is defended from attack by many miles of jungle and swamp, and the approach from the sea on the south, by the fine river Donnai, could easily be rendered impassable to the strongest fleet. The entrance to the Donnai is at Cape St. Jacques, and its winding course to S., through a rich level country, is from 50 to 60 miles in length, and might be defended by fortifications at every point. It is of easy navigation, and is of sufficient depth to allow vessels of the heaviest burden to sail close to its banks under the overhanging foliage.

The breadth of the river from S. to the sea varies little, but it is never narrower than the Thames at London. It is joined on both sides by many large affluents, and it is the main channel of a river-system that covers the whole country to the south of the capital with a network of water-courses. The city of S. is fortified, and is defended by a permanent force of several large ships of war and a garrison of 10,000 men. At the beginning of the year 1865, the law of conscription, by which one man in seven is chosen from among the natives for military service, was already in force. S. consists of two parts, the Chinese town, four miles inland, filled with an active population busily engaged in trade; and the European, or fortified town on the banks of the Saïgon. The latter, with its fleet of vessels riding at anchor in mid-stream, is already of considerable size. Good roads have been constructed for many miles around, and there are barracks, hospitals, official residences, and other buildings for public purposes. The soil, only about one-fourth of which is under cultivation, is abundantly fertile, and is admirably suited to the production of cotton, sugar, indigo, and tobacco, besides rice, the principal export. Its forests contain magnificent timber, and abound in woods rich in dyes. Many handsome public buildings have been erected. There is a naval yard and arsenal, and ship-building is carried on. Pop. estimated at 70,000.

S. together with part of the territory of which it is the capital, was taken by the French in 1860. Treaties of peace and commerce, concluded with the Anamite government, in 1864, provided that the protectorate of the six provinces of Lower Cochin-China should remain in the hands of France; that three important ports on the coast of Anam should be opened; and that a space of nine kilometres on the shore of each port should be conceded to the French for the establishment of factories; that French merchants and missionaries should be allowed to traverse the kingdom of Anam without hindrance, and that an indemnity of 100 millions of francs should be paid. In 1867, in consequence of fresh aggressions, encouraged by the government of Anam, the French took the town of Vinh-long, and, by a new treaty, added three other provinces to their dominions, which now extend from 9° 5′ to 10° N. lat., and from 105° to 107° E. long. Pop. (1878) 1,592,000. The revenue of the colony is about 15,000,000 francs. The yearly imports and exports are each about 12,000,000 francs.

SAIL. A sail is an expanse of canvas, matting, or other strong material, on which the wind may exert its force and propel the vessel. A sail is extended by means of a mast or yard, or both. It may be of various shapes, and of any size, according to the carrying power of the vessel. A vessel of shallow draught or of narrow beam can bear comparatively little sail; while a vessel of proportionately deep draught and heavily ballasted—as a yacht—or a vessel of great breadth of beam, can carry sail of great area. A sail acts with the greatest power when the wind is directly astern, as in fig. 1; but it can be applied, though with less strength, when on either beam. The action of the wind on an oblique sail is a good example of the resolution of forces. See COMPOSITION AND RESOLUTION OF FORCES, &c. Let TD, fig. 2, be a ship, PAS its sail, WA the direction of the wind, and let

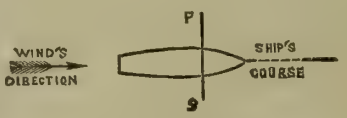


Fig. 1.

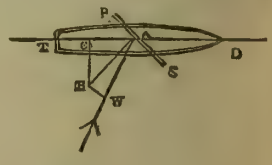

Fig. 2

the length of WA represent the pressure of the wind on the sail. WA can be resolved into AB perpendicular to the sail, and BW parallel to it, the latter of which has no effect in pressing on the sail; therefore AB is the effective pressure on the sail. Were the vessel round, it would move in the direction BA. Let BA be resolved into CA and BC, the former, CA, acting in the direction of the keel or length of the vessel, or in the direction CAD, and the latter perpendicular to it, or in the direction of the breadth. The former pressure, CA, is the only pressure that moves the vessel forward, the other, BC, makes it move sideways. From the form of the vessel, however, this latter force, BC, produces comparatively little lateral motion; any that it does occasion is called *leeway*. It results, therefore, that with the wind exerting an oblique pressure, the actual progress will be to the power of the wind only as CA to WA.

In the East and the Mediterranean, sails are frequently made of strong matting; but among northern nations, and for ocean navigation, very strong cloth, or canvas, called *sailcloth*, is usually resorted to. It is woven narrow; and the many breadths in the sail are joined by carefully made double seams.

Sails are nearly always either triangular or quadrilateral, but not necessarily equiangular. The commoner forms are shown in fig. 3. To give greater strength, a strong rope or cord is sewn

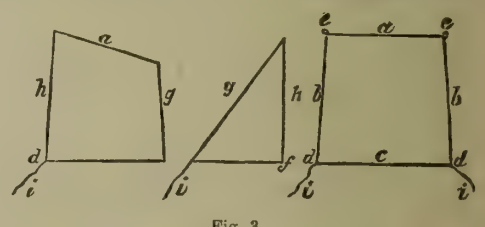

Fig. 3.

a, head ; *b*, leech ; *c*, foot ; *d*, clew ; *e*, earrings ; *f*. clew ; *g*, fore-leech ; *h*, after-leech ; *i*, sheet.

into the outer edge all round the sail; this rope has eyes in it, to which the various ropes employed in connection with the sail are fastened. The top of a sail is its *head;* the bottom, its *foot;* and the sides are *leeches;* the upper corners are termed *ear-rings;* the lower corners of a square sail, and the after lower corner of other sails, *clews;* the front lower corner of a fore-and-aft sail is the *tack*. The ropes from the lower corners, used in tightening the sail against the wind, are the *sheets*.

The sails of a ship are either 'square' or 'fore-and-aft.' The square-sails—beginning from below—are, the *course*, the *topsail*, the *topgallant-sail*, the *royal*, and, though very rarely used, the *sky-scraper*. Each has the name of the mast, on which it is set prefixed, as 'fore-topsail,' 'main-royal,' &c. The square-sails are made fast by their heads to yards, the foot being drawn to the extremity of the yard below. Fore-and-aft sails are the *spanker* or driver, extended by the gaff at its head, boom at its foot, and mast on its fore-leech; the *staysails*, which are suspended by rings to the stays, and the *Jibs* (q. v.).

In a three-masted vessel, the sails of most importance are the main-course, the spanker, the top-sails, the fore-stay-sail, and the

jibs, which can usually be all distended to the full without taking wind from each other. In very light winds, when every breath is of consequence, the area of the sails is increased by setting the *studding-sails*, which are oblong sails set on each side of the square-sails, on short booms run out beyond the yards of the latter. Fig. 4 represents a square-rigged ship with the whole of her canvas shown.

In small craft and boats, the most common sail is a lug-sail (see LUGGER), which is a small square-sail, occasionally supplemented by a shoulder-of-mutton (triangular) sail on a shorter mast at the stern. Cutters or sloops carry a large spanker, with a topsail of similar shape, and jibs; some having the power of setting a large course when the wind is astern; but it is obvious that the course and spanker cannot be used together. A schooner uses the same

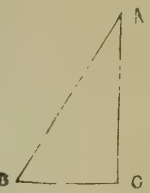
sails as a cutter, except that, in one form she carries a square top-sail and top-gallant-sail on the foremast.

Sails are furnished with rows of short ropes for the purpose of *reefing* them, when their area is too large for the wind. The effect of a sail is increased by wetting it, as the pores of the canvas close more tightly through the swelling of the hemp.

SAILCLOTH, a very strong fabric, woven generally with linen yarn, but in America it has been made wholly of cotton; and in this country, under Armitage's patent, of cotton and linen mixed. Hair—such as of the ox, horse, and deer—has also been used, under Taylor's patent, in 1832, but without success. Linen and hempen cloths are those generally used in all parts of Europe.

SAILINGS, the technical name in Navigation for the various modes of determining the amount or direction of a ship's motion, or her position after having sailed a given distance, in a given direction. The direction of a ship's motion is her *course*, and is expressed in terms of the angle between the line of direction and the meridian; the length of her path is the *distance;* the distance in nautical miles, made good to the east or west, is the *departure*, and is measured along a parallel; the *difference of latitude* is an arc of the meridian intercepted by the parallels, one of which passes through the place sailed from, the other through the place sailed to; and the *difference of longitude* is an arc of the equator intercepted by meridians through the same two places. It will at once be seen that if a ship sails along a meridian, the difference of latitude becomes the course, and there is no departure or difference of longitude; and that if it sails along a parallel the departure will be the same as the distance, and there will be no difference of latitude.

The two general questions which present themselves to the navigator for solution, are—1. Given the course and distance from one place in given latitude and longitude to another place, find the latitude and longitude of the other; and 2. Given the latitude and longitude of two places, find the course and distance from the one to the other. The simplest way in which such problems can be solved is by the method known as *plane sailing*, a method, however, which is only roughly approximate, assuming, as it does, that the surface of the sea is a plane; it is consequently applicable only to short distances and low latitudes where the meridians are nearly parallel. According to 'plane sailing,' the elements of a ship's path are represented by a right-angled plane triangle, as ABC (fig.), where AB is the distance, the angle BAC the course, AC the difference of latitude (AC being a portion of a meridian, and BC of a parallel of latitude), and BC the departure. The two problems given above are in this method merely simple cases of the resolution of a right-angled plane triangle (see TRIGONOMETRY), for if the course and distance are given, the *dif. of lat.* = distance × cos. of course, and *dep.* = dist. × sin. of course; while the idea of *dif. of long.*, as distinct from dep., is quite inadmissible, since the method presupposes that the ship is sailing on an absolutely flat plain. If the ship does not stand on one course, but changes from time to time, the calculation of her final position may be effected, either by the previous method, repeated for each change of course, or more conveniently, by the method of *traverse sailing*. This method consists in the resolution of a ship's course and distance into two courses and distances, the courses being in the direction of some of the four cardinal points of the compass; thus, a ship which has sailed S.-W.-by-S. for 24 miles, has made 20 miles of *southing*, and 13·3 miles of *westing*.



The *traverse table* has consequently six columns, the first containing the courses; the second, the corresponding distances; while the third and fourth contain the difference of latitude for each course, which, if N. is put in one column, and if S. into the other; the fifth and sixth columns, marked respectively E. and W., contain in a similar manner the departure for each course. When the table has been made out for the various courses and distances, the columns of dif. of lat. and departure are summed up, and the difference between the third and fourth, and between the fifth and sixth columns, gives the dif. of lat. and departure between the place sailed from and the place arrived at from which the course and distance made good can be calculated as before. When a current interferes in any way, either by accelerating or retarding the ship's motion, its effect is estimated as in traverse sailing, as if it were one course and distance, the *set* of the current being the course, and its *drift*, i. e., its rate per hour multiplied by the number of hours it has affected the ship, the distance.

Parallel sailing may be employed when a ship sails between two places, on the same parallel of latitude, in which case, if her head be kept accurately and constantly in an east or west direction, she will describe an arc of the parallel between the two places. As in this sailing the departure is the same arc of the parallel that the difference of longitude is of the equator, the *dep.* (which is now the *distance*) = *dif. of long.* × *cos. of lat.* The other elements are found as in plane sailing.

Middle Latitude Sailing is the application of the principle of parallel sailing to the case in which the ship's course is not perpendicular but oblique to the meridian; it is merely an approximate method, coming very close to a true estimate in low latitudes for any course, and in all latitudes for a course nearly E. and W. (i. e., one in which the distance is large as compared with the difference of latitude), but erring widely under other circumstances, though errors may be diminished as much as we please by dividing the distance into portions, and calculating the dif. of long. for each. The object of this sailing is to deduce the dif. of long. from the dep., and *vice versâ*, on the supposition, that the whole departure has been made good along the parallel of latitude which is equidistant from each extremity of the course, a method which, at first sight, would seem to give a correct result, and would do so if the parallels of latitude increased uniformly, which they do not. The dep., when laid off along the parallel of middle latitude, always gives the dif. of long. too small, and hence the limitations above noticed. When the latitudes are of the same name, the middle latitude is half their sum; but when of con-

trary names, it is better to find the dif. of long. for the portion on each side of the equator separately, the two middle latitudes being respectively half the latitude of the place sailed from, and half that of the place sailed to. The formulas are the same as for parallel sailing and plane sailing.

Mercator's Sailing is a perfect method of obtaining the same result as is found approximately by middle latitude sailing, but in the former case the dif. of long. is found from the departure, while in this method, the difference of latitude is employed for the same purpose. A table of meridional parts, as it is called, is necessary; this table shows the number of minutes in Mercator's projection (see MAP) corresponding to each degree and minute of latitude up to 78°, and is employed as follows. The latitude sailed from, and that reached, being known or found, the meridional parts for each are obtained, and their difference, if the latitudes are of the same name, or sum if of opposite names, gives the dif. of lat. We have then a right-angled triangle, with the dif. of lat. and dif. of long. forming the two smaller sides, and the vertical angle representing the course, whence *dif. of long.* = *dif. of lat.* × *tan. of course.* This sailing is the one most generally employed by navigators, but is inferior in practice to middle-latitude sailing, in the cases noticed under that head, for though it be a perfect, and the other merely an approximate method, yet a small error in the course (if large), or in the dif. of lat., becomes greatly magnified in the dif. of long.; while in the case of the latter, a considerable error in departure is hardly magnified, and a large error in the course (if nearly E. and W.) becomes imperceptible in the dif. of long. It is, however, better to work the problem according to both methods, and then estimate the true result as nearly as possible.

Great Circle Sailing (q. v.), the most perfect of all methods for finding a ship's course, is separately noticed. See also SPHEROGRAPH.

The obstacles that interfere with the correctness of the mariner's calculations are chiefly those which affect his data, the course and distance, the more important being the magnetic deviation of the compass produced by the attraction of the ship, errors in the estimated leeway or in the set and drift of currents, &c.; all of which require to be taken into account. The necessity for frequently checking the *Dead-reckoning* (q. v.), by means of astronomical observations, is sufficiently apparent.

SAI'NFOIN, or SAINTFOIN (*Onobrychis sativa*), a plant of the natural order *Leguminosæ*, suborder *Papilionaceæ*, of a genus nearly allied to *Hedysarum* (see FRENCH HONEYSUCKLE), but having one-seeded pods, which are marked with wrinkles or pits, and are more or less prickly-toothed at the margin. It is a spreading perennial, about 2 or 3 feet high, with leaves of 9—15 smooth acute leaflets, and spikes of beautiful flesh-colored flowers, striated with rose-red, on long stalks. It is a native of the continent of Europe and of the south of England, and is much cultivated as a fodder-plant in dry, and particularly in calcareous soils, to which it is admirably adapted. Its cultivation was introduced into England in 1651; and before the introduction of turnip-husbandry, the sheep farmers of the chalk districts depended almost entirely upon it, as they still do to such a degree, that in many leases there is a stipulation for the tenant's leaving a certain extent of land in sainfoin. It is, however, a very local crop, being scarcely cultivated on any but the most calcareous soils, where nothing else is nearly equal to it, although it has been found to succeed well on any soil sufficiently dry.

There is no more nutritious fodder than S., whether for sheep, oxen, or horses. Even the dry stems of a crop which has produced seed are readily consumed by cattle, if cut into small pieces. S. sometimes endures for 10, or even 15 years on the same land—more generally only for 4 to 7 years; and in the eastern counties of England it is often sown instead of clover on light and somewhat calcareous sands and sandy loams, and the ground is ploughed again in two or three years.—The name S. is perhaps rather *Sangfoin*, from the blood-color of the flowers, than *Saint-foin* (Holy Hay).

SAINT A'LBANS. See ALBANS, SAINT. (Other names beginning with *Saint*, and not given under that word, will similarly be found under the other part of the name.)

ST. A'LBAN HALL, OXFORD, takes its name from Robert de St. Alban, a citizen of Oxford, who conveyed the building to the nuns of Littlemore, near Oxford, in 1230. On the dissolution of the nunnery, it was given by King Henry VIII. to his physician, George Owen, D.M., who conveyed it to Lord Williams of Thame, and Sir John Gresham. By their assignees, it was finally transferred to the Warden and Fellows of Merton College, and was some time after established as an academical Hall. The principal of this, as well as of the other four halls, is assisted in his duties by a vice-principal and other officers appointed by himself.

SAINT AMAND, a town of France, in the dep. of Cher, stands on the right bank of the river of that name, 27 miles south-south-east of Bourges. It has a trade in iron. Pop. (1876) 7719.

SAINT AMAND, a small town of France, in the dep. of Nord, 8 miles north-west of Valenciennes. The town contains hot sulphur-springs; and lace, clay-pipes, and porcelain are manufactured. Pop. (1876) 7243.

ST. ANDREWS. See ANDREWS, ST.

SAINT ANTHONY'S FIRE. See ANTONY, SAINT.

ST. ARNAUD. See LEROY.

SAINT AU'GUSTINE, an ancient Spanish town on the east coast of Florida, U. S., is built on the western shore of an estuary 2 miles from the Atlantic, 160 miles south of Savannah. It enjoys a mild and equable climate, and is a resort for consumptive invalids. It was founded in 1565, and is the oldest town in the United States. Pop. (1870) 1717; (1880) 2500.

SAINT AU'STELL, a small town of Cornwall, 13 miles north-east of Truro by railway. Woollen goods are manufactured, and at the bay of St. Austell, from which the town is about a mile distant, there is a pilchard-fishery, and tin and copper are exported. Pop. (1871) 3803; (1881) 3612.

ST. BEES, an ancient village of Cumberland, pleasantly situated on the bay formed by *St. Bees Head*. It is 4 miles south of Whitehaven, and about 10 miles beyond the limits of the Lake district. St. Bees is a station on the Whitehaven and Furness Junction Railway. The parish is very large, comprising town and port of Whitehaven, village of St. Bees, and several chapelries and townships. The village of St. Bees contains about 1100 inhabitants. According to tradition, preserved by the early chroniclers, St. Bees originated in a nunnery founded here, 650 A.D., by an Irish saint named Bega, of whom Sandford's MS. (in the Dean and Chapter Library, Carlisle) records a very pretty legend. It appears to have been destroyed before the reign of Henry I., in whose time we find that Ranulph, Earl of Cumberland reconstituted it as a priory; but after the dissolution of the monasteries, it went to ruin. The institution known as ST. BEES COLLEGE was established in 1816 by Dr. Law, then Bishop of Chester, to supply a systematic training in divinity to young men desirous of ordination, whose means were inadequate to defray the expenses of a university education. The bishops of the province of York had previously been compelled to ordain a number of such men as literates, the poverty of many of the northern benefices not securing a sufficient supply of graduates. A portion of the ruined priory of St. Bees was fitted up by the Earl of Lonsdale as lecture-rooms, library, &c. On the recommendation of the bishop, an incumbent was selected for the perpetual curacy of St. Bees (value, £100 per annum) by the patron, the Earl of Lonsdale, with a view to his holding the position of Principal of the College in connection with the living. The Principal selects his own staff of lecturers. The expenses are defrayed from the fees paid by the students—£10 each term. The College course extends over two years, each divided into two terms, from about January 28 to May 5, and August 25 to December 5. During this period, the standard English divinity works, with the Greek Testament, are chiefly studied, and the composition of sermons, &c., practised.

The students reside in lodgings in the village, under the control of the Principal, and attend the service daily in the parish church, the transepts of which were restored in 1855 for their accommodation. A new lecture-room and library were built in 1863, adjoining the ancient structure. Students are admitted at the age of 21, on producing testimonials of character, &c., satisfactory to the Principal. Graduates of a university where there is no divinity course, are admitted to the second year's course on producing their diploma, along with the usual testimonials as to their fitness for the ministry. Students who have passed the course are not now confined to the northern province, as was the original design, but are admitted into most of the southern dioceses. The average number of students in the college is about 100. Near the church is an endowed grammar-school. St. Bees is in some repute as a sea-bathing place.

SAINT CA'THERINE'S, an incorporated town of the province of Ontario (formerly Canada West), Canada. It is on the Welland Canal, and is a station on the Welland Railway. The town is very flourishing, and has large manufactures of machinery and agricultural implements. The surrounding country is very picturesque. The well-known mineral well of St. C.'s, whose water is of great value as a remedial agent, supplies on an average 130,000 gallons a day. Of these waters, a large quantity, partially evaporated, is sent out through the country. A second well, similar to the first, is also in use. St. C.'s has been called the Saratoga of British America. Its hotels are equal to any in the province. St. C.'s is 33 miles to the south of Toronto, and 12 miles from Niagara Falls. Pop. (1871) 7864; (1881) 9631.

SAINT CROIX, an American river, called also the Passamaquoddy, which, flowing out of Grand Lake, on the eastern border of Maine, runs east-south-east 75 miles to Passamaquoddy Bay, and forms a portion of the boundary between the United States and New Brunswick.

SAINT DOMI'NGO. See HAYTI.

SAINT DOMINGO BARK. See CARIBBEE BARK.

SAINTE-BEUVE, CHARLES-AUGUSTIN, a French poet and critic of great eminence was born at Boulogne-sur-Mer, on 23d December 1804. His father, who died two months before his birth, was *principal des droits réunis* at that port. His mother, a woman of superior character and intelligence, was by family originally English, and through her the boy early acquired a familiarity with the English language and literature. He was educated at an institution of his native place, and afterwards at the Collége Charlemagne in Paris. On leaving college, though his bent towards literature was already pronounced, he was shy of committing himself to it as a profession, and betook himself to the study of medicine and anatomy. Shortly, he obtained a situation at the Hospital St. Louis. Here for some time he worked steadily; but his spare time was occupied with literature; and his articles contributed to the *Globe* on topics of history, philosophy, and criticism, attracted attention, and in particular procured him the acquaintance of the celebrated M. Jouffroy. While he was thus wavering between literature and the claims of a profession distasteful to him, Victor Hugo's *Odeset Ballades* were published, and the impression made upon him by this work, of which he wrote an enthusiastic *critique*, seems to have determined him finally to a life exclusively literary.

He gave up his situation at the hospital, and attached himself to *Le Cénacle*, along with Alfred de Musset, the two Deschamps, and others of the so-called Romantic School. Shortly, he gave to the world his *Tableau Historique et Critique de la Poésie Française, au XVI.e Siècle* (1828—afterwards enlarged in ed. 1843), which at once established his reputation as one of the first critics of the time. His next work *Les Poésies de Joseph Delorne*, though somewhat coolly received by the public, brought him what perhaps pleased him better than any of the applause of the multitude, the emphatic approval of Béranger and others of the literary guild. *Les Consolations*, published in 1830, was considerably more successful in hitting the taste of the public. On the cessation of *Le Cenacle*, after the revolution of 1830, S. attached himself to the *Globe;* and subsequently, he wrote much in the *Revue des Deux Mondes*, the *National*, and the *Constitutionnel*. In 1834, appeared his *Volupté*, a work curious as a study of moral pathology, but more curious than pleasing; and in 1840, he published the first volume of his *Histoire de Port Royal*, a work which, in 1860, he completed in five volumes. On 27th February 1845, he received the most distinguished mark of honor which can fall to a Frenchman of letters, by his election to be a member of the Academy. In 1850, he began to issue, in the pages of the *Constitutionnel*, the famous series entitled *Causeries de Lundi*, the most delightful of all his works, and that by which he is most widely known. After the *coup d'état* of 2d December 1851, he became connected with the *Moniteur*, and was appointed Professor of Latin Poetry at the Collége de France. Of this appointment some fruits are before the world in his *L'Etude sur Virgile*, published in 1857. In 1865, he was called to be a member of the Senate. He died November 1869.

As a poet, S., despite the fine talent he displayed, never succeeded in becoming popular, nor can very high rank be accorded him. But as critic, he was 'himself alone,' and his place is by common consent in the very fore-front of French literature. His sympathies were wide and catholic; in delicacy of perception, and subtlety of refined analysis, he was almost without a rival; his style is piquant, lively, fascinating, instinct with individual expressiveness; and nothing can exceed the felicity with which the interest of criticism proper is combined in his sketches with that of anecdotic biography.

Of his works not already glanced at, the following only need be mentioned: *Poésies Complètes* (1840); *Critiques et Portraits Littéraires* (1832—1839); *Portraits Littéraires* (1844); *Portraits Contemporains; Causeries de Lundi* (1851—1857); *Nouveaux Lundis* (1863); *Souvenirs et Indiscrétions. Le Dîner du Vendredi-Saint* (1872). A selection from the *Causeries de Lundi* has been translated into English, with an introduction, under the title *English Portraits* (1875).—See *C. A. Sainte-Beuve, sa Vie et ses Œuvres*, by D'Haussonville (1875); and an article in No. 281 of the *Quart. Rev.*

SAINTE-CLAIRE DEVILLE, HENRI ETIENNE, French chemist, was born in March 1818, at St. Thomas, West Indies, and was educated in France. On quitting college, he constructed at his own cost a chemical laboratory, and for nine years, without master and without pupils, devoted himself to patient studies and skilful researches. In 1844, he was commissioned to organize the Faculty of Sciences of Besançon, of which, in the following year, he was appointed Dean and Professor. In 1851, he obtained the chair of Chemistry in the Ecole Normale, which he resigned in 1880. In 1853, he became a member of the Faculty of Sciences of Paris. In 1861, he was chosen a member of the Academy of Sciences of the Institute. He died 1st July 1881.

S. D.'s earliest investigations relate to different essences and resins, and the most important are in the department of mineral chemistry. In 1849, he made known the mode of preparation and the properties of anhydrous nitric acid, a compound whose existence had been up to that date ignored. In 1852, he published an important paper on Metallic Carbonates and their Combinations; and in the following year, a new method of mineral analysis, known as the middle way, in which he proposes the exclusive employment of gases and volatile re-agents, against the errors arising from the use of the filter.

About the same time, he began his researches into aluminium, a metal discovered in 1827 by Wöhler of Göttingen, but still very imperfectly known, and set forth its special properties. Being commissioned by Louis Napoleon to seek the best method of obtaining aluminium at a low price, he made numerous experiments, jointly with M. Debray, in the factory at Javel; and after some months, succeeded in producing ingots of the metal, which were shown in the Exposition Universelle of 1855. These experiments, and the properties of aluminium, have been described by S. D. in scientific periodicals; and among his later papers are—on the Three Molecular States of Silicium; on the Metallurgy of Platina; on the Density of Vapors at very High Temperatures; on the Measurement of High Temperatures; on the Permeability of Iron to Gases at a High Temperature; on the Phenomena of Dissociation in Homogeneous Flames; and on the Industrial Preparation of Aluminium and its Compounds. These papers are published in the *Mémoires* and *Comptes Rendus* of the Académie des Sciences de l'Institut, and in the *Annales de Chimie et de Physique*.

SAINTE MARIE-AUX-MINES (Ger. *Markirch*), a town of Germany, in Alsace, on the Liepvrette, 12 miles north-west of Colmar, at the foot of the Vosges Mountains. It formerly owed its prosperity to its silver mines, but these are no longer worked. Its chief manufactures are cotton fabrics of various kinds, paper, and cherry-brandy. Pop. (1871) 12,319; (1880) 11,524.

SAINTES, an old town of France, in the dep. of Charente-Inférieure, on the left bank of the Charente, 43 miles south-east of La Rochelle. In ancient times, this town, under the name of *Mediolanum*, was the capital of the Santones, from whom the subsequent province derived the name of Saintonge. It contains interesting Roman remains, as a triumphal arch, and the ruins of an amphitheater, circus, &c. Pop. (1876) 11,150.

SAINT GEORGE'S ENSIGN is the distinguishing flag of the British navy. It consists of a red cross on a white field, with a union-jack in the dexter chief corner, as shown in fig. 2 of the article FLAG. Formerly it was usual that an admiral, vice-admiral, or rear-admiral should have his flag red, white, or blue, according to the squadron to which he belonged. By a regulation of 1864, this old custom was altered; the squadrons are abolished, and the white Saint George's ensign is the badge of all ships in the navy. The red and blue ensigns are now left to government vessels—not being ships of war—and merchant vessels respectively. The ensign is borne at the peak, or, in harbor, on a flagstaff at the stern; in boats, the latter is the only mode of flying it. A full-dress ensign is the largest flag used, being often but little smaller than the quarter-deck of the ship which hoists it.

SAINT-GERMAIN-EN-LAYE, a town of France, in the dep. of Seine-et-Oise, on an elevation on the left bank of the Seine, 14 miles by railway west-north-west of Paris. It contains three handsome squares, a parish church, with a monument erected by George IV. over the remains of James II., several learned and other societies, and some factories. Pop. (1876) 16,978.

S.-G. had its origin in a monastery built by King Robert in the beginning of the 11th c., on the summit of the hill which was surrounded by the forest of Lyda (*Laye*), and dedicated to St. Germain. The town, as well as the royal château, which was built either during the reign of King Robert, or soon after, was sacked by the English in 1346, in 1419, and in 1438. At S.-G. the marriage of Francis I. was celebrated, and this king rebuilt the château in 1547. From before the time of Philippe-Auguste, S.-G. had been the residence of the French court during a portion of the year, but Louis XIV. transferred the court to Versailles, and from this time the fortunes of S.-G. declined. Later, the château of S.-G. was assigned by Louis XIV. as the residence of the dethroned James II. of England, and here in exile that monarch held his morose court, devoting almost the whole day to religious observances. The château is now used as barracks and for other purposes. The Forest of S.-G. comprises 10,873 English acres.

SAINT HE'LENS, a municipal borough of Lancashire, on a small affluent of the Mersey, 3½ miles north-east of Prescot by railway. It is a straggling, ill-built, but thriving town, with an extensive trade in coal. It has plate-glass, copper, and bottle works; also potteries, breweries, tan-yards, iron and brass foundries. Pop. (1861) 18,396; (1871) 45,134; (1881) 51,234.

SAINT HE'LIERS, capital of Jersey (q. v.), the chief of the Channel Islands, is situated on the south shore of the island, and on the east side of St. Aubin Bay, lat. 49° 11′ N., long. 2° 6′ W. It is defended by Elizabeth Castle, on a rocky island off the shore, approached by a causeway at low water; and by Fort Regent, on the south-east side of the town, built about 1806, on a scarped granite rock, at an enormous expense. In the year 1867 a great extension of the harbor works was found to be necessary. At spring tides, the water rises 40 feet. Victoria College—a handsome edifice, built on an eminence, in 1851—the hospital, the theater, and the churches, are the chief buildings. The area of the town has rapidly increased within recent years. An active trade is carried on with England, France, and India. Pop. of town and parish (1871), 30,756, including a garrison of upwards of 500 men.

SAINT IGNA'TIUS' BEAN. See NUX VOMICA and STRYCHNOS.

SAINT-JEAN-D'ANGÉLY, a small town of France, dep. of Charente-Inférieure, 15 miles north-north-east of Saintes. Pop. (1876) 6309.

SAINT JOHN'S BREAD. See CAROB.

SAINT JOHN'S WORT. See HYPERICACEÆ.

SAINT JOSEPH, a city of Missouri, U.S., on the left bank of the Missouri River, on the eastern border of Kansas, 496 miles by water from St. Louis. Five lines of railway center here, and it has a large wholesale trade, in agricultural products, &c., amounting to 18,000,000 dollars in 1874. It has a court-house, 17 churches, a convent, several large hotels, seven newspapers, three of which are dailies, steam-mills, and factories, and a large trade with the interior of the continent. Pop. (1870) 19,565; (1880) 32,434.

SAINT JUST, LOUIS ANTOINE DE, a notable figure in the first French Revolution, was born at Decize, in Nivernais, 25th August 1767, educated at Soissons by the Oratorians, and afterwards went to Rheims to study law, but soon returned to his native village, where he devoted himself exclusively to literature. When the revolution broke out, S. J. was transported with enthusiasm, and became one of its most ardent apostles. Probably no man in France was a more genuine fanatical believer in the brilliant delusions of the period. Spotless, even austere, in his morals, reserved in manner but eloquent in speech, and rigorously earnest in his convictions, he rapidly rose into consideration among the inhabitants of his native commune, who elected him lieutenant-colonel of the National Guard, sent to Paris in 1790 to assist at the Fête of the Federation. In 1791, appeared his *Esprit de la Revolution et de la Constitution de la France*, in which the various causes of the revolution are sketched in a calm, keen, precise sort of way; and in the following year he was chosen deputy to the convention by the electors of Aisne.

S. J. entered Paris on the 18th of September, fifteen days after the frightful massacres, which Lamartine in his *Histoire des Girondins* with melodramatic inaccuracy represents him as ordering in conjunction with Robespierre! He voted for the death of the king, and in an oration full of stern but exaggerated republican sentiment, gave his 'reasons'. It was this speech that made him famous and influential. The Girondins tried to win him over, but in vain. In all the fierce debates of this period, S. J. took a leading part; but he also displayed a great capacity for administrative organization, and on the 11th of February 1793, carried his project for the formation of a committee to superintend the war. After the fall of the Girondins in June, (S. J. took no part in their overthrow, and never once spoke during the disastrous struggle between the two sections), the civil war broke out, and it is from this point that we date the exhibition of that intense and merciless republicanism which fitted him so well to be the associate of Robespierre. It is commonly thought that S. J. —perhaps because he was so young—was merely an instrument in the hands of Robespierre; but the known facts of his career lead to a very different conclusion, and some writers have not scrupled to make S. J. the real head of the extreme party who exercised government in France during the *Reign of Terror*. Almost all the energetic, or as some would prefer to say, sanguinary, measures drawn up to repress the royalists and timid republicans at home, and to repel the forces of the allied monarchs on the frontier, were devised by him. On the 19th of February he was elected president of the convention. He drew up the terrible report which led to the arrestment and execution of Hebert, Danton, and their adherents. S. J. had no scruples in cutting off his opponents. The intensity of his convictions rendered him indifferent to deeds of cruelty, however appalling. When the political reaction set in, and the party of moderation had got the upper hand in the convention, Robespierre and S. J. were seized and imprisoned (27th July 1794), and ordered to be guillotined next day. S. J. suffered with sullen calmness—not a word escaping his lips. See Ern. Hamels's *Histoire de Saint Just* (Par. 1859.)

SAINT LO, an old town of France, capital of the dep. of Manche, built on a rocky elevation on the right bank of the river Vire, 55 miles by railway south-east of Cherbourg. From the high central part, several streets, more or less steep, branch off in different directions. The town, which is said to owe its origin and its name to a St. Lô, bishop of Coutance, who caused a church to be built here in the 6th c., was destroyed by the Normans in 888, and taken by the English in 1346, and again, in 1417. Noteworthy are the beautiful churches of Sainte-Croix, founded in 805, and of Notre Dame, which dates from the 15th century. Flannels, druggets, and cotton fabrics, cutlery, and leather, are manufactured, and a considerable supply of horses for cavalry are here obtained. Pop. (1876) 9519.

SAINT LOU'IS, a port of entry of Missouri, U.S.; the chief city and commercial metropolis of the central Mississippi valley, stands on the right bank of the Mississippi, 18 miles below its confluence with the Missouri, and 174 miles above the mouth of the Ohio. It is regularly built upon the limestone bank of the river, on two terraces, rising 20 and 40 feet above high water, with wide and well-built streets running parallel to the river, crossed by others at right angles. The principal structures are a city hall, court house, custom house, arsenal, merchants' exchange, mercantile library, city hospital, post-office, marine hospital, university, cathedral, and several of the largest hotels in the world. There are 162 churches and missions, of which 38 are Roman Catholic; numerous general hospitals, asylums, and convents; the St. Louis University, under charge of the Society of Jesus, with 22 professors; the Washington University, Academy of Sciences, German Institute; 84 newspapers and periodicals, of which 10 are daily, and 12 in German; an opera-house, and 5 theaters.

Among the manufactories are flour and lumber mills, sugar refineries, lard and linseed-oil factories, provision packing-houses, manufactures of hemp, whisky, tobacco, and vast iron-foundries and machine shops which in the year 1880 produced goods valued at 250,000,000 dollars. S. L. has a vast trade by steamboats to the whole Mississippi valley, and sixteen lines of railroad center there. It is connected with East S. L., on the opposite bank of the Mississippi, by a remarkable bridge, 2225 feet long, and 54 feet wide, which was finished in 1874; it is constructed of steel and cast-iron. The new custom-house and post-office cost 5,000,000 dollars. S. L. possesses a vast traffic in agricultural produce. In 1764, it was the depot of the Louisiana Indian trading company; in 1768, it was captured by a detachment of Spanish troops; in 1804, was ceded with the whole country west of the Mississippi to the United States; the first brick house was erected in 1813. Pop. (1820) 4590; (1860) 151,780; (1870) 310,864; (1880) 350,522.

SAINT LOUIS, the capital of the French possessions in Senegambia, is situated on a small low island of the same name, at the mouth of the Senegal river. The town covers almost the whole island. With its fortifications, it presents an imposing appearance from the sea, but the interior is mean and dirty. The harbor is good. The principal building is the government house. There are 600 stores for goods. Saint L. possesses a botanic garden, founded in 1822. Pop. about 18,000.

SAINT LUCIE BARK. See CARIBBEE BARK.

SAINT MALO, a fortified seaport of France, in the dep. of Ille-et-Vilaine, at the mouth of the river Rance. It stands on a small island less than three miles in circumference, called *Le Rocher d'Aaron*, which lies close off-shore, and is connected with it by a causeway, 650 feet long, called *Le Sillon*. The island is completely covered by the town; the streets are narrow, filthy, and ill-ventilated, and the houses are built to the height of five and six stories. The harbor is spacious and secure, but its entrance is narrow, and is thickly set with rocks and shallows. It is perfectly dry at ebb-tide, but the flood-tide rises here from 45 to 50 feet. Numerous strong forts, both on the mainland and on the small islands that stud the roads, protect the harbor and town. The harbor works were completed under the second empire, and cost nearly 20 million francs. Ship-building is the principal industry. On the island of Grand-Bé, near the ramparts, is the tomb of Chateaubriand (q. v.). Many vessels are employed in the mackerel, cod, and whale fisheries, and active commerce is carried on. S. M. communicates with Rennes (the capital of the dep.) by railway. Pop. (1876) 10,061. In a single year, S. M. will export goods to the value of £1,500,000, chiefly butter, to Great Britain.

SAINT MI'CHAEL'S, the largest and most important of the Azores (q. v.), and with the exception of St. Mary's, the most

eastern island in the group. Area, 224 sq. m., or 143,000 acres; pop. about 110,000. The island is mountainous, and rises in its highest summit to 3560 feet. Of the whole acreage, 40,000 acres are arable, and about 5000 acres are pretty equally divided between orange gardens and vineyards. Hot springs abound in many parts of the island, and in the western extremity are the Caldeiras or boiling fountains, whence the water ascends in columns to the height of 12 feet and then disappears in vapor. The thermometer ranges from 48° to 84°. The annual value of the exports—by far the larger portion of which consists of oranges, and goes to Great Britain—is about £85,000; and of the imports, mainly from Great Britain, a little more. The chief town is Ponta Delgada (population about 16,000).

SAINT MICHAEL'S MOUNT, a conical and isolated rock in Mount's Bay, Cornwall, 3 miles east of Penzance. It communicates with the shore by a causeway 400 yards long, which, however, is covered with water 8 hours out of the 12. The Mount is 195 feet high, is about one mile in circumference, and is crowned by an old and picturesque castle—now used as a manorial residence—surmounted by a tower, on one angle of which there is a projecting stone lantern, popularly called *St. Michael's Chair*. At the base of the Mount is a fishing village, of about 30 houses. This hill is to the geologist one of the most curious of localities, and, indeed, it is said to have 'excited more geological controversy than any mountain of the world.' At a very early period, S. M. M. was the seat of a religious house, and the apparition of St. Michael is said to have appeared on one of its craggy heights. At the Conquest, the monastery of St. Michael was annexed to the abbey of St. Michael in Normandy. It long remained in the possession of the monks, and afterwards became the residence of several families in turn, until it was sold in 1660 to its present proprietors, the *St. Aubyns*.

SAINT MICHEL, MONT, an extraordinary rock in Cancale Bay, in the north-west of France, 7 miles south-west of Avranches. It is a solitary cone of granite, 2 miles in circumference at the base, and rising to the height of 400 feet. It rises sheer out of a level expanse of sand, and though its elevation is not great, its perfectly flat environment and its pointed crest render it a most striking feature in the landscape. It is crowned by a church and castle, under which are conventual buildings, with their lofty turrets and high walls, and lower down still are the houses of the small town. The sands are covered with water at every tide, except at neap-tides. A good road leading along a causeway about a mile in length connects the island with the mainland. Till 1880 the rock was only accessible by crossing the sands at low water; there being a firm track across the sands at low tide, with quicksands to right and left of it. In the 8th c. an abbey which replaced an ancient temple of Jupiter was founded on the summit of the rock. A church, and an almost impregnable fortress, were afterwards founded by the Normans. After the Revolution the main building was changed into a prison. The castle has recently undergone restoration.

SAINT NAZAIRE, a thriving seaport of France, in the dep. of Loire-Inférieure, at the mouth of the Loire, on the north bank of that river, and 38 miles west of Nantes, with which it is connected by railway. Almost unknown till within recent years, it is now one of the most important ports on the west coast of France. In 1851, it contained 2391, in 1861, 6500, and in 1876, 14,761 inhabitants. Here the government constructed a floating dock of 25 acres area, and another dock, of double the area, is in progress. St. N. is the port for the Trans-atlantic steamers to the West Indies and Mexico. One cause of the rapid rise of this port is, that the navigation of the Loire is becoming year by year more difficult, owing to the sand brought down by the river; so that the chief shipowners of Nantes prefer to leave their vessels at St. N., and have the cargoes transported inland by railway.

SAINT NE'OT'S, a small market town in the county of Huntingdon, 8 miles south-south-west of the town of that name, occupies low ground on the banks of the Ouse. Its beautiful parish church has a tower 156 feet high. St. N.'s has a large iron-foundry, an engine factory, breweries, steam flour-mills, &c. About a mile from the town are large paper-mills. Pop. (1871) 3200; (1881) 4261.

SAINT NI'CHOLAS, a flourishing manufacturing and market town of Belgium, in East Flanders, 20 miles east-north-east of Ghent, on the Ghent and Antwerp Railway. It stands in the midst of the Pays de Waes, a densely peopled and productive agricultural district, and is said to be the seat of the largest flax-market in the world. The market is held in the great square of the town, one of the largest in Belgium, but which, however, is too small to accommodate comfortably the immense numbers who crowd hither on market-days. S. N. is a manufacturing town of the first class; and among the articles largely manufactured are cotton, woollen and silk stuffs, carpets, hats, lace, tobacco, and pipes. There are print-fields, dyeworks, and tanneries, and a flourishing trade is carried on in shawls, linens, and other manufactured goods, as well as in flax, corn, hops, &c. Pop. (1877) 25,440.

SAINT OMER, a town of France, and fortress of great strength, in the department of Pas-de-Calais, on the Aa, 26 miles south-east of Calais by railway. It is surrounded by irregular but well-appointed fortifications, is well-built amid marshes, and contains numerous fountains and more than one important ecclesiastical edifice. Woollen cloths, blankets, pottery, and clay pipes are manufactured, and there is considerable general trade. Pop. (1876) 21,404. A college for the education of English and Irish Catholics was opened at S. O. during the penal times. It was closed, however, during the Revolution; but still exists as a seminary, and is attended by from 15 to 20 students.

SAINT PA'NCRAS, one of the northern districts of London (q. v.).

SAINT PAUL, a city, port of entry, and capital of Minnesota, U.S., is on both banks of the Mississippi River, 2080 miles from its mouth, and 9 miles below the Falls of St. Anthony; lat. 44° 52′ 46″ N., long. 93° 5′ W. It is chiefly built on the east bank upon a plain 80 feet above the river, and 800 feet above the Gulf of Mexico. Hills near the city abound with springs of excellent water. S. P. is at the head of navigation for the large steamboats of the Lower Mississippi and its branches, and the center of a large and growing trade in flour, lumber, furs, machinery, boots and shoes, oil, beer. It has a state-house, cathedral, college, and 4 daily newspapers. Pop. (1860) 10,277; (1870) 20,030; (1880) 41,473. Even since the census it has grown portentously, and in 1883 was said to contain nearly 90,000 inhabitants.

SAINT PAUL DE LOA'NDA, a considerable seaport on the south-west coast of Africa, the principal Portuguese settlement in Lower Guinea, stands at the mouth of the river Bengo, in lat. about 8° 54′ S. It is the largest and most important European settlement on this coast, and contains 12,000 inhabitants, of whom 830 are white, 2400 mixed, and 9000 black. The climate is comparatively healthy, the harbor is beautiful, and protected by one large and two small forts. The houses are good, the streets unpaved, and there are three churches and three market-places. Abundance of fruit and vegetables, bullocks, and goats are obtainable in the markets. Ivory and bees-wax are the principal exports.

SAINT PE'TERSBURG, a maritime government of Russia, one of the Baltic Provinces, between Lake Ladoga on the N.-E. and Lake Peipus on the S.-W. Area, 17,057 square miles; pop. (1879) 1,591,244. The soil is damp and thin, and woods and marshes cover two-thirds of the level surface. In the vicinity of the capital, much ground is laid out in market-gardens. The usual crops are grown, but the quantity of corn produced is greatly less than the quantity consumed. The chief town is the capital, *Saint Petersburg* (q. v.).

SAINT PETERSBURG, the capital of the Russian empire, and of the government of the same name, stands upon, and around the lower branches of, the Neva, and on the shores of the eastern extremity of the Gulf of Finland, 16 miles east of Cronstadt, its port. Lat. 59° 56′ N., long. 30° 19′ E. The Great Neva, the most southern branch of the Neva, divides the city into two great sections—the Petersburg Side on the north, and the Great Side on the south. The former is built on the islands which are formed by the delta of the Neva, the chief of which are the Vassili Ostrov, the Citadel Island, and the islands Aptekarskoi, Kammennoi, Petrovskoi, Krestovskoi, and Elaghinskoi. The Great Side, south of the Great Neva, is compactly built, and contains the residences of the court and of the nobility, and more than half the population The city covers an area of 42 sq. m., stands 56 feet above the level of the sea, upon plains which were formerly malarious marshes, but are now for the most part drained and laid out in meadows and gardens. Pop. (1863) 539,475; (1878) about 900,000.

The climate, severe in winter, is pleasant and mild in summer. The mean temperature in summer is 62°; in winter, 14° F. The extremes of temperature are 99° and—51°. Fourteen arms of the Neva, irrespective of the smaller branches, ramify through S. P., and there are seven canals.

General View of Saint Petersburg.—Approaching the city from Cronstadt (q. v.), the port and fortress of the Russian capital, the first indications of the great city are the gilded dome of the church of St. Izak, and the lofty spire of the Admiralty, which are seen rising apparently from the water's edge. The Admiralty Square, faces the English Quay, on the south bank of the Great Neva, and may be considered the center of the city. From the spire, with its numerous galleries, the whole plan of the city can be clearly seen. Right opposite it is the populus Vassili Ostrov, on the south shore of which are the Bourse, Academy of Sciences, Corps of Cadets, &c. To the north is the Citadel Island, and further north the densely peopled Aptekarskoi Island, and the Kammennoi, and other islands, which are for the most part stud-

ded with wood-embosomed villas, and laid out in charming gardens. Considering the river on the north as the chord, and the Admiralty as the center, the semicircle that might be drawn with a radius of 2½ miles, would pretty nearly describe what is called the Great Side of Saint Petersburg. This section of the city is divided into three or four portions by the Moika, St. Catharina, Fontanka, and New Canals; and it is intersected by three spacious streets, which radiate east-south-east, south-east, and south from the great center, the Admiralty. The streets are named repectively the Nevski Prospekt (Neva Perspective), Gorokhovaia Oulitza (Peas Street), Vosnosenskoi Prospekt (Resurrection Perspective.) Extensive suburbs also are rising on the eastern bank of the Neva, and there are five railway stations.

Streets, Squares, Monuments, Bridges, Churches, &c.—The street architecture of S. P., unlike that of Moscow, with its pale-yellow walls and red and green roofs, is almost destitute of color. Here the rigid, military aspect of the streets, with the houses drawn up in long regular lines of gray, or massed together in blocks like the squares of battalions, is one of the first features of the Russian capital that impress themselves upon a traveler. Except in the more fashionable quarters, the greater number of the houses are built of wood; but owing to the liability of such houses to catch fire, building in this material is very much discouraged. S. P. contains 500 streets, and among these, lanes and alleys are unknown, as, while the finest streets have a breadth of 120 feet, the narrowest are 42 feet broad. The Nevski Prospekt is the most splendid street in S. P.; and for architectural grandeur, as well as for natural beauty, for proportions, and for variety, is considered the finest street in Europe. It is 130 feet broad, and about 4 miles long, is planted on both sides with trees, contains a large number of the most beautiful palaces, of highly ornamented churches, and splendid warehouses, and increases in breadth and magnificence as it advances from the Admiralty. For the first mile, it does not contain more than about 50 mansions, each of which, however, is of colossal magnitude. The houses are built of brick faced with stucco, are three and four stories high, and are in many cases furnished with ornamental porches, colonnades, gilded balconies, and parapets that gird the flat roofs. About ten of the other streets of the city are distinguished for their grandeur, though none of them equals the Nevski Prospekt. There are 64 squares in the city, and of these the Admiralty Square is one of the most famous. It contains one mass of buildings, presenting to the Neva a fine façade, nearly half a mile in length, while its sides are 650 feet long. In the Palace Square, adjoining the Admiralty, stands Alexander's Column, an immense monolith, erected in 1834. It consists of a shaft of red granite, standing on a pedestal of the same material, and supporting a capital, above which rises the figure of an angel and a cross. The length of the shaft is 80 feet, and that of the whole column 150 feet. Peter's Square contains the noble and well-known equestrian statue of Peter the Great, 18 feet high, and erected 1768—1782. The Field of Mars, large enough to allow of 40,000 men being put through military evolutions, contains the bronze statue of Suwaroff, and a monument to Catharine II.—*Bridges.*—Of the 150 bridges that unite the islands, cross the canals, and span the Neva, the Annitchkoff Bridge, leading across the Fontanka Canal, consists of five arches, is 110 feet long, and is decorated with four spirited groups, in bronze, of wild horses and their tamers, by a native artist. The Nikolayevski Bridge, a magnificent structure in granite, and the only permanent bridge save one that crosses the Neva—the others being temporary bridges supported on boats, and removed every autumn and spring—was completed in 1850. It crosses the Neva from the English quay on the south bank to the Vassili Ostrov shore, is 1200 feet long, and consists of 7 elegant arches, supported upon ponderous piers of granite. At the northern end of the bridge, there is a drawbridge which affords a passage to ships. No part of S. P. affords a foundation solid enough to support weighty structures. The foundation for the Nikolayevski Bridge was not obtained until three sets of piles had been driven into the oozy bed of the river, the one on the top of the other, and so close that all the timbers touched each other all the way across.—*Palaces, &c.*—S. P. might be called a city of palaces, from the number of the edifices of that description which it contains. The Winter Palace, destroyed by fire in 1837, but soon after rebuilt, is certainly the largest, and, in one sense, most probably the most magnificent palace in the world. It is 450 feet long and 340 wide, has an imposing façade, and contains 800 inhabitants, and, during the residence of the emperor within it, is inhabited by 6000 people. It has numerous ample halls, decorated in the most artistic manner, and containing collections, furniture, and articles of *vertu* of immense value.

The Hermitage, situated on the Neva like the Winter Palace, is connected with that structure by several galleries. Its gallery of 2000 paintings is famous for its specimens of the Spanish school. The library of this palace contains the collections of Diderot, Voltaire, &c., and possesses in all 120,000 vols. The Annitchkoff Palace is the residence of the cesarewitch. The Imperial Library one of the first in Europe, contains 1,100,000 vols. and 35,000 MSS. The gilded tower of the Admiralty buildings, which is said to be visible from Cronstadt, and certainly forms in these flats a most conspicuous landmark, is 230 feet high. The Old and New Arsenals are surrounded by cannon taken from the Turks and Persians.—*Churches.*—S. P. contains about 350 churches, 300 of which are orthodox. Within the Citadel stands the church of St. Peter and St. Paul, finished in 1727. It is surmounted with a slender tower, crowned by a gilded spire, the whole being 345 feet high. The cathedral of St. Izak, though destitute of architectural beauty, is remarkable for its rude magnificence, and is one of the most considerable buildings of modern times, is 330 feet long, 290 feet broad, and 310 feet high. It is surmounted by a great gilded dome, and by four smaller domes. The domes are made of bronze, and the value of the plate-gold by which they are overlaid is stated at £50,000. Each of its four sides is adorned with a peristyle of 12 or 16 red granite monolith pillars from Finland. Other notable churches are the Cathedral of Our Lady of Kazan, and the Vladimir Church.

Academies, Scientific Institutions, &c.—The Academy of Sciences, with a library of 150,000 books and MSS., was founded by Peter the Great in 1725. In the Institute of Technology, founded in 1829, 200 pupils are taught silk-spinning, the manufacture of cloth, silk, and woollen stuffs, wood-carving, and engraving on copper. The University, founded in 1829, is attended by 1400 students, and has between 80 and 100 professors. The New National Museum of Antiquities, Painting, and Sculpture, completed in 1851, is a noble structure, built entirely of marble and metal. There are numerous benevolent institutions, a number of splendid theaters, and an Italian opera, a magnificent structure.

Manufactures and Commerce.—About 3000 ships annually leave the port. The exports have a value of over £5,000,000; the imports of about £15,000,000 a year. Of the manufacturing cities of Russia, S. P. is one of the most important. The principal private factories are mills for spinning and weaving cotton. The immense imperial establishments produce admirable specimens of Gobelin tapestry, mirrors, articles in bronze, playing-cards, crystal, and porcelain.

S. P. is little more than a century and a half old, and yet it takes rank among the first capitals in the world. It was founded by Peter the Great, May 27, 1703. After a long struggle against the severe climate, insalubrious from the exhalations of wide-extended marshes, and from the arctic rigor which even yet can cover the Neva with ice a yard and a half thick, at length the town was founded and declared the capital in 1712. Under the successors of Peter, the improvement, embellishment, and extension of the city were carried on. Catharine II. constructed the great canals which, while they afford means of ready communication, serve also to drain the marsh-lands, to render the atmosphere more healthy, and to mitigate the rigors of winter. The city suffered great damage and the loss of several hundred lives in 1824 from an inundation of the Neva, and every April, when the ice breaks up, the lower regions of the city are threatened with a similar disaster. At S. P., all the ministers from foreign courts are bound to reside.

SAINT PETER'S LE PORT, or commonly *St. Peter's* the chief town of Guernsey, one of the Channel Islands. See GUERNSEY.

SAINT PIERRE, the chief town, though not the seat of government, of the island of Martinique (q. v.), belonging to France, stands at the head of a bay, 16 miles north-west of the capital, Fort-la-France (formerly Fort Royal). It is the largest town in the Antilles, with a pop. of 30,000 and is the chief entrepôt of those islands.

SAINT PIERRE, a town of the island of Bourbon (q. v.) or Réunion, on the south-west coast, 34 miles south-west from Saint Denis. Pop. 14,135.

SAINT-PIERRE-LÈS-CALAIS, a town of France, in the dep. of Pas-de-Calais. It may almost be regarded as a south-eastern suburb of Calais, to which it nearly adjoins, but has grown to a size exceeding that of Calais itself. It is famous for its manufactures of Tulle (q. v.). Other branches of industry are also actively prosecuted, as the manufactures of leather and beetroot sugar. Pop. (1876) 22,349.

SAINTS, a name applied in the New Testament to the members of the Christian community generally, but restricted by ecclesiastical usage from very early times to those who, whether under the old or under the new dispensation, have been specially remarkable for their personal virtues and their eminent services to the cause of religion. Of the old dispensation, the 'patriarchs and prophets' are commonly designated as saints. But the word is used much more of the Christian Church. In the ages of persecution, the quality which most of all challenged the admiration and reverence of the faithful was natural courage and constancy in the profession and the defence of the Christian faith; and thus

the earliest of those whom the church reverences for sanctity of life, are also, for the most part, reverenced as champions of the faith. In general, however, the saints are distributed into several classes, chiefly in relation to the special services which the church has appropriated to their honor. Thus we find enumerated (1.) Apostles and Evangelists; (2.) Martyrs; (3.) Confessors, a name applied primitively to those who had exhibited great constancy in professing the faith, although without the final crown of martyrdom, but in later times understood of all who, without being martyrs, were eminent for sanctity of life; (4.) Doctors or men eminent for sacred learning; (5.) Virgins; (6.) Matrons and Widows, distinguished for holiness of life.

Anciently the character and appellation of saint was bestowed upon individuals, as it were, by acclamation, and by the common voice of the members of the particular Christian community to which the individual belonged, or to which his merits were most familiar. The earliest examples, as may be seen in the letter of the Church of Smyrna on the martyrdom of Polycarp, of such judgments as to individuals were in the case of the martyrs. Altars were erected at their tombs, and the people assembled for worship on the anniversary of their martyrdom. Even then, however, the letters of St. Cyprian (Epp. 37 and 39) show that caution was observed by the bishops to guard against the recognition of undeserving individuals. The honors of the martyrs, even before the age of persecution had passed, were extended to confessors of the faith, and eventually to all who were eminent for holiness of life, and especially to those who obtained the reputation of performing miracles. The names of those who were so honored were placed in the register (or diptych) of each church. It was not, however, till a comparatively late period that a regular form of procedure was established in the Roman Church for the purpose of testing the claim of individuals to the authentic reputation of sanctity. From the 4th c. downwards, examples of reference to Rome—as, for instance, in the Acts of Virgilius, Bishop of Trent—are cited by Catholic writers. But the first recorded example of a solemn and public decree is in the case of Udulric or Ulric, Bishop of Augsburg, to whom the honors of sanctity were adjudged by Pope John XVI. (see Hardouin, Concil. VI. P. I., p. 727) in the end of the 10th c. (993). Since that time the procedure of the Church of Rome as to the public recognition of the saints has been matured and methodized. It consists of two stages, that are called respectively 'Beatification' and 'Canonization.' The former is but a preliminary process, and consists in a declaration by the pope that the 'beatified' person is entitled, by reason of his (or her) eminent virtues, attested by miracles, to be regarded as a saint, and as such honored and invoked.

This authorization, however, is not in beatification extended to the entire church, but is always limited to a particular church, or province, or religious order; and the nature of the honors permitted to be paid to the beatified person is strictly defined either by the terms of the decree, or by local usage, if such have already existed. But although the effect of a decree of beatification is less comprehensive than that of the subsequent and final declaration in canonization, the preparatory inquiry is in all substantial particulars the same. The details of both are explained at great length and with curious minuteness by the learned Pope Benedict XIV. (Lambruschini) in a special work on the subject, which has the further interest of containing as an appendix the minutes of the entire proceedings in the canonization which took place during his own official connection with that department. The inquiry in both procedures is conducted by the congregation of cardinals, called the Congregation of Rites, and consists first in an examination of the writings (if there be any) of the individual, then of the holiness of his life and conversation, and finally of the miracles alleged to have been performed by him in life, or obtained through his relics and intercession after death. Two such miracles at least must be established by what is considered satisfactory evidence. Upon all these points sworn depositions are required, and all are subjected to a most rigorous scrutiny, in which the office of impugnant is discharged by an advocate called Promotor Fidei, and popularly nicknamed the Devil's Advocate, his duty being to raise every possible difficulty in the way of the acceptance of the evidence of sanctity. This inquiry is generally a very protracted one; and after it has been completed, and its results recorded in writing, the acts are submitted to the cardinals, who meet three times in private congregations, and finally, if all appears satisfactorily established, in a public congregation, by which the decision is made known to the pope. Should the decision be approved by the pope, the solemnization is proceeded with. The solemnity takes place in the Vatican Church.

The cardinal prefect of the congregation of rites hands the pope's brief to the cardinal, arch-priest of the Vatican, by whom it is read; the *Te Deum* is intoned; the image of the beatified individual is uncovered, to receive the veneration of the assembly; high mass, with the Collect, in his honor, is sung; and in the afternoon the pope goes solemnly to the church to pay reverence to the image. The procedure, in case of a martyr, is somewhat different. In both, however, the process is but preliminary to the solemn canonization. The effect of the latter comprises (1.) a declaration that the canonized person is to be recognized as a saint throughout the entire church; (2.) that he is to be invoked in the public prayers; (3.) that churches and altars may be erected in his honor; (4.) that he may be invoked in the mass and public service; (5.) that a festival may be celebrated in honor of him; (6.) that his image may be set up in public; and lastly, that his relics may be preserved and publicly honored. The solemnity of canonization, which is preceded by a new inquiry similar to that of the beatification, and a new judgment of the congregation of rites confirmed by the pope, is one of the most gorgeous in the entire ceremonial of the Roman Church. It takes place in the Vatican Church (St. Peter's), and is generally attended by a large assembly of bishops from various parts of the church. In many respects it resembles that of the beatification, but its distinctive characteristic is the solemn publication, by order of the pope in person, after the hymn of invocation of the Holy Ghost has been sung, of the decree of canonization. This is followed by mass, also celebrated by the pope in person, and sometimes by a homily of the pope in honor of the newly canonized. The Church of St. Peter's is specially decorated at a vast cost for the ceremonial, and the entire expenditure on such occasions has been estimated at not less than £20,000. Roman Catholics hold that in such decrees the judgment of their church is infallible; and to deny that any particular canonized individual is really a saint, is held to involve, if not actual heresy, at least a grievous act of contumacy against the faith of the church. On the doctrine of saint-worship, see INVOCATION OF SAINTS; and on that regarding the honor paid to relics of saints and martyrs, see RELICS.

SAINTS' DAYS, days set apart in honor of particular saints and martyrs. The practice dates from the times of persecution, when the people were wont to assemble at the tombs of martyrs on the anniversary of the martyrdom. In the multiplication of such celebrations, a record of the days fixed for each saint or martyr became necessary. This was called *calendarium*. The days so appointed were celebrated with more or less solemnity, according to the dignity of the saint, or the degree of devotion with which he was regarded. In some cases the saint's day was kept as a holiday of obligation, in which no servile work was permitted to be done. Other days are of various minor degrees of solemnity, and are called double (greater or lesser), semi-double, and simple, from the peculiar form of the office set apart for each. In particular countries, provinces, dioceses, or parishes, the day of the patron saint is specially celebrated; and in all churches the festival of the saint to whom the church is dedicated.

SAINT SERVAN, a seaport of France, in the dep. of Ille-et-Vilaine, stands at the mouth of the Rance, opposite St. Malo (q. v.), to which there is communication by land at low-water. The harbor, called Port Solidor, is secure. S. S., which is frequently spoken of as a suburb of St. Malo, is much frequented as a watering-place, and carries on ship-building and considerable commerce, especially in timber. Pop. (1876) 9912.

SAINT SIMON, LOUIS DE ROUVROI, DUC DE, whose family claimed to be descended from Charlemagne, was born in January 1675. After receiving a careful education under the superintendence of his mother, he entered the army in 1693, but considering his promotion not equal to his deserts, he resigned his commission in 1702, and devoted the remainder of his life to a sort of court statesmanship. S.'s position was as singular and as anomalous as his character. Profoundly ambitious, his pride was yet greater than his ambition. His ideas of aristocratic rights and privileges were perhaps more outrageously fanatical than any ever entertained in modern ages; and the whole aim of his life was to nullify the influence of the parliament, and to place the government of France in the hands of the *grands seigneurs*—the great territorial lords. The middle class he abhorred; and the rise to distinction of any one belonging to that order—any *novus homo*, tortured his patrician soul almost beyond endurance. We have not space (nor would it be worth our while, if we had) to recount his career of haughty and insolent conspiracy against the political rights of commoners, which marks him out as the most thoroughgoing oligarch in principle of whom we have any record. During the latter part of Louis XIV.'s reign, and the regency of the Duke of Orleans, he enjoyed much consideration, and his aristocratic policy more than once enjoyed a temporary triumph; but with the accession to the regency of the Duke of Bourbon he fell into disgrace, and withdrew from public life. He died at Paris, 2d March 1755. S.'s last years were occupied chiefly in the composition of his famous *Mémoires*, a brilliant work of incalculable historical value. The *Œuvres* appeared in 1791 in 13 vols.; an edition by Cheruel and Regnier (20 vols.) in 1856 *et seq.*, and completely revised, in 1873–77. Baschet's monograph *Le Duc de Saint Simon* (1874) revealed that much yet remained to be published; Boislisle undertook in 1880 a fresh issue of the *Mémoires;* and in 1881

Faugère gave us, from the French archives, the first vol. of the *Ecrits inédits de S. S.*

SAINT SIMON and SAINT SIMONIANISM. CLAUDE HENRI, COMTE DE SAINT SIMON, a French social philosopher, founder of the sect named after him, *Saint Simonians*, belonged to a different branch of the same family as the preceding, and was born at Paris, 17th October 1760. Although destined to become the propagator of the most revolutionary and democratic ideas of modern times, he was reared in a perfect hotbed of aristocratic prejudice. Nevertheless, from his earliest years, S. exhibited a decided hostility to the established system of things, mainly, however, it would seem (according to the anecdotes in vogue) from a certain purile vehemence and obstinacy of nature. He was cursed, moreover, with a precocious vanity. What are we to think of a lad scarcely 16 giving his servant orders to rouse him every morning with such a flattering summons as *Levez-vous, Monsieur le Comte vous avez de grandes choses à faire*, especially when, in point of fact, he had *nothing* to do? S. was pretty well educated in philosophy, like most of the young nobles of his time, and had D'Alembert among others for his tutor. At 18 he entered the army, served in America, and distinguished himself on the day when Lord Cornwallis surrendered at York (17th September 1781) with all his forces. Captured by the British on his return home, he was taken to Jamaica, where he remained till the peace in 1783 restored him to liberty and France. But the monotony of garrison life did not suit his restless and impatient spirit, and in 1785 he quitted the service, and traveled in Holland and Spain, busying himself with various industrial schemes, such as connecting Madrid with the sea by means of a canal, and introducing *diligences* into Andalusia—the latter of which proved successful. The great revolution found in him—noble though he was—an enthusiastic disciple, and he voted in his patrimonial canton for the abolition of titles of nobility, but did not take any part in the political events that followed. His energies were devoted to matters more profitable than patriotic—viz., the purchase of confiscated property—and it is unhappily not at all doubtful that when France was laboring in the agony of a mighty struggle after new life, S. was consumed by an ignoble passion for enriching himself. But then, as his disciples have naïvely observed, it was necessary that he should acquire a fortune in order that he might be able to devote himself satisfactorily to ideas.

It was during the revolution, and while suffering a temporary imprisonment in the Luxembourg, that visions of a new social system, based on scientific principles, and not on political conventionalities, first unfolded themselves before his ardent imagination. His ancestor Charlemagne appeared to him one night in a dream, and said: *Depuis que le monde existe aucune famille n'a joui de l'honneur de produire un héros et un philosophe de première ligne. Cet honneur était réservé à ma maison. Mon fils, tes succès comme philosophe égaleront ceux qu' j'ai obtenu comme militaire et comme politique.* S., though now 38 years of age, commenced to study 'science,' of which he was as yet quite ignorant. The plan he adopted was pleasant and ingenious. He took a house opposite the *Ecole Polytechnique*, and invited to his table the professors of mathematics, of physics, and of astronomy, from whose lips—in the intervals of their feeding, he acquired the necessary information. Then he changed his lodgings, and fixed himself near the *Ecole de Medicine*, where, pursuing the same method with the physiologists, he learned from them something of the structure of organized bodies. In 1801, he married, and threw open his *salons* to all the savans and artists of Paris; but his lavish hospitalities—prodigalities, perhaps, they ought rather to be called—soon dissipated the fortune he had amassed during the revolution. Meanwhile a notable social idea seized him. Hearing that the husband of Madame de Stael had just died, he resolved to marry the widow, whom he considered to be the only woman fit to associate with him in his great project for the regeneration of society. To be sure there was a little impediment in the way—viz., his being already married; but in France there is never any difficulty in getting a divorce; and S. was soon as good as a bachelor again. Betaking himself to Coppet, he unfolded his plan to the lady, and begged her concurrence, urging his suit (it is said) by the most impressive considerations: *Madame, vous êtes la femme la plus extraordinaire du monde; comme j'en suis l'homme le plus extraordinaire; à nous deux nous aurions, sans doute, un enfant plus extraordinaire encore.*

Madame de Stael, however, declined to further the philanthropic projects of S. in the way he wanted, and the reformer—now beginning to be in straits—published at Geneva a *Lettre d'un Habitant de Genève a ses Contemporains* (1803), in which he proposes (among other things) that there should be an annual subscription for the benefit of men of genius—mathematicians, physicians, chemists, physiologists, litterateurs, painters, and musicians—that spiritual power should be in the hands, not of the clergy, but of savans, and temporal power in the hands of the landed proprietors, while the privilege of choosing 'chiefs of humanity' should belong to everybody; finally, he asserts that religion is only a human invention. S.'s proposal (so obstinately prejudiced are men against what is right) was not adopted—was not even noticed, either by 'men of genius' or others, and in the course of a few months he was glad to accept the office of copyist at the Mont-de-Piété. Even this humble means of making a livelihood he had to resign from ill-health, and he would probably have died of starvation had he not fallen in by chance with an old revolutionary friend called Diard, who took him into his house and furnished him with means to publish one of his most important works, the *Introduction aux Travaux Scientifiques du Dix-neuvième Siècle* (Par. 1807). The death of Diard, in 1810, once more plunged S. into misery. Soon after, we find him writing to Lacépède, Cuvier, Degérando, Cambacérès, &c., in this style: '*Monsieur,' soyez mon Sauveur, je meurs de faim . . . . Depuis quinze jours, je mange du pain et je bois de l'eau; je travaille sans feu et j'ai vendu jusqu'à mes habits pour fournir aux frais des copies de mon travail.*' There is nothing ludicrous here—it is the plain unaffected agony of utter want. In 1812, his wretchedness came to a crisis; he left Paris, betook himself to Peronne, where he fell dangerously ill, but recovered through the attentions of his family, who now settled a small pension on him; he then returned to Paris.

After the Restoration, he began—in spite of his extravagant vanity—to reap the never-failing reward of enthusiasm and perseverance—a crop of disciples. Of these the most distinguished was Augustin Thierry, who assisted him in the redaction of his *Réorganisation de la Société Européenne*—a work intended to demonstrate the inutility of the Congress of Vienna, and the incapacity of all mere political congresses to establish a durable peace. He proposes the institution of a European parliament, having the right to arbitrate in cases of difference among the various nations, and adds that the first step towards the reorganization of Europe is the union of France and England. In 1817—1818, he published *L'Industrie, ou Discussions Politiques, Morales, et Philosophiques*, partly written by himself and partly by his disciples. The third volume is the work of the celebrated Auguste Comte (q. v.). By this and other literary enterprises S. had exhausted all his funds, and as he saw no prospect of getting any more, he resolved to commit suicide, and actually discharged a loaded pistol at his own head (9th March 1823), which, however, only deprived him of an eye, and not of life. The last, and by far the most remarkable work of S., is his *Nouveau Christianisme* (Par. 1825), which contains his final and matured convictions. According to him, Christianity has been diverted from its original design. Progressive by nature, and meant to be modified by the changing circumstances of times and countries, it has been stiffened into unalterable dogmas by ecclesiastical conclaves. The clergy, whose mission is to instruct, are ignorant of the thoughts and manners of modern times, and have exhibited a complete and deplorable incapacity. Protestantism is no wiser than Catholicism. It has set its face against the fine arts, and has shown a cruel and fatal indifference to the physical amelioration of the poor. But genuine Christianity embraces in its consideration all the needs of humanity. From its grand principle, 'Love one another,' it derives the proposition, that 'religion ought to direct all the social forces towards the moral and physical amelioration of the class which is at once the most numerous and the most poor.' From this premiss is deduced the idea of a social hierarchy based on capacity and labor—the new spiritual church comprising all functions and professions, sanctifying science and industry, regulating vocations, fixing salaries, dividing heritages, and taking the best measures to make the labors of each conduce to the good of all.

S. did not live to carry out his principles in detail as far as they would have logically carried him, dying on the 19th May 1825; but in the writings of Comte we find the legitimate terminus and result of his sweeping speculations. Much in the character and system of S. is unquestionably false, exaggerated, and even laughable; but the man who reckoned among his disciples names like MM. Augustin Thierry, Auguste Comte, Olinde Rodrigues, Bailly (de Blois) Léon Halévy, Duvergier, Bazard, Enfantin, Cerclet, Buchet, Carnot, Michel Chevalier, Henri Fournel, Dugied, Barrault, Charles Duveyrier, Talabot, Pierre Leroux, Jean Reynaud, Emile Péreire, Félicien David, Saint Cheron, Guéroult, Charton, Cazeaux, Dubochet, and Stéphane Money—is one whom posterity will not willingly forget.

SAINT THO'MAS, one of the Danish West Indian Islands, forms one of the group of the Virgin Islands (q. v.), and lies 38 miles east of Puerto Rico. Area, 23 sq. m.; pop. (1st October 1870) 14,007. The surface is hilly and the soil poor. Water is exceedingly scarce; the chief town of the island, Charlotte Amalie, (q. v.), being dependent for its supply upon tanks of collected rain-water. The cultivation of vegetables, grass, and a small quantity of cotton, employs the scanty rural population; but the products are small, and nothing is exported. The port, Char-

lotte Amalie or St. Thomas, is a station for steam-packets from Southampton to the West Indies, and is an important entrepôt of West Indian produce. In October 1867 a fearful hurricane took place. In January 1868 Denmark agreed to a treaty for the sale of St. T. and St. John to the United States; but as the United States legislature declined to ratify it, the treaty never took effect.

SAINT THOMAS, an island off the west coast of Africa in the Gulf of Guinea, belonging to Portugal, 260 miles south-west of Fernando Po. Area about 120 sq. miles. Of its inhabitants, 1000 are white and mulattoes, and 12,000 are blacks. Sugar was formerly grown extensively; coffee is now the chief article of export. In 1876 slavery in St. T. was abolished by the Portuguese government. The chief town is St. Thomas or Chaves, a bishop's see, with about 4000 inhabitants, who live in miserable wooden huts, and few of whom can write or even read.

SAINT VI'NCENT, one of the British islands in the West Indies, 100 miles west of Barbadoes. It is one of the Windward Group. Area, 147 sq. m.; pop. (1881) 40,548, of whom about 2500 were whites, and 7000 colored persons, the rest being blacks. The island is one of the most beautiful of the group to which it belongs. It is traversed from north to south by a chain of volcanic mountains, which rise in the volcano called the Souffriere to the height of 3000 feet. Many of the valleys are fertile, and the shores are rich and productive. About 2-5ths of the entire area, or 35,000 acres of the 84,000, are under cultivation. Much rain falls, often to the serious injury of the crops and of the roads, but the climate is nevertheless healthy. The standard of the morality, as well as of the culture of the inhabitants, is low. In 1880. the revenue amounted to £32,035, and the public expenditure to £32,-891. The value of total imports was £150,950; of exports, £158,-947, the principal article exported being sugar. In the same year, vessels having a total tonnage of 118,433 tons entered and cleared the ports, the chief of which, and the capital of the island, is Kingston q. v.).

SAINT VINCENT, Cape, in Portuguese *Cabo da Sao Vicente*, a promontory forming the south-western corner of Portugal and of Europe, off which several important naval battles have taken place. On June 16, 1693, Admiral Rooke, with 20 English men-of-war, was here attacked by a vastly superior French fleet, and defeated with the loss of 12 men-of-war, and 80 merchantmen which were sailing under his convoy; on January 16, 1780, Admiral Rodney here destroyed several Spanish ships; on February 14, 1797, the great battle of Cape St. V. between 15 British line-of-battle and 6 frigates, under Admiral Jervis (afterwards created Earl St. Vincent), and 27 Spanish line-of-battle and 12 frigates, resulted in the total defeat of the latter and capture of 6 of their largest ships (of which, however, 4 only were ultimately secured). The effect of this last victory was to frustrate the formidable Spanish-French scheme of invading England. The fourth naval fight off Cape St. V. took place between the fleet of Queen Maria of Portugal, commanded by Sir Charles Napier (q. v.) and that of Dom Miguel, in which a portion of the latter was destroyed, and the rest captured, 5th July 1833.

SAINT VI'TUS DANCE. See Chorea.

SAIS, an ancient Egyptian city, called in the hieroglyphs *Sa*, and existing at the time of the old monarchy, was situated on the right bank of the Canopic branch of the Nile, in 31° 4′ N. lat. It is at present called Sa el Hagar, or Sa of the Stone, from some modern stone buildings in the neighborhood. There are, however, no remains of temples or palaces on the site; all that remains being a wall of unburnt brick 70 feet in thickness, perhaps the periobolos of the temple. Traces of the Temenos, 720 feet long, still exist, and of the citadel, but the temples and tombs which stood within the city walls have been completely stripped; many fine statues of basalt of the 26th or Saite dynasty, from this spot, being found in the different collections of Europe. S. gave its name to a nome, and also to two Egyptian dynasties, the 24th and 26th, founded by natives of the city. The goddesses principally worshiped there were Neith or Minerva, and Ceres or Isis.

Neith was said to be the mother of the sun, and is constantly called in the hieroglyphical legends the mistress of S.; and an inscription in the temple of Neith is said to have declared of her, 'I am past, present, and future, no one has lifted my veil, the fruit I have brought forth is the sun.' At S. there was also a sepulchre of Osiris. The tombs of the kings, contrary to Egyptian and resembling the Greek custom, were within the walls. The tomb of Amasis consisted of a stone edifice with columns, and a chamber with doors. S. was important as a religious capital. Towards the decline of the monarchy, it rose to great splendor. The 26th dynasty transferred hither the capital of the kingdom. Amasis transported a monolithic shrine of granite from Elephantine to S. after three years' labor, employing 2000 men in the undertaking. Solon and Pythagoras visited S., and Plato was instructed in its colleges. There seems to have been a considerable Greek population in the city; but although S. continues to be mentioned after the 26th dynasty, its political importance then declined, and Memphis became the seat of government. The intercourse between S. and Athens subsequently gave rise to the idea of Athens having been colonized from it. Lepsius, *Briefe*, p. 12; Wilkinson, *Modern Egypt*, vol. i. p. 183; Heriodt. ii. 28, 59, 169; Strabo, xvii. p. 801; Champollion, *L'Egypte*, ii. p. 219; *Lettres*, p. 50.

S'AIVAS is the name of one of the three great divisions of Hindu sects. See India. The word designates the votaries of S'iva, and comprises different special sects, which varied in number at different periods of medieval Hinduism. To judge by the number of shrines dedicated to S'iva in his form as Linga, it would seem that the worship of this deity was the most prevalent of all the modes of adoration; but these temples are scarcely ever the resort of numerous votaries, and they are regarded with comparatively little veneration by the Hindus. In Upper India, the worship of S'iva has, indeed, never assumed a popular form. No legends are recorded of this deity of a poetic or pleasing character; the S., unlike the Vaishnavas, have no works in any of the common dialects, such as the *Râmâyan'a*, the *Vârttâ*, or the *Bhaktamâeâ;* no establishments in Hindustan, like S'rînâth or Purî; and their teachers of repute, like S'ankara (q. v.), are too philosophical and speculative to be really popular. The worship of S'iva seems, therefore, to have been, from a remote period, more that of the learned and speculative classes, than that of the masses of the people. In a renowned work called the *S'ankara-dig-vijaya*, or the victory of S'ankara over the world, composed by Anandagiri, one of the disciples of S'ankara, several subdivisions of the S. are named—viz., the *S.*, properly so called—who wore the impression of the Linga on both arms—the *Raudras*, who had a trident stamped on the forehead; the *Ugras*, who had the drum of S'iva on their arms; the *Bhâktas*, with an impression of the Linga on their foreheads; the *Jangamas*, who carried a figure of the Linga on their head; and the *Pâs'upatas*, who imprinted the same symbol on the forehead, breast, navel, and arms. The present divisions of the S., however, are the following: the Dan'd'ins and Das'nâmi-Dandins; the Yogins; the Jangamas; the Paramahansas; the Aghorins; the Urdhabâhus; Akâs'mukhins and Nakhins; the Gûdaras; the Rûkharas, Sûkharas, and Ukharas; the Kârâlingins; the Brahmachârins; and the Nâgas.

The *Dan'd'ins*, or staff-bearers, properly so called, are the representatives of the fourth order, or mendicant life, into which a Hindu is to enter after he passed through the stages of a religious student, householder, and hermit. The Dan'd'in is distinguished by carrying a *dan'd'a*, or small staff, with several projections from it, and a piece of cloth dyed with red ochre—in which the Brahmanical cord is supposed to be enshrined—attached to it. He shaves his hair and beard, wears only a cloth round his loins, and subsists upon food obtained ready-dressed from the houses of the Brahmans once a day only, which he deposits in the small clay-pot that he always carries with him. He should live alone, and near to, but not within a city; this latter rule, however, is rarely observed. The genuine Dan'd'in is not necessarily of the S'aiva sect; but those who worship S'iva, especially in his form as Bhairava, or the Terrific, have, at the ceremony of initiation, a small incision made on the inner part of the knee, the blood drawn by this process being deemed an acceptable offering to the god. The *Das'nâmi-Dan'd'ins* are included in this class; but they admit none but Brahmans into their body, and are considered to be the descendants of the original members of the fraternity, who refer their origin to the celebrated *S'ankara* or *S'ankarâ-châryа* (q. v.). He is said to have had four disciples, who are called Padmapa'da, Hastâmalaka, Sures'wara or Mandana and Trot'aka. Of these, the first had two pupils, Tîrtha and As'rama; the second two, Vana and Aran'ya; the third had three, Saraswatî, Purî, and Bhârati; and the fourth had also three, Giri or Gir, Pârvata, and Sâgara. These ten constitute collectively the Das'nâmi (from *das'an*, ten, and *na'man*, name); and when a Brahman enters either class, he attaches to his denomination that of the class of which he becomes a member; as Tîrtha, Giri, &c. The philosophical tenets of this sect are mainly those of the *Vedânta* (q. v.), as taught by S'ankara and his disciples; but they generally superadd the practice of the *Yoga* (q. v.), and many of them have adopted the doctrines of the *Tantras*(q. v.).

The *Yogins* are, properly speaking, followers of the *Yoga* (q. v.) system; and the term implies a class of men who practise the most difficult austerities, in order to become absorbed into the universal spirit, and thus liberated from repeated births. The votaries of S'iva, so called, hold that, by dint of these practices—such as continued suppressions of respirations, sitting in 84 different attitudes, fixing the eyes on the top of the nose—they will be finally united with S'iva, whom they consider as the source and essence of all creation. The principal sect of this class is that of the *Kânphât'â Yogins*, who trace their origin to a teacher named *Gorakhnâth*, who seems to have lived in the beginning of the 15th

c., and according to his followers, was an incarnation of S'iva. A temple of Gorakhnâth exists at Gorakhpur; a plain called Gorakhkhetr; is near Dwârakâ, and a cavern of his name at Haridwâr. The Yogins of Gorakhnâth are called Kânphâtâs, from having their ears bored and rings inserted in them at the time of their initiation. They may be of any caste; they live as ascetics, single or in colleges; officiate as priests of S'iva in some places; mark the forehead with a transverse line of ashes, and smear the body with the same substance; they deal in fortune-telling, profess to cure diseases with drugs and spells; and some play and sing, and exhibit animals.

The *Jangamas*, or *Lingavats*, are likewise not an important division of the S'aiva sect. Their essential characteristic is the wearing of the Linga emblem on some part of their dress or person.

The *Paramahansas* are ascetics who pretend to be solely occupied with the investigation of Brahman, and to be equally indifferent to pleasure or pain, insensible of heat or cold, and incapable of satiety or want. In proof of this, they go naked in all weathers, never indicate any natural want, and receive from their attendants what is brought to them as their alms or food.

The same apparent worldly indifference characterizes the *Aghorins;* but they seek occasions for its display, and demand alms as a reward for its exhibition. Their practices, too, seem to betray that originally their worship was not of an inoffensive kind, but required even human victims for its performance. They eat and drink whatever is given to them, even ordure and carrion; and in order to extort money from the credulous, they resort to the most disgusting devices.

The *Urdhabâhus* are solitary mendicants; they extend one or both arms above their heads till they remain of themselves thus elevated. They also close the fist, and the nails being suffered to grow, completely perforate the hand. They usually assume the S'aiva marks, and twist their hair so as to project from the forehead, in imitation of the matted hair of S'iva.

The *Akâs'mukhins* hold up their faces to the sky till the muscles of the back of the neck become contracted and retain it in that position.

The peculiarities of the other sects we cannot afford space to specify; they are equally trifling, and sometimes disgusting.—For fuller details on the Sa'ivas, see H. H. Wilson, *A Sketch of the Religious Sects of the Hindus;* Works, vol. i. (edited by Dr. R. Rost, Lond. 1862), pp. 188, ff.

S'AKA. See S'ALIVAHANA.

S'AKAT'AYANA is the name of a celebrated Hindu grammarian, who preceded Pân'ini (q. v.) and Yâska (see NIRUKTA), for he is quoted by both these authors. His grammatical work, however, seems to be lost, for no portion of it has as yet been forthcoming; and an attempt recently made to identify with it a grammar of a S'âkat'âyana, copies of which are met with at the India Office Library, London, and at Madras, has signally failed. The latter S'âkat'âyana is a Jaina (q. v.), who is not only later than Kâtyâyana (q. v.), but, in all probability, a modern writer.

SAKHALI'N, commonly written SAGHALIEN, native name TARAIKA, a long and narrow island, runs from north to south close off the shores of Asiatic Russia, in the south-west of the Sea of Ochotsk. It formerly belonged partly to Russia and partly to Japan, but the whole of the island now belongs to Russia, Japan having surrendered its portion in 1875. The estimated area is 27,600 sq. m. Pop. (1872) 13,000. It is 588 m. in length, and about 120 m. in extreme breadth. Lat. 45° 54′—54° 24′ N. In lat. 52° the island approaches to within six miles of the mainland, from which it is separated by the shallow Mamia Strait. A mountain-chain with craggy summits, which in lat. 52° are covered with snow throughout the year, traverses the island from north to south. There are no important natural harbors. The chief rivers are the Ty, falling into Patience Gulf, and 90 feet wide and 7 feet deep at its mouth, and the Tymy flowing north-east. The rivers and the coasts swarm with fine fish. Immense stores of fish are preserved in a frozen state during winter, and upon these the natives and their dogs in great part subsist. On the east coast of the island the vegetation, especially in the north, has a stunted appearance. On the west coast luxuriant grass clothes the valleys, and forests of pine, fir, birch, larch, oak, and maple trees cover the mountains. Among the animals are the reindeer, the stag, roe, elk, and musk ox. In the northern part of S. the climate is even more rigorous than at Nikolaevsk (q. v.). At Aniva Bay in the south, the coldest day in the winter of 1853—1854 showed a temperature of — 13° F. The inhabitants carry on an inconsiderable barter trade with their fish, furs, and seals. Coals have been discovered in several localities and explored by the Russians. Ravenstein's *Russians on the Amur* (Trübner & Co., Lond. 1861).

SAKHALIN ULA HOTUN, now commonly and more properly called Aigun, a town of Manchuria, on the right bank of the Amur, 14 miles below the junction of the Dzeya with that river. Lat. 50° 15′ N., long. 127° 40′ E. It is the chief place of the Manchu on the Amur, and is sombre in appearance, though it contains many gaily painted temples. The great quadrangle, containing the government and other buildings, is 230 yards square, and is surrounded by double rows of palisades. Paper lanterns hang across the streets, and fantastic figures—dragons, &c.—cut in paper, are fixed to poles aboves the shops. Millet, tobacco, and other products, are grown in the vicinity for export. Pop. 15,000.

SAKI, a kind of beer which the Japanese make from rice. It is the common alcoholic liquor of Japan. It is clear, and has a peculiar taste, which Europeans generally reckon unpleasant. The Japanese usually heat it before drinking, and pour it into flat cups or saucers of lacquered wood. It produces a very speedy and transient intoxication.

SAKI (*Pithecia*), a genus of American monkeys having the tail, which is not prehensile, covered with very long hair, whence they are often called *Fox-tailed Monkeys*. The head is round, and the muzzle short, the ears not unlike those of the human race. The whole body is covered with long hair.

S'AKTAS, is the name of one of the great divisions of Hindu sects (see INDIA). The term is derived from the Sanscrit *s'akti*, which means 'power, energy;' but, in its special application, denotes the energy of the deity, and particularly that of the gods of the Hindu triad, Brahma, Vishn'u, and S'iva. This energy, originally spoken of as the wish or will of the Supreme Being to create the universe, and afterwards dilated upon it in metaphorical and poetical speech, assumed at the Pauranik period (see *Hindu Religion* under INDIA) the form of a separate deity, thought of as the wife of the god to whom it belongs. Accordingly, Saraswatî (q. v.) became the S'akti or wife of Brahman; Lakshmî (q. v.), the S'akti or wife of Vishn'u; and Devî, or Durgâ, or Umâ (q. v.), the S'akti or wife of S'iva. *S'âkta*, properly speaking, means, therefore, a worshiper of any of these female representations of the divine power; but, in its special and usual sense, it is applied to the worshiper of the female energy or wife of S'iva alone; and the S., properly so-called, are, therefore, the votaries of Durgâ, or Devî, or Umâ (q. v.). Since S'iva (q. v.) is the type of destruction, his energy or wife becomes still more so the type of all that is terrific; and, in consequence, her worship is based on the assumption that she can be propitiated only by practices which involve the destruction of life, and in which she herself delights. That such a worship must lead to the brutalization, and degenerate into the grossest licentiousness, of those addicted to it, is but natural; and it will easily be understood that the S'âkta religion became the worst of all forms which the various aberrations of the Hindu mind assumed. Appealing to the superstitions of the vulgar mind, it has its professors, chiefly amongst the lowest classes; and, amongst these again, it prevails especially in Bengal, where it is cultivated with practices even scarcely known in most other provinces. The works from which the tenets and rites of this religion are derived, are known by the collective term of *Tantras* (q. v.), but as in some of these works the ritual enjoined does not comprehend all the impure practices which are recommended in others, the sect became divided into two leading branches, the *Dakshin' âchârins* and *Vâmâchârins*, or the followers of the right-hand and left-hand ritual.

The *Dakshin' âchârins* are the more respectable of the two. They profess, indeed, to possess a ritual as pure as that of the Vedas. Nevertheless, they annually decapitate a number of helpless animals, especially kids, and in some cases pommel the animal to death with their fists, or offer blood without destroying life—practices contrary to the Vedic ritual. The *Vâmâchârins*, on the other hand—the type of the S.—and amongst these especially that branch called Kaula or Kulîna, adopt a ritual of the grossest impurities. Their object is, by reverencing Devî, who is one with S'iva, to obtain supernatural powers in this life, and to be identified after death with S'iva and his consort. 'According to the immediate object of the worshiper,' Professor Wilson says, 'is the particular form of worship; but all the forms require the use of some or all of the five letters M—viz., Mânsa, Matsya, Madya, Maithuna, and Mudrâ—i. e., flesh, fish, wine, women, and certain mystical gesticulations. Suitable *mantras* (or formulas) are also indispensable, according to the end proposed, consisting of various unmeaning monosyllabic combinations of letters, of great imaginary efficacy. Where the object of the ceremony is to acquire an interview with, and control over, impure spirits, a dead body is necessary. The adept is also to be alone, at midnight, in a cemetery or place where bodies are burned or buried, or criminals executed; seated on the corpse, he is to perform the usual offerings, and if he does so without fear, the Bhûtas, the Yoginîs, and other male or female goblins, become his slaves. In this, and many of the observances practised, solitude is enjoined; but all the principal ceremonies comprehend the worship of S'akti, and require for that purpose the presence of a female as the living representative and type of the goddess. This worship is mostly celebrated in a

mixed society, the men of which represent Bhairava (or S'iva as the Terrific), and the women, Bhairavî (S'akti or Devî as the Terrific). The S'akti is personated by a naked female, to whom meat and wine are offered, and then distributed amongst the assistants; the recitation of various Mantras and texts, and the performance of the Mudrâ, or gesticulations with the fingers, accompanying the different stages of the ceremony; and it is terminated with the most scandalous orgies amongst the votaries.'

The same author adds that, 'in justice to the doctrines of the sect, it is to be observed, that these practices, if instituted merely for sensual gratification, are held to be as illicit and reprehensible as in any other branch of the Hindu faith;' but full assent must be given to his remark which follows a text quoted by him in support of this view, for he says: 'It is only to be added that if the promulgators of these doctrines were sincere, which is far from impossible, they must have been filled with a strange frenzy, and have been strangely ignorant of human nature.'

'The members of this sect are very numerous, especially amongst the Brahmanical caste; all classes are, however, admissible, and equal at the ceremonies of the sect. The particular insignia of these S'aktas, are a semicircular line or lines on the forehead, of red sanders or vermilion, or a red streak up the middle of the forehead, with a circular spot of red at the root of the nose. They use a rosary made of the seeds of the eleocarpus, or of coral beads, but of no greater length than may be concealed in the hand; or they keep it in a small purse, or a bag of red cloth. In worshiping, they wear a piece of red stlk round the loins, and decorate themselves with garlands of crimson flowers.' Two other sects are likewise mentioned as belonging to the S., the *Kânchuliyas* and *Karârins*, but it is doubtful whether they are still in existence. The former are said to have belonged to the south of India; and the latter seem to have been worshipers of Devî in her terrific forms, the offering to her of human sacrifices being the principal feature of their ritual. If there are still any votaries of this sect, Professor Wilson believes that they are the miscreants who, more for pay than devotion, at certain festivals, inflict upon themselves bodily tortures, such as piercing their flesh with hooks or spits, reclining upon beds of spikes, gashing themselves with knives, &c.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus;* Works, vol. i. (edited by Dr. R. Rost, 1862), pp. 240, ff.

S'AKUNTALA is one of the most pleasing female characters of Hindu mythology. She is mentioned as a water-nymph in the *Yajurveda* (see VEDA); she is the subject of a beautiful episode of the *Mahâbhârata* (q. v.), and is spoken of in the *Purân'as;* but her name has become especially familiar in Europe through the celebrated drama of Kâlidâsa (q. v.), which, introduced to us by Sir William Jones in 1789, became the starting-point of Sanscrit philology in Europe. The principal features of the legend of S., as narrated in the *Mahâbhârata*, are the following: S. was the daughter of the saint Vis'wa'mitra (q. v.) and the Apsaras, or water-nymph, Menakâ. Abandoned by her parents, she was adopted by the saint Kan'wa, who brought her up in his hermitage as his daughter. Once upon a time, King Dushyanta went a-hunting in the forest, and accidentally coming to the hermitage of Kan'wa, saw S,, and fell in love with her. He persuaded her to marry him according to the rite of the Gandharva marriage, and promised her that the son she would bear him should be the heir to his throne, and that he would take her home as his queen to his royal city. Kan'wa, who had been absent while this event happened, returned to the hermitage, and through his divine knowledge, knew the whole secret, though it had not been confessed to him by S'akuntalâ. She in due time was delivered of a son, and remained at the hermitage until the boy was six years old; but as Dushyanta, unmindful of his promise, did not send any messenger for her, Kan'wa directed her to proceed with her boy to the residence of Dushyanta. This she did; but when she arrived at his residence, she was repudiated by the king. Nor did her speech, however touching and eloquent, move his heart, until at last a heavenly voice assured him that S. had spoken the truth, and that he saw before him his lawful son. Thereupon, Dushyanta recognized S. as his queen, and her son as his heir. The latter was named Bharata, and became the founder of the glorious race of the Bhâratas.

In the drama, Kâlidâsa's genius had full scope to work out the incidents of this legend, so as to display the accomplished female character of S., and likewise to show that the obstacle which arose to her recognition was not the fault of Dushyanta, but the consequence of a curse which S. had incurred from a wrathful saint who, when once on a visit to Kan'wa's hermitage, had considered himself neglected by her. Since, in the drama, Dushyanta recognizes S. by means of a ring he had given her at the hermitage, the name of the drama is *Abhijnâna-S'akuntala*, or 'the drama in which S'akuntalâ (is remembered) by a token.' There are two versions in which this drama now exists—an older and a more recent one. The latter was first edited at Calcutta, 1761, then at Paris, 1830, by A. L. Chézy, who also gave a French translation of it; later and better editions of it (Cal. 1860 and 1864) were prepared by the Pandit Prem Chunder Tarkabâgish, under the superintendence of Professor Edward B. Cowell, the Principal of the Sanscrit College at Calcutta. The older version has been edited by Dr. O. Boehtlingk (Bonn, 1842), by Professor M. Williams (Hertford, 1853), and by a Bombay Pandit at the Induprakâs'a press (Bomb. 1861). The first English translation of it is that by Sir William Jones (Cal. 1789); the second was made by Professor M. Williams (Hertford. 1856); it deserves the highest acknowledgment, on account of the consummate taste with which it has rendered the metrical part of the original. Among the various German, Italian, Danish, and other translations of this drama, the German translation by Ernst Meyer (Stutt, 1852) is worthy of especial notice.

S'AKYAMUNI, or the SAINT S'AKYA, is a name of *the* Buddha, the founder of the Buddhist religion. See BUDDHISM.

SAL (*Vateria robusta*), a tree of the natural order *Dipteraceæ*, one of the most valuable timber trees of India. Great sal forests exist along the southern base of the Himalaya Mountains, but in many places they have been nearly cut down. The care of government is now extended to their preservation.

SALAA'M (*Selám*, Arab. = Heb. *Shalom*, peace), the general term of salutation among the Mohammedans. They are generally very formal in their social manners, although their demeanor and conversation are unrestrained enough, both among men and women. Several of their social usages in this respect are founded upon religious precepts; among these is the custom of greeting each other with the words: 'Es-selámu aleikum' (Peace be with you), which is answered by: 'With you be peace and the mercy of God, and His blessings!' This salutation is neither to be addressed to nor to be received from any non-Mohammedan. The reply, when one Moslem salutes another, is obligatory, while the address itself is rather arbitrary. Should the saluted refuse to reply, then the other may revoke his salutation, as he does in the case of his discovery that the person saluted is not a true believer, with the words: 'Peace be on us and on all the righteous worshipers of God.' Generally, the rider salutes the person on foot, the passer-by those who sit down or stand still; the smaller party salutes the larger, the young the older, &c. Salutation is to be the first and the last thing on entering a house. The following is the rising scale of the different modes of obeisance with the Moslem: 1. Placing the right hand upon the breast; 2. Touching the lips and the forehead or turban (or forehead and turban only) with the right hand; 3. Doing the same, but slightly inclining the head during that action; 4. The same, but inclining the body also; 5. The same, previously touching the ground with the right hand; 6. Kissing the hand of the person to whom the obeisance is paid; 7. Kissing his sleeve; 8. Kissing the skirt of his clothing; 9. Kissing his feet; 10. Kissing the ground. This, however, is to be understood (against De Sacy) as merely touching the ground previous to touching the lips and forehead with the right hand. The first five modes are accompanied by the 'Peace be with you,' and the reply given above. The sixth mode is observed by servants or pupils to their master, wife to husband, and children to father, and sometimes mother, by the young to the aged, and the less learned to the learned and pious (Lane, *Notes to Arab. Nights*, &c.).

SA'LAD, the name given to a preparation of raw herbs for food. It derives its name from the fact that salt is one of the chief ingredients used in dressing a salad. The principal salad herbs are lettuce, endive, chicory, celery, mustard, and cress; water-cress, onions, radishes, chervil, and a few savory herbs used to give flavor. They are usually cut up, and mixed with salt, vinegar, oil, and other condiments, according to taste. Sugar is also frequently added. Cresses, seed-leaves of mustard, &c., are often eaten without any addition. Salad has always been a favorite food with civilized nations, and has very little varied in its composition. The Romans used it, and made it thus: Cultivated endive was cut small after careful washing and draining, then gravy and oil were poured over it; and finely-minced onions were strewed over the whole; then a little vinegar and honey was added, and the salad served up. The great value of salads is in the fact that they are uncooked, and consequently contain a larger quantity of mineral matter, such as potash, soda, &c., than if boiled. Salads are sometimes prepared with animal food, such as boiled lobsters, crabs, eggs, &c.

SALADIN, the name given by western writers to SALAH-ED-DIN YUSSUF IBN AYUB, the sultan of Egypt and Syria, and the founder of the Ayubite dynasty in those countries. As the great Moslem hero of the third crusade, and the beau-idéal of Moslem chivalry, he is one of the most interesting characters presented to us by the history of that period. He belonged to the Kurdish tribe of Ravad, and was born at Tekreit (a town on the Tigris, of which his father Ayub was *kutwal* or governor under the Seljuks)

in 1137. Following the example of his father and uncle, he entered the service of Noureddin (q v.), prince of Syria, and accompanied his uncle in his various expeditions to Egypt in command of Noureddin's army. S. was at this time much addicted to wine and gambling, and it was not till, at the head of a small detachment of the Syrian army, he was beleaguered in Alexandria by the combined Christians of Palestine and Egyptians, that he gave indications of possessing the qualities requisite for a great captain.

On the death of his uncle, Shîrkoh, S. became grand-vizier of the Fatimite calif, and received the title of *El-melek-el-nasr*, 'the Victorious Prince;' but the Christians of Syria and Palestine, alarmed at the elevation of a Syrian emir to supreme power in Egypt, made a combined and vigorous attack on the new vizier. S. foiled them at Damietta, and transferred the contest to Palestine, taking several fortresses, and defeating his assailants near Gaza; but about the same time his new-born power was exposed to a still more formidable danger from his master, Noureddin, whose jealousy of the talents and ambition of his able young lieutenant, required all the skill and wariness at S.'s command to allay. On Noureddin's death, in 1174, S. began a struggle with his successor, which ended in his establishing himself as the Sultan of Egypt and Syria, a title which was confirmed to him by the calif of Bagdad. The next ten years were occupied in petty wars with the Christians, and in the arrangement and consolidation of his now extensive dominion. The plundering by the Christians of a rich pilgrim caravan on its way to Mecca, an infringement of the treaty with S., brought down upon them the latter's vengeance; their army suffered a dreadful defeat at Tiberias (4th July 1187); the king of Jerusalem, the two grand-masters, and many other warriors of high rank were taken captive; Jerusalem was stormed (2d October), and almost every other fortified place in Palestine was taken. The news of this great success of the infidels being brought to Western Europe, aroused the enthusiasm of the Christians to its highest pitch, and a powerful army of crusaders, headed by the kings of France and England, speedily made their appearance on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion, at the head of that portion of the crusading army which adhered to him, continued the war with success, twice defeated S., took Cæsarea and Jaffa, and finally obtained a treaty for three years (August 1192), by which the coast from Jaffa to Tyre was yielded to the Christains. In the following year, S. died at Damascus of a disease under which he had long suffered.

S. was not a mere soldier; his wise administration left behind it traces which endured for centuries; and the citadel of Cairo and sundry canals, dikes, and roads are existing evidences of his careful attention to the wants of his subjects. In him the warrior instinct of the Kurd was united to a high intelligence; and even his opponents frankly attribute to him the noblest qualities of medieval chivalry, invincible courage, inviolable fidelity to treaties, greatness of soul, piety, justice and moderation.

The Ayubite dynasty of which he was the founder ruled over Syria till 1259, when it was dispossessed by the Perso-Mongols, and over Egypt till the rise of the first Mameluke kingdom under Ibeg in 1250.

SALAMA'NCA, one of the three modern provinces of Spain, into which the ancient kingdom of Leon (q. v.) was divided. Area about 4940 sq. m.; pop. (1877) 285,509.

SALAMANCA, a famous town of Spain, capital of the modern province of the same name, stands on three rocky hills on the right bank of the Tormes, 50 miles east-north-east of Ciudad Rodrigo. Prior to its almost total destruction by the French in 1812, it was renowned for the number of its splendid edifices and institutions, and even yet it is a rich mine for the architect, abounding as it does in magnificent specimens of simple and florid Gothic, as well as of the richest cinque-cento. It is surrounded by a wall, pierced with nine gates, and a part of which is very old. The narrow, crooked, dark, and steep streets, containing many old and stately structures, the residences of the old nobility, give to the town an antique and venerable look. Besides the old cathedral, a simple and massive edifice, it contains five other churches of the 12th century. The new cathedral, begun in 1513, is a magnificent structure in florid Gothic, in the adornment of which painting, gilding, and sculpture have been largely and most successfully used. At the close of the 18th c., S. contained 27 parish churches, 39 convents, and 25 colleges. Of the colleges, 20 were destroyed by the French while the town was in their possession, as well as about 20 of the convents, for the purpose of obtaining materials for the erection of fortifications, and for firewood.

The university of S., with which the university of Palencia (q. v.) was incorporated in 1243, was founded in 1200. It consisted of a number of colleges, divided into *Mayores* and *Menores*, or larger and smaller colleges. Of the former, there were only six in Spain, and four of these were at S.: the other colleges were 21 in number. In the 14th c., the university was attended by 17,000 students; the attendance is now only 200. The library, according to the most recent statements, contains 30,000 volumes and 1500 MSS. The school of S. is interesting to British subjects as having, from an early period, included a college for Irish students, which supplied many of the ecclesiastics who continued to minister to their countrymen during the penal times, and which is still in existence. One of the most highly-prized works in Roman Catholic divinity is the great collection of Controversial and Moral Theology, by the members of the college of Carmelite friars in S., who are known by the name of *Salmanticenses*, or the *Salamanca Theologians*. The *Plaza Mayor* is the largest square in Spain, and when fitted up as a bull arena, as it was so recently as 1863, it accommodates from 16,000 to 20,000 persons. The bridge across the Tormes rests on 27 arches, and is of Roman foundation. Manufactures of cloth, leather, and earthenware are carried on. Pop. (1878) 18,007.

S., the ancient *Salmantica*, was a Roman *municipium*. In the vicinity was won one of the most famous victories of the Peninsular War, by the British under Wellington against the French under Marmont, 22d July 1812.

SALAMA'NDER, in the superstitions of the middle ages, denoted a being possessing the shape of a man, whose element was the fire, or who at least could live in that element. Paracelsus placed salamanders among the elementary spirits.

SALAMANDER (*Salamandra*), a genus of Batrachians of the family *Salamandridæ*, to which Newts (q. v.) also belong. The name is, indeed, sometimes extended to the whole family; newts being called *Aquatic Salamanders*, and the name *Terrestrial S.* being given to this genus, the species of which inhabit water only in their tadpole state, and return to it only to deposit their eggs, generally living in moist places, as under stones, roots of trees, &c. The general form is very similar to that of newts, but the tail is round, not flat as in newts. Several species are found in Europe; none of them, however, in Britain. The SPOTTED S. (*S. maculosa*), six or eight inches long, black, with bright yellow stripes on its sides, and livid blue beneath, is widely spread

Spotted Salamander (*S. maculosa*).

throughout Europe. The BLACK S. (*S. atra*) is much smaller, black, the body and tail ringed, the tail almost as if formed of beads. It is abundant in the Alps and mountains of Southern Germany. Other species are found in Spain, Italy, &c.; Asia and North America also produce numerous species. Salamanders feed on worms, slugs, snails, and insects. They are inert and sluggish creatures, and timid to the utmost extent that their stupidity permits. The brain is very small. They are perfectly harmless, although exuding, when alarmed, from pores on the back and sides, a milky humor, which is injurious to very small animals. But they have long had, and still retain, a popular reputation of extreme venomousness, and are therefore objects of the utmost dread to the vulgar in almost all countries which they inhabit. Strange fables have been current concerning them from remote ages, particularly concerning the icy cold which envelops their body, and enables them not only to endure fire without burning, but to extinguish fire. Pliny, indeed, records that he tried the experiment, and the poor S. was burned to powder; yet the fable continued to be credited until very recent times.

SA'LAMIS (modern name, *Koluri*), in ancient times called also *Pityoussa* (Island of Pines), an irregularly-shaped, mountainous island of Greece, off the coast of Attica, and forming with it the Bay of Eleusis. Its area is about 30 sq. m., and it has a modern population of about 4000, the chief town being Koluri, on the west coast. It had anciently two principal towns, Old and New Salamis, the former on the south, and the latter on the north-east coast. S. is remembered chiefly on account of the great naval battle between the Greeks and Persians, which was fought (480 B.C.) a few days after the battle of Thermopylæ, in the narrow strait between the east coast of S. and the west coast of Attica. The Grecian fleet, consisting of about 360 vessels, was drawn up at the entrance of the bay forming the harbor of New Salamis, Themistocles being leader of the Athenian contingent, and Adimantus of the Corinthian, while the whole was under the command of the Spartan Eurybiades. Great dissensions prevailed among the Grecian leaders, which would probably have

led to a general break-up, had not Themistocles by a stratagem induced Xerxes, king of the Persians, to bring up his fleet, and give immediate battle to the Greeks. Xerxes drew up his ships, numbering at least 1000, during the night previous to the battle, opposite the Grecian fleet, along the coast of Attica, almost completely blocking up both entrances to the straits; and confident of victory if he himself superintended operations, he took his seat on a throne erected on a lofty height on the Attic coast, almost opposite New Salamis. Both Greeks and Persians fought with great bravery, but the latter were entirely defeated, owing, perhaps, chiefly to their immense, unwieldy fleet being compressed into so small a space, which rendered it almost unworkable, and completely at the mercy of their opponents. The only name mentioned on the Persian side with distinction is that of Artemisia, queen of Halicarnassus, who is said to have fought with desperate bravery. The loss of the Greeks is said to have been 40, and that of the Persians 200 ships, exclusive of those which were captured.

SAL AMMO'NIAC (known in Chemistry as HYDROCHLORATE OF AMMONIA) is an article of considerable importance in the Materia Medica. It is obtained on a large scale by decomposing with common salt (chloride of sodium) the sulphate of ammonia, which is formed in the manufacture of coal gas, or the carbonate of ammonia, obtained by the distillation of bones. It is sold in large, crystalline, grayish-white, semi-transparent cakes, convex on one side, and concave on the other. It is inodorous, but possesses an acrid, bitter, and nauseous taste. Its specific gravity is 1·45; it volatilizes without decomposition when heated, and is freely soluble in water. Its aqueous solution, when heated with caustic potash, evolves gaseous ammonia; and when treated with nitrate of silver, yields a white, curdy precipitate of chloride of silver. This salt is largely given in France and Germany in cases of pneumonia, and of inflammation of the serous membranes, in mucous diarrhœa, in chronic rheumatism and gout, and in passive dropsies. Neligan recommends it in cases of low fever, in subacute laryngitis, in chronic affections of the liver, and in facial neuralgia. It may be given in doses varying from 10 to 30 grains, dissolved in some aromatic water. As a local external application, it is of great value in promoting the absorption of effused blood; and there is probably no remedy so effectual for that common but disfiguring affection popularly known as a *black eye*, as a moderately strong solution of this salt, kept constantly applied as a lotion. If it is desired to apply cold to any part of the body, an excellent Refrigerant (q. v.) may be obtained by dissolving five parts of this salt and five parts of nitre in sixteen parts of water.

S. A. is employed for various purposes in the arts. It is used in soldering, and in the tinning of copper and iron to prevent the oxidation of the surface to be tinned. It is exported from Britain to Russia, where it is used by dyers.

It occurs as a mineral, as an efflorescence on the surface of rocks, or as a sublimate in fissures, crystallized in small crystals, or forming crusts, stalactites, &c. It is found in volcanic regions, but is produced during the time of the quiescence of active volcanoes, rather than during their eruptions. It occurs in Britain, near burning beds of coal. It is found in Persia, Tartary, Siberia, and many other countries, where there are no active volcanoes. Formerly, all Europe was supplied with it from the neighborhood of the temple of Jupiter Ammon in Egypt whence its name.

SALDA'NHA BAY. See CAPE OF GOOD HOPE.

SALE, GEORGE, an eminent oriental scholar, was born towards the end of the 17th c., and died at London in 1736 under forty years of age. Almost nothing is known of his private life. He is supposed to have been born in Kent, and he received his education at the King's College, Canterbury. Brought up to the law, he is believed to have practised it almost to the end of his life. That he spent five-and-twenty years in Arabia, as Voltaire and many after him asserted, is a complete fiction. He assisted in getting up the *Universal History*—together with Swinton, Shelvocke, Campbell, George Psalmanazar, and A. Bower, each remarkable enough in his way—for which he wrote the cosmogony and several portions of oriental history. He was also one of the authors of the *General Dictionary;* but he is best known by his unrivalled translation of the Koran, 'with explanatory notes taken from the most approved commentators, to which is prefixed a preliminary discourse' (1734). This 'preliminary discourse,' which is of great value, and proves S. to have been deeply versed in oriental literature, treats, among other things, 'of the Arabs before Mohammed, or, as they express it, in the "time of ignorance"—their history, religion, learning, and customs; of the state of Christianity, particularly of the Eastern churches, and of Judaism, at the time of Mohammed's appearance; and of the methods taken by him for establishing his religion, and the circumstances which concurred thereto; of the doctrines, precepts, and peculiarities of the Koran, and of the principal Mohammedan sects.'

S.'s work was translated into French by Duryer (Antw. 2 vols. 1770). This translation formed a new epoch in the study of Islam and its literature; and though many other translations have been attempted since, in nearly all European and oriental languages, it still bears the palm. See KORAN. That his contemporaries fastened the charge of heresy upon one who spoke philosophically and humanely of other creeds, is not to be wondered at. After his death, a catalogue of his oriental MSS. was published, and the contents are now in the Radcliffe Library, Oxford.

SA'LEM, a town in the south of India, capital of the collectorate of the same name. The collectorate is the chief seat of the Indian *steel manufacture*—a branch of industry as curious as it is ancient. The town stands in an elevated valley, 1070 feet above sea-level, bounded on the north and south with hills, 193 miles south-west of Madras. It is well built. Cotton and silk are grown in the highly cultivated country around. Pop. 50,000.

SALEM, capital of Oregon, U. S., stands on the Willamette River, and on the Oregon and California railway, 50 miles south of Portland. Settled in 1834, and incorporated in 1853, it became state capital in 1860. Pop. (1870) 1139; (1880) 5000.

SALEM, a city and port of entry of Massachusetts, U. S., 14 miles north-east of Boston, on a peninsula 2 miles long by ⅘ths of a mile broad, with irregular but well-built streets, and a fine harbor, from which was formerly carried on a large trade with China, the East Indies, and Eastern Africa. The principal institutions of S. are: the East India Marine Society, whose extensive and unique museum of oriental curiosities is now united with that of the Peabody Academy of Science; the Essex Institute, with a library of 18,000 vols., and a picture-gallery; and the Salem Athenæum with a library of 13,000 vols. There is a normal and high school, 5 newspapers, 7 banks, 20 churches, a cotton-mill, with 65,000 spindles, and manufactures of chemicals, varnishes, leather, shoes, machinery, &c. S. was settled in 1626, and is the oldest town, except Plymouth, in New England. The first church was organized in 1629. In 1692, a great witch-mania broke out, and 19 persons were hanged for 'witchcraft.' In the war of the revolution, S. sent out 153 privateers, which took 455 prizes. Pop. in 1860, 22,-252; in 1870, 24,117; in 1880, 27,598.

SALE'MI, a town of Sicily, in the province of Trapani, 39 miles south-west from Palermo. Pop. about 12,000.

SALE OF GOODS is a contract by which the seller, in consideration of a price, transfers the property in the goods to the purchaser. Where the consideration is not money but goods, the contract is called exchange or barter. The law on the subject is not the same in England and Scotland. In England, when the bargain is struck, and the sale relates to specific goods—that is, goods already made, and existing, and identified—the property vests at once in the purchaser, so that in the event of any damage or destruction happening to the goods, the loss is that of the purchaser and not of the seller, even though the goods have not been delivered, and whether the price has been paid or not. The contract may be made either by word of mouth or by writing; but when the price exceeds £10, the statute of Frauds enacts that the contract shall not be binding unless it is in writing. If, however, the buyer shall have accepted part of the goods sold, and actually received the same, or if he shall have given something in earnest to bind the bargain, or in part payment, then a verbal contract will be binding though the price exceeds £10. Many nice questions have occurred and constantly recur as to what amounts to an acceptance and delivery of the goods, so much so, that the general policy of restricting the proof of the contract to writing in any case has been much complained of in late years; and efforts have been made, but as yet in vain, to repeal the statute of Frauds, which, it is said, encourages rather than discourages fraud. When a contract of sale is made, the duty of the seller is to deliver the goods as soon as the buyer has performed all the conditions agreed upon. If no time was specified for delivery, then he must deliver the goods in a reasonable time. In general, if nothing is agreed to the contrary, the seller need not deliver till the price is paid; but he must do so if the bargain was, that delivery was to take place before payment, in other words, if the sale was on credit. On the other hand, it is the duty of the buyer to accept the goods and pay for them. If either party fail at any stage in his performance of the duties arising out of the contract, the other may bring an action which varies according to the nature of the breach of contract.

One valuable right of the seller, when he has sent his goods to the buyer, and they are not delivered, is to stop them *in transitu*. Stoppage *in Transitu* (q. v.) is chiefly resorted to when the seller hears of the bankruptcy of the buyer after he has sent him goods. The law regulating the S. of G. by Agents (q. v.) or documentary titles is contained in the Factory Acts, 1823–25–42–77. See FACTOR. The chief difference between the laws of England and Scotland is that in Scotland no writing in necessary to make the contract binding, whatever the price; and that property in the

goods does not pass until they are actually or constructively delivered. See Paterson's *Compendium*, 2d ed. ss. 520—544.

SALE OF LAND differs from sale of goods in several respects. An agreement for the sale of land must be in writing, otherwise it cannot be enforced. When once a contract for the sale of land has been entered into, a Court of Equity will, contrary to the general rule which prevails when a contract is broken, enforce specific performance of the contract; that is, will compel the seller or buyer to carry out his contract, and transfer or accept conveyance of the land. When a sale of land is agreed upon, and nothing is said as to the matter, it is understood, as part of the contract, that the vendor shall be able to make a good title; and a doubtful title cannot be forced on the vendee even though it is accompanied with an indemnity. The rule is, that the abstract of title—i. e., a short account of the series of former transactions relating to the possession and property—must go back for sixty years. The expense of making searches into registers during that period falls on the purchaser. It is the duty of the purchaser's solicitor to prepare the draft of the conveyance, and tender it for approval to the vendor's solicitor; and unless there is an agreement to the contrary, the purchaser pays the expense of the conveyance. When the vendor has delivered possession of the estate to the purchaser without receiving the purchase-money, he still retains a lien on the estate for the unpaid price.

In England there is no general register which contains copies of all the deeds relating to land, so that everything depends on the preliminary inquiries between the two parties, and the certainty that the purchaser has obtained all the material information that exists. The consequence is, that the sixty years' title or previous history of the estate involves the parties in great expense. This expense requires to be renewed on every fresh sale, for a solicitor who neglects to go through the same train of inquiries as his predecessor at the time of the last preceding sale would be personally liable for any loss that occurred thereby. The great expense attending the conveyance of land has of late years been loudly complained of, and the manufacturing interest, familiar with the rapidity of similar transactions relating to goods, have demanded a simplification of the process. In order to meet this demand, which has been largely shared by the public in general, two acts of parliament were passed in 1862, for the purpose of founding a Land Registry, and enabling an owner of land to have his title examined and registered once for all, so that in the event of future transactions he may be saved the expense and delay required under the old system. These acts of parliament were not compulsory, and little progress was made, but the legislature has been maturing a scheme for making them compulsory in all but trifling sales of land. In Scotland, the law relating to the sale of land has always been on a more satisfactory footing, for there are registers in which an intending purchaser can with certainty find all the deeds, and nearly every burden that can attach to the land he wishes to buy; so that he can almost at a glance ascertain what are the dangers and drawbacks attending the transaction. See REGISTRATION OF DEEDS AND WRITS. In Scotland the expense of the conveyance of land falls on the vendor, if there is no agreement to the contrary, and the vendor's solicitor prepares and tenders the draft conveyance, while the purchaser pays his own solicitor for perusing and approving the draft conveyance; but in practice the expenses of conveyance are usually equally divided between vendor and purchaser.

SA'LEP, the tubers of many species of *Orchis* and other *Orchideæ*, dried and used as an article of food. Of the two tubers usually found at the roots of these plants, only one is gathered for salep, the younger and more solid of the two. The tubers are gathered when the stalk is about to fall. They vary from the size of a cherry-stone to that of an olive. They are cleaned, dipped for a few minutes in boiling water, and dried as quickly as possible, by which process they are rendered hard and horny. The greater part of the salep of commerce is brought from the East, and much of it from Persia; it is supposed to be obtained from species of *Eulophia;* but most of the European species of *Orchis* are used for it.

Before coffee became so common in Britain, salep was an article of considerable importance, and large quantities were imported from Turkey, Persia, and India. In France it is still in considerable request. For use it is ground into a fine powder, and mixed with boiling water, sugar and milk being added according to taste. As a diet drink, it was considered very nutritious and wholesome, and forty years ago it was sold, ready prepared, to the working-classes of London, early in the morning, from numerous street stalls. Its principal constituents are *bassorine*, starch, and phosphate of lime.

SALE'RNO (ancient *Salernum*), a city of Southern Italy, chief town of the province of S., on the gulf of the same name, 32 miles E.S.E. of Naples, with a population (1881) of 31,245. A Gothic wall, built of huge stones without mortar, encircles it; the streets are paved with lava, and, with the exception of the two principal ones, are narrow, irregular, and dirty. It has a strong castle, and a very small harbor. The old and beautiful Gothic cathedral was erected by the Normans, and has around it a portico of porphyry and granite pillars brought from Pæstum by Robert Guiscard. It has many famous sepulchres, among others, those of Robert and Guillaume Guiscard, of Margaret of Anjou, and of Gregory VII. It was celebrated in the middle ages for its school of medicine (the *Schola Salernitana*), founded by Robert Guiscard about the end of the 11th c., and which was long the first medical school in Europe. The university has fallen into decay. In its neighborhood, which produces excellent wine, are the ruins of Pæstum, which was destroyed by the Saracens in the 9th century. Of ancient Salernum or Salurnum, there still exist the Temple of Neptune, that of Ceres, and the ruins of an amphitheater and of a theater. S. was founded by the Greeks; it became important under the Roman empire, then passed into the possession of the Goths, and of the Lombards. Robert Guiscard made himself master of it in 1076. Charles V. united it to the kingdom of Naples.

SALERNO, GULF OF (anc. *Sinus Pæstanus*, on whose shores, in early times, the Greek city of Pæstum [q. v.] stood), is a nearly semicircular indentation on the western shores of Southern Italy, south-east of the Bay of Naples, from which it is separated by the promontory ending in Point Campanella. The Gulf is 36 miles wide at its entrance, and sweeps inland for 24 miles. On its shores are the towns of Amalfi and Salerno.

SALES, FRANCIS DE, a most distinguished saint of the Roman Catholic Church, was born August 21, 1567, at the family castle of Sales, near Annecy in Savoy. He was the heir of the family honors, and his education was designed by his father to fit him for the career of distinction to which his position seemed to entitle him. From the provincial colleges of La Roche and Annecy, he was sent to Paris in 1578, where he entered the then brilliant school of the Jesuits, and completed under their care the course of rhetoric and philosophy. In 1584, he went to Padua, for the course of civil law, and pursued his studies there with great distinction till 1591. At this time, his father, who had obtained for him a place in the senate, proposed to him a very brilliant and advantageous marriage, but he had already resolved to devote himself to the ministry, and with much difficulty obtained his father's consent to enter into orders in the diocese of Geneva. He soon became distinguished as a preacher, and the zeal with which he discharged the ordinary duties of his ministry was no less remarkable. Very soon after his ordination, he was employed by his bishop in a mission for the conversion of the Calvinistic population of Chablais, which had been recently annexed to the duchy of Savoy, and in which the duke was desirous of having the Catholic religion re-established. The success of this mission was almost unprecedented. With a companion equally devoted, he traveled on foot from town to town, and in a short time he succeeded in reclaiming many to the church. One of the most remarkable incidents of his mission was a conference with the celebrated Calvinist leader, Theodore de Beza. Of this interview, very different accounts are given by the rival partisans; but all agree in admiration of the gentleness and enlightened liberality of Francis de Sales. At the termination of this mission, Francis was, in 1596, appointed coadjutor to the Bishop of Geneva, Mgr. Granier, with the title of Bishop of Nicopolis. It was with much difficulty that the pope, Innocent IX., induced him to accept this dignity. Some time afterwards, having occasion to go to Paris, he was invited to preach the Lent in the chapel of the Louvre; and his lectures, which were partly controversial, were reputed to have had so much influence in bringing about the conversion of several of the Huguenot nobles, that the king tried to induce him to accept a French bishopric; but in vain.

He returned to his diocese; and soon afterwards, on the death of Mgr. Granier, he succeeded to the bishopric of Geneva. His administration of this charge, upon which he entered in December 1602, was beyond all praise. Being again invited to preach the Lent at Dijon, in furtherance of the plans of Louis XIV. for the conversion of the Huguenots, he was again pressed by that monarch to accept a French bishopric. But he again declined this honor, as he also declined in 1607 the offer of the cardinalate from the pope Leo. XI. It was about this time that he published his well-known *Introduction to a Devout Life*, which has continued to the present day one of the most popular manuals of piety and the ascetic life. Among his measures for the renovation of the monastic spirit, a very important one was the establishment of a congregation of nuns of the order of the Visitation, under the direction of the now celebrated Madame de Chantal, with whom he long maintained a correspondence on every subject connected with the spiritual and religious life, which was published in 1660, and which still remains a subject of almost undiminished interest for the spiritualist. In 1608, his infirmities compelled him to solicit the assistance of a coadjutor in the charge of his diocese. He continued, however, to labor to the last. His last sermon was

delivered at Lyon on Christmas eve in 1622; on Christmas-day he was seized with paralysis, and on the 28th of the same month, he expired. He was buried in the church of the Visitation in that city, but his remains were afterwards translated to Annecy. More than forty years after his death, in 1665, he was solemnly canonized as a saint by Alexander VII. His festival is held on January 29, the day of the translation of his relics to Annecy. His works were published in a collected form in 2 vols. folio at Paris in 1641; but the separate works (especially the *Devout Life*, which has been translated into almost every European language), have passed through innumerable editions, and still retain their popularity.

SALEY'ER ISLANDS, THE, lie in the Indian Ocean, to the south of Celebes. Upwards of thirty of the group are small, hilly, densely wooded, and, with few exceptions, uninhabited. Great Saleyer, in 5° 44′—6° 26′ S. lat., and 120° 23′—120° 37′ E. long., is upwards of 40 miles in length, and 7 in breadth, the area being 336 sq. miles. The mountains on the east coast rise abruptly out of the sea, and along the west is a slip of level land planted with cocoa-nut trees. Pop. 60,000. Great Saleyer and the smaller islands produce fine timber, including ebony and teak. Indigo, coffee, and mustard are grown; but millet, maize, earth-fruits, and cotton are the staple cultures, the grounds being carefully fenced. Agriculture is the chief employment, and fishing, making salt, &c., are also carried on. The exports are cocoa-nuts, cocoa-nut oil, cotton, and cotton-fabrics. Imports—rice, gambir, tobacco, yarns, iron and copper wares. Since the Netherlands' government made Macassar a free port, sea-going ships are not permitted to anchor at Saleyer; and the trade is carried on by small vessels, which sail between that island, the Bight of Boni, Sumbawa, Bali, Borneo, Java, Macassar, and Singapore. The sea is rich in various kinds of fish—a long and thin species, the Saleyer, giving a name to the island.

The S. I. are governed by fourteen rajahs, superintended by a Netherlands' agent. The natives are Mohammedans, each large village having a mosque and priest. The high priest resides near the political agent, has a seat in the council, and is consulted on religious questions. Some of the rajahs and notables have tables and chairs, tea and dinner services, silver spoons and forks, mattresses, cushions, and even satin bed-curtains.

SA'LFORD, a municipal and parliamentary borough, Lancashire, is considered as virtually a portion of the city of Manchester (q. v.).

SA'LICIN ($C_{26}H_{18}O_{14}$) is a member of the group of organic compounds to which the term *glycosides* has been recently applied by chemists—a group which is specially characterized by the fact, that each of its members, when exposed to certain chemical agencies, breaks up (usually after the absorption of water) into glycose (or grape-sugar) and other compounds. It occurs in the bark of the various species of willow and poplar, in the blossoms of several species of *spiræa*, and probably in the animal secretion known as *castoreum*. It may be obtained in small, colorless, glistening prisms of an intensely bitter taste, which are readily soluble in hot water and in alcohol, and moderately soluble in cold water, and are insoluble in ether and oil of turpentine; and its solutions exert a left-handed rotatory action upon a ray of polarized light. When heated to 248°, salicin fuses; and at a higher temperature, it is entirely decomposed. It dissolves in strong sulphuric acid, the solution being of a purple or blood color. Salicin is manufactured to a considerable extent as a cheap substitute for quinia. There are various modes of extracting it from the macerated bark; and 1 lb. of the bark of *Salix pentandra* yields, according to Erdmann, 5 drachms of salicin. If it is not so certain in its action as a febrifuge as quinia, there can be no doubt that it is an excellent tonic; and it possesses this advantage over the latter substance, that it is less liable to irritate the stomach. Dr. Neligan, in his excellent work on *Medicines*, states that he has used it very extensively as a tonic in the debility following acute diseases, particularly in cases accompanied by irritability of the digestive organs, and considers its powers to be fully equal to those of sulphate of quinia. As a tonic, two grains may be given three or four times a day; as a febrifuge, from one to two scruples in divided doses, during the intermission. *Salicylic Acid*, a derivative of S., is a powerful anti-ferment and antiseptic. It may be obtained from carbolic acid.

SA'LIC LAW. The code known as the *Salic Law* is a collection of the popular laws of the Salic or Salian Franks (see FRANKS) committed to writing in barbarous Latin in the 5th c., while the people were yet heathens. There exist several texts of this code, and considerable obscurity rests over its history. It relates principally to the compensation and punishment of crimes, and there is a chapter containing provisions regarding the succession to what are called *Salic Lands*, which seems to have been inserted at a later date. It is difficult to determine precisely what these lands were. The *terra salica* was probably so called from its being more especially attached to the *sal* or hall of the lord or proprietor (some derive *salic* as applied to the people from the same word); it thus came to designate inherited land as opposed to property acquired otherwise. Although the Frankish law did not in general exclude females, the succession to these salic lands whatever they were, was confined to males, probably from the importance of securing the military service of the chief proprietors. It was but a doubtful analogy that led the rule of succession to Salic lands to be extended to the succession to the French crown, and it seems to have been only in the 14th c. that the exclusion of females from the throne became an established principle. The accession of Philip the Long was probably the first occasion on which it received public sanction, and the fact that Edward III. rested his claim on female succession, doubtless led to that instance being regarded as an unquestionable precedent for all future time.—See Hallam's *Europe in the Middle Ages;* Guizot, *Essais;* and the *Lex Salica with the Glosses*, by Hessels (1880).

SA'LIENT, in Heraldry, an attitude of a lion or other beast, differing but slightly from *Rampant* (q. v.). He is supposed to be in the act of springing on his prey, and both paws are elevated. Two animals *counter-salient* are represented as leaping in opposite directions.

SALIENT, in Fortification, is that which points outwards from the interior of any work. For example, the central angle of a bastion, pointing towards the enemy, is a salient angle.

SALI'FEROUS SYSTEM, the name given by the earlier English geologists to the New Red Sandstone (q. v.) formations, because the deposits of salt in England occur in these strata. As, however, this substance has been found associated with strata of all ages in different parts of the world, the name has been given up.

SA'LIFIABLE BASE, a term applied in chemistry to any substance capable of uniting with an acid to form a salt.

SALI'NA, or SALINI, one of the Lipari Islands (q. v.).

SA'LINE PLANTS are those which require for their healthy and vigorous growth a considerable supply of *chloride of sodium* (common salt) and other salts, and which are therefore limited to peculiar situations. Few of them are strictly aquatic plants, except the marine Algæ, or Sea-weeds, which grow immersed in salt-water, either always or in certain states of the tide, and derive their nourishment from it through their fronds, and not by roots from the rock to which they are attached. Grass-wrack (q. v.), however is an instance of a phanerogamous plant living entirely and always immersed in salt-water. Other phanerogamous plants grow chiefly or only on the sea-shore and in salt marshes. Some of these, however, as the sea-kale, may be cultivated in gardens remote from the sea, but they succeed best when liberally supplied with salt. Asparagus is another well-known garden-plant, which derives much benefit from similar treatment. Some of the Saltworts (q. v.) and other saline plants yield much soda when collected and burned, and the produce was at one time largely imported into Britain from Spain and other countries under the name of Barilla (q. v.). The dry steppes of Russia and Tartary, having in many places a strongly saline soil, are covered with a very peculiar vegetation. Among the ornaments of these steppes is *Halimodendron argenteum*, a shrub of the natural order *Leguminosæ* often cultivated in gardens for its beautiful rose-colored flowers and silvery gray leaves. Saline plants have their whole tissues impregnated with salt.

SALINE POWDER, COMPOUND, is a very popular and harmless form of aperient medicine. The ordinary method of preparing it is by drying, at a gentle heat, and then pulverizing 4 oz. of pure chloride of sodium (common salt), 4 oz. of sulphate of magnesia (Epsom salts), and 3 oz. of sulphate of potash. These salts must then be mixed and triturated together, and kept in an air-tight vessel. Two or three drachms dissolved in half a pint of water, and taken before breakfast, usually act efficiently. Dr. Neligan states that if 4 oz. of sulphate of soda be used instead of the sulphate of potash, and a sufficiently high temperature be employed to expel all the water of crystallization from the different ingredients, one drachm of the resulting compound acts as energetically as two or three drachms of the ordinary powder.

The following is a more agreeable form than the preceding, and equally efficacious. Take half an ounce of carbonate of magnesia, and an ounce of each of the following substances—viz., sulphate of magnesia, bicarbonate of soda, tartrate of soda and potash, and tartaric acid. Expel all the water of crystallization, and mix. This powder, if kept dry, effervesces when mixed with water, and one or two teaspoonfuls form the average dose. The addition of a drop of oil of lemon and a little powdered white sugar to each dose, makes this one of the most agreeable laxatives that can be prescribed.

SALINS (anc. *Salinæ*), a town of the dep. of Jura, France, 52 miles north-by-west from Geneva, on the Furieuse, a feeder of the Doubs. It is situated in a narrow rocky gorge between two lofty hills, looking upon a fertile and beautiful valley. It derives

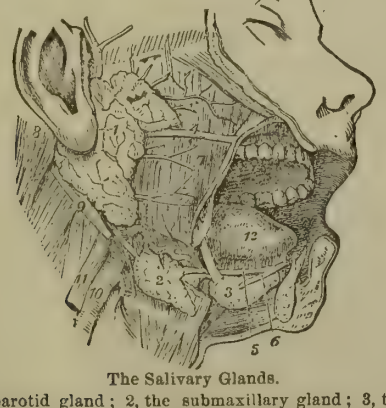
its importance from its salt-works, from which also it has its name. The salt is obtained from brine-springs, and the evaporation of the brine is mostly carried on in a great building, in the valley below the town, which has long borne the name of the *Salines Royales;* but that of the weaker springs is conveyed in pipes to the forest of Chaux, 15 miles off, where it is first slowly evaporated in *maisons de graduation*, and afterwards by boiling. There are iron-works, soda-factories, tanneries, and quarries of gypsum in S. and its immediate neighborhood. Pop. (1876) 5577.

SA'LISBURY, or NEW SARUM, the capital of Wiltshire, is an episcopal city, and a municipal and parliamentary borough, and stands in a fertile valley on the Avon, at the junction of that river with two of its affluents, 83 miles south-west of London by the South-western Railway, and 23 miles north-west of Southampton by a branch of the same. Its several parts are connected by three bridges. The town dates from 1220, in which year the cathedral was founded, and the inhabitants of Old Sarum (see SARUM, OLD) two miles to the north, removed to S., attracted to the new site by the abundant supply of water. At the foundation of the town, the ground was divided into squares or 'chequers' as they are called, to which the town is indebted for its appearance of airiness and regularity. The cathedral, the principal building of S., is one of the finest specimens of Early English in the country. It was begun in 1220, and was finished in 1258. The spire, which was added after the building was completed, is the 'most elegant in proportions and the loftiest in England.' Its height from the pavement is 400 feet, only 60 feet less than that in Strasburg. The cathedral is 449 feet long; height in the interior, 81 feet; width of great transept, 203 feet. It is in the form of a double cross, is perfect in its plan and proportions, and in the main uniform in style. The west front is still rich, beautiful, and graceful, though now denuded of statues, upwards of 100 in number, with which it was once enriched. The cathedral has been recently restored. The manufactures of cutlery and cloth, for which it was once famous, have long declined and its trade is now chiefly in retail. Pop. (1871) 13,839; (1881) 15,659. It returns two members to parliament.

SALISBURY PLAIN, an extensive tract of undulating chalk country, in Wiltshire, between Salisbury and Devizes, about 20 miles long from north to south, and about 14 miles broad. Its rolling surface resembles that of the ocean heaving after a storm. On this plain, about 8 miles north of Salisbury, is Stonehenge (q. v.). Until within recent years, the expanse of S. P. remained in a state of nature, and was covered with a fine turf, which afforded pasture to sheep. The natural features of the plain, however, are now much changed. North and south of Stonehenge, wild slopes of thistle-covered turf still extend; but both east and west of it, the country is laid out in cultivated fields; and within gun-shot of the desolate old relic, is a neat modern farm-house.

S'ALIVAHANA is the name of a Hindu prince who is said to have reigned in Magadha or South Behar. He instituted an era which bears his name, and the beginning of which took place when 3179 years of the Kali-yuga, or the present mundane age, had expired; that is, 78 years after the beginning of the Christian era. This era is called S'âliyâhana S'âka, or simply S'âka. Thus 1865 of the Christian era would be tantamount to S'âka (i. e., in the S'aka era) 1787. The S'âka year is the same as, and begins with, the common solar year.

SA'LIVARY GLANDS. Under this name we designate three pairs of glands—the parotid, the submaxillary, and the sublingual,



The Salivary Glands.

1, the parotid gland; 2, the submaxillary gland; 3, the sublingual gland; 4, Steno's duct; 5, Wharton's duct; 6, Bartholin's duct; 7, masseter muscle; 8, mastoid process; 9, digastric muscle; 10, internal jugular vein; 11, external carotid artery; 12, the tongue.

each gland having an efferent duct, which conveys the glandular secretions into the mouth, where, when mixed with the mucus secreted by the follicles of the mucous membrane lining the mouth, they constitute the ordinary or mixed saliva.

The *Parotid Gland*, so called from the Greek words *para*, near, and *ous*, the ear, is the largest of the three glands occurring on either side. It lies upon the side of the face immediately in front of the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the calibre is about that of a crow-quill.

The *Submaxillary Gland* is situated, as its name implies, below the jawbone (part of which is cut away in the figure), and is placed at nearly equal distances from the parotid and sublingual glands. Its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the *frænum* of the tongue.

The *Sublingual Gland* is situated, as its name implies, under the tongue, each gland lying on either side of the *frænum* of the tongue. It has a number of excretory ducts, which open separately into the mouth.

The minute structure of the parotid gland is described in the article GLANDS, and the other salivary glands are similarly constituted. True salivary glands exist in all mammals, except the cetacea, in birds, and reptiles (including amphibians), but not in fishes; and glands discharging a similar function, occur in insects, many molluscs, &c. The chemical and physical characters of the saliva are sufficiently described in the article DIGESTION.

The most common disease of the parotid gland is a specific inflammation, which has been already described in the article MUMPS. The term *Parotid Tumors* is given to tumors of various kinds occurring in front of the ear and over the parotid gland. With regard to surgical interference, Liston recommends that 'if there be reason to suspect that the disease is of a malignant nature, and not thoroughly limited by a cellular cyst, no interference is admissible; if, on the contrary, it be at all movable, has advanced slowly, possesses a smooth surface, and is firm, then an operation may be contemplated.'

Certain functional disorders of the salivary glands require notice, of which the most important is that known as *Salivation* (q. v.), or *Ptyalism*, which consists in a much increased secretion of saliva. *Deficient Secretion* is indicated by clamminess or dryness of the mouth, and is common in low forms of fever. It is important as indicating the condition of the system, and seldom requires treatment. If it should occur as an original affection, it must be treated by local Sialogogues (q. v.), such as liquorice, horse-radish, pellitory, &c. *Alteration of the Saliva* is not unfrequent in disease. For example, it sometimes loses its alkaline character, and becomes acid, as in acute rheumatism, diabetes, &c.; whilst in other cases, it becomes so fœtid as to be a source of annoyance both to the patient and his friends, as, for example, in scurvy, various forms of dyspepsia, salivation, &c. The undue acidity may be corrected by the administration of carbonate or bicarbonate of soda, while the fœtor may be relieved by attention to diet, and by the use, both local and general, of creosote, nitromuriatic acid, charcoal, chlorate of potash, &c.

Ordinary inflammation of these glands (distinct from mumps) may proceed from cold or local injury, but it is often produced by decayed teeth.

SALIVA'TION, or PTY'ALISM (from the Gr. *ptyalon*, the saliva), is the term employed to designate an abnormally abundant flow of saliva. It most commonly arises from a specific form of inflammation of the parotid glands, induced by the action of mercury, in which case it is termed mercurial salivation; but it occasionally arises from the action of other drugs, especially iodide of potassium; and sometimes it occurs without any apparent cause, in which case it is said to be *idiopathic* or spontaneous.

Mercury, in some form or other, is so common an ingredient in the quack medicines whose advertisements are unfortunately allowed to occupy a large space in many of our newspapers (especially in those medicines which are falsely stated to be of purely *vegetable origin*), that a popular knowledge of the most remarkable manifestations of this powerful mineral should be as widely diffused as possible. When this medicine is given in such a way as to excite salivation, a metallic taste in the mouth is soon recognized by the patient, and a remarkable but indescribable smell, known as the mercurial fœtor, may be detected in his breath; the gums become swollen and spongy at their edges, and usually present a few slight ulcers; and an increased flow of saliva takes place, accompanied by pain in the teeth on pressure. If these symptoms be not checked (and *a fortiori* if more mercury be given), the tongue, cheeks, and throat swell and ulcerate, and the saliva that flows away amounts to several pints in the course of the day. This peculiar action of mercury varies extremely in different persons. Dr. Watson, in his 14th Lecture, records several remarkable cases in which a single small dose of mercury produced the severest salivation. Cases of the opposite kind, in

which no impression on the gums or salivary glands can be made by the freest use of mercury, are by no means uncommon. It is worthy of notice that salivation is rarely produced in children below the age of ten years.

Until a comparatively recent period, profuse salivation was deemed the only certain indication that the system was duly under the influence of mercury (and, indeed, it was believed that the cause of the disease was carried out of the body with the saliva); but now it is well known that all that is requisite is, that the gums should become distinctly tender, and that the mercurial fœtor should be unmistakably present, and that those symptoms should be kept up for a certain time. Unfortunately, however, the physician cannot always stop the action of the mercury at that definite stage, and salivation to a distressing extent often occurs, even when the greatest care has been taken in the administration of the medicine. To check this excessive salivation, the internal administration of chlorate of potash in scruple doses, three times a day, together with the frequent use of a gargle of the same salt has been recommended by several high authorities. Dr. Watson strongly advocates the use of a gargle composed of one part of brandy to four or five of water, and the application of moistened tannin to the gums; and when there is much external swelling, he applies eight or ten leeches beneath the edges of the jaw-bones, followed by the application of a soft hot poultice to the neck.

It is worthy of notice that, in the confluent form of small-pox, there is almost always more or less abundant salivation, which lasts for several days; and if it cease abruptly, the peril is usually great. Moreover, there is a more or less marked tendency to salivation in scurvy, hysteria, hydrophobia, some forms of mania, and not unfrequently in pregnancy.

Various cases of spontaneous salivation have been collected by Dr. Watson in his 44th Lecture. In one instance of a girl ten years old, under his own care, no less than three pints of saliva were excreted in twelve hours. Medicine had no effect; but the salivation finally ceased spontaneously after a severe attack of influenza. In these cases, astringent washes, as a solution of alum, or the infusion of catechu, or a few drops of creosote suspended by mucilage in water, are deserving of trial.

SA'LIX. See WILLOW.

SA'LLEE, or SLA, a seaport town of Morocco, in the territory and former kingdom of Fez, 106 miles west from Fez. It stands on a low sandy point of the shore of the Atlantic, at the mouth of the Bu-Regreb, on the northern side of the river, whilst opposite to it, on the southern side, is the town of Rabat. Both S. and Rabat were bombarded and nearly destroyed by the French in 1851. S. was in former centuries noted as a haunt of pirates, and a *Sallee Rover* was the dread of peaceful mariners in the Atlantic and Mediterranean. It is particularly noted for the carpets which it produces, of fine texture and bright colors. They are mostly used in Morocco itself. The chief export from S. is wool. Pop. estimated at about 12,000, of whom 3000 are Jews.

SA'LLOW, the popular name of a number of species of Willow (q. v.), trees or low shrubs with downy branches, and generally ovate or obovate, wrinkled leaves, having stipules. The GRAY S. (*Salix cinerea*) is one of the most common British species,

Gray Sallow (*Salix cinerea*).

growing in moist and swampy places. Other common species are the ROUND-EARED S. (*S. aurita*) and the GREAT ROUND-LEAVED S. (*S. caprea*), the latter remarkable for preferring a dry soil, and becoming a small tree, the wood of which is used for the handles of agricultural implements. The LONG-LEAVED S. (*S. acuminata*) differs from the other kinds in its lanceolate leaves. It is frequent in Britain. None of the sallows produce such long and slender twigs as the osiers, nor are they adapted for any but the coarsest wickerwork, and some of them are so apt to break that they cannot easily be used in that way. But shoots of two years' growth are split up, and used for making hoops of barrels.

SALLOW-THORN (*Hippophaë*), a genus of plants of the natural order *Elæagnaceæ*, consisting of large shrubs or trees with gray silky foliage, and entire leaves. They have diœcious flowers: the perianth is tubular, becomes succulent, encloses an achenium, and forms an acid fruit. Few species are known: one only is European, *H. rahmnoides*, sometimes called the SEA BUCKTHORN, a large shrub or low tree, a native of the sandy sea-

Sallow-thorn (*Hippophaë rhamnoides*):
a, Branch of the female plant, in fruit; *b*, branch of male plant, in flower.

coasts of England and the continent of Europe. It is found also throughout great part of Tartary. It is sometimes planted to form hedges near the sea, growing luxuriantly where few shrubs will succeed. The berries are orange-colored. They are gratefully acid. They are used for making a sauce in the south of France: a rob or jam is made of them on the shores of the Gulf of Bothnia, to impart flavor to fresh fish; and a preserve or jelly made from them is a favorite luxury of the Tartars. The *stellate* hairs of the underside of the leaf, covering it like scales, are a beautiful microscopic object.

SA'LLUST, CAIUS CRISPUS, a Roman historian, was born 86 B.C., at Amiternum, in the Sabine country. Though of a plebeian family, he rose to official distinction, first as quæstor about 59, and afterwards as tribune of the people in 52, when he joined the popular party against Milo, who in that year had killed Clodius. His reputation for morality was never high; and his illicit connection with Milo's wife is assigned as the cause of his being expelled in 50 from the senate, although his attachment to Cæsar's party is a more plausible reason of his expulsion. In the civil war, he joined the camp of Cæsar; and in 47, when Cæsar's fortune was in the ascendant, he was made prætor-elect, and was consequently restored to his former rank. When in Campania, at the head of some of Cæsar's troops, who were about to be thence transhipped to Africa, he nearly lost his life in a mutiny.

In 46, however, we find him engaged in Cæsar's African campaign, at the close of which he was left as governor of Numidia. His administration was sullied by various acts of oppression, particularly by his enriching himself at the expense of the people. He was, for these offences, accused before Cæsar, but seems to have escaped being brought to trial. His immense fortune, so accumulated, enabled him to lay out those magnificent grounds, still known as the gardens of Sallust, on the Quirinal, to retire from the prevailing civil commotion into private life, and to devote his remaining years to those historical works on which his reputation rests. He died 34 B.C., four years before the battle of Actium. His histories, which seem to have been begun only after his return from Numidia, are: 1st, The *Catilina*, or *Bellum Catilinarium*, descriptive of Catiline's conspiracy in 63, during the consulship of Cicero; 2d, The *Jugurtha*, or *Bellum Jugurthinum*, commemorating the five years' war between the Romans and Jugurtha, the king of Numidia. These, the only genuine works of S. which have reached us entire, are of great but unequal merit. The quasi-philosophical reflections which are prefixed to them are of no value, but the histories themselves are powerful and animated, and contain effective speeches of his own composition, which he puts into the mouths of his chief characters. With its literary excellence, however, the value of the *Jugurtha* stops, as in military, geographical, and even chronologi-

cal details, it is very inexact. His now lost work, *Historiarum Libri Quinque*, is believed to have described the events occurring between Sulla's death, 78 B.C., and the year of Cicero's prætorship, 66. The *Duæ Epistolæ de Republica Ordinanda*, and the *Declamatio in Ciceronem*, are of doubtful authenticity.

Apart from his literary qualities, which are rather those of an artificial than a natural writer, and which are not enhanced by his affectation of brevity, and his love of archaic expressions, S. has the merit of having been the first Roman who wrote what we now understand by 'history.' In official public life, he was more of a politician than a statesman, and the views which he supported were liberal, not so much because he loved the people, as because he hated the nobility. The best editions of his literary remains are those of Corte (Leip. 1724), Gerlach (Basel, 1823—1831), Kritz (1828—1834), Fabri (1831), Dietsch (1842), and the German critical edition of 1859.

SA'LLY-PORT, a gate or passage by which the garrison of a fortress may make a sally (through Fr. from Lat. *salio*, I leap or spring) or sudden attack on the besiegers. The name is applied to the postern leading from under the rampart into the ditch; but its more modern application is to a cutting through the glacis, by which a sally may be made from the covert-way. When not in use, sally-ports are closed by massive gates of timber and iron.

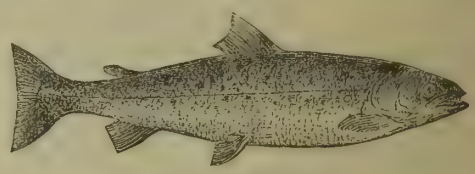
SALMASIUS. CLAUDIUS, the Latinized name of a celebrated French scholar, CLAUDE DE SAUMAISE, who was born at Semur, 15th April 1588. His father, Benigne de Saumaise, a man of superior erudition, was his first teacher. At the age of ten, young S. translated Pindar, and composed Greek and Latin verses. He studied philosophy at Paris, under the superintendence of Casaubon. From Paris he proceeded to Heidelberg, where he devoted himself to the science of jurisprudence, and publicly professed Protestantism, to which form of the Christian religion he had been secretly attached for many years. So insatiable at this time was his thirst for knowledge—book-knowledge, at least—that he was wont to devote two whole nights out of three to hard reading, in consequence of which he brought himself to within an inch of the grave. In 1608, he published from MSS. two treatises of the sectary, Nilus, Archbishop of Thessalonica, and a work of the monk Barlaam on the primacy of the pope. In 1629, appeared his chief work, *Plinianæ Exercitationes in Caii Julii Solimi Polyhistora* (2 vols., Par. 1629); after the publication of which, he set himself vigorously, and without the help of a master, to acquire a knowledge of Hebrew, Arabic, Coptic, and other oriental tongues. In 1631, he was called to Leyden, to occupy the chair that Joseph Scaliger had held there, and it is from this period that his European reputation as a scholar and critic dates. Various efforts were made (1635—1640) to induce S. to return to France, but he declined them on the ground that his spirit was too 'liberal' for his native land.

Queen Christina of Sweden, however, managed to bring him to Stockholm, and fix him there for a year (1650—1651), after which he returned to Holland. He died of a fever caught by imprudently drinking the waters at Spa, 6th September 1658. S. was certainly a great scholar of the old-fashioned clumsy sort; but neither his wit nor his acumen was sufficiently keen to give an intellectual and critical value to his lucubrations; and though all his distinguished contemporaries, Casaubon, Gronovius, Grotius, Vossius, &c., deluged him with praise; though Balzac pronounced him *infallible;* though the curators of the university of Leyden declared that 'their university could no more do without Salmasius than the world without the sun;' though Queen Christina went the length of saying, with truly royal flattery, 'that she could not live without him'—he is remembered, not for his inexhaustible stores of erudition, his editions of the classics, or his treatises on classical antiquities, but for his controversy with John Milton, scarcely his inferior in scholarship, and infinitely his superior in power of brain, and in all the arts of literary warfare. The question at issue was the lawfulness of the execution of Charles I. Apart altogether from the merits of the case, the great poet utterly overwhelmed his adversary, partly by the magnificence of his language and sentiments, and partly by the unscrupulous fury of his invective. S. also is grossly abusive and acrimonious in his treatise (*Defensio Regia pro Carolo I.*, 1649): *asinus* (ass), *pecus* (beast), and such-like expressions being showered about quite freely; but he is deficient in logic, in real force of sarcasm, and in intellectual vigor generally.

SA'LMON (*Salmo*), a genus of fishes of the family *Salmonidæ* (q. v.), which as characterized by Cuvier, has teeth on the vomer, both palatine bones, and all the maxillary bones; and includes numerous species more recently divided by Valenciennes into three genera, *Salmo*, *Fario*, and *Salar:* the first characterized by a few teeth at the end of the vomer; the second, by a single line of teeth running down the vomer; the third, by two rows of teeth on the vomer, without any remarkable group at its upper end. To many naturalists, however, this division seems too artificial; and the characters, although excellent for distinguishing species, not such as ought to divide genera; an opinion confirmed by the fact, that the teeth are numerous along the vomer in the young of the species, as the Common S., which finally retain only a group of them at the end. The division made by Valenciennes separates the S., the Salmon Trout, and the Gray or Bull Trout, the only British species which ascend rivers from the sea, into the two genera *Salmo* and *Fario;* whilst the Common Trout is referred to *Salar*. A much more natural division, having regard to characters really conspicuous and important, and to the habits of the species, is the simple one of Mr. Pennell (*The Angler Naturalist*, 1863), which is really nothing more than a formal recognition of groups practically recognized by every one acquainted with the fishes which compose them: '1. The Silver, or Migratory species (i. e., those migrating to and from the sea); 2. The Yellow, or Non-migratory species; 3. The Charrs, or Orange and Red-colored species.' The present article is devoted to the first of these groups. The second is noticed in the article TROUT; the third in the article CHARR.

By far the most important of the three *Salmonidæ* which ascend the rivers of Britain from the sea is the SALMON (*Salmo salar*), in commercial importance far superior to any other fresh-water fish, both on account of the abundance in which it is procured in the northern parts of the world, and of its rich and delicious flavor. From ancient times it has furnished important supplies of food; and the S. fisheries of Britain have long been a subject of anxious attention to the legislature. Even rivers of Iceland now yield a rent, and are regularly netted for the supply of the British market, to which the S. are brought, as from other northern regions, fresh, in ice. Many rivers and streams, also, are rendered valuable by the S. which periodically visit them, as affording sport to anglers with which nothing of the same kind is deemed worthy of comparison, and those of Norway, as well as those of Britain itself, are now frequented by British anglers.

The S. is one of the largest species of the genus, having been known to attain the weight of 83 lbs., whilst S. of 40 or 50 lbs.,



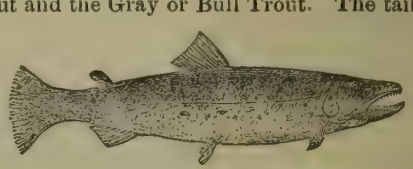
Salmon (*Salmo salar*).

and even upwards, are occasionally brought to market. Very large S., however, are not common, owing to the eagerness with which the fishery is prosecuted. No fish is more symmetrical or beautiful than the S.; and its form is admirably adapted to rapid motion even against powerful currents, by the regular tapering from the front of the first dorsal fin both to the snout and to the tail, but more suddenly in the former direction, by the nearly equal convexity of back and belly, and by the perfect smoothness and want of angularity. The head is about one-fifth of the whole length of the fish. The under-jaw of the male becomes hooked during the breeding season with a kind of cartilaginous

Salmon Trout (*Salmo trutta*).

excrescence, which is used as a weapon in the combats then frequent, wounds so severe being inflicted with it that death sometimes ensues. The lateral line is nearly straight. The scales are small, and the color a rich bluish or greenish-gray above, changing to silvery-white beneath, sprinkled above the lateral line with rather large black spots.

The opercular bones show a rounded outline at the hinder edge of the gill-covers, which at once distinguishes this species from the only other British species that can be confounded with it, the Salmon Trout and the Gray or Bull Trout. The tail is forked in



Gray, or Bull Trout (*Salmo eriox*).

the young S., but becomes nearly square in the adult. The mouth of the S. is well furnished with teeth; a line of teeth on each side of the upper jaw; an inner line on the palatine bone,

two or three in the adult state at the end of the vomer, two rows on the tongue, and one row along the outer edge of each lower jaw-bone. This array of teeth indicates voracity, and the S. seems to prey readily on almost any animal which it is capable of capturing, though it is a somewhat singular fact, that the stomach when opened is rarely found to contain the remains of food of any kind: two or three herrings of full size have, however, been found in its stomach; the sand-launce and other small fishes seems to constitute part of its food; and when in fresh water, the minnow, trout-fry, or the fry of its own species, worms, flies, &c. The angler catches S. with the artificial fly, or with the minnow or the worm; and no bait is more deadly than the roe of the S. itself, the use of which is indeed prohibited in British acts of parliament intended for the protection of the S. fisheries. The eggs of crustaceans have also been found in the stomach of the S. in such quantities as to show that they form a very considerable part of its food.

The S. is found on the coasts of all the northern parts of the Atlantic, and in the rivers which fall into that ocean, as far south, at least, as the Loire on the European side, and the Hudson on the American. Slight differences can be noted between the American and the European S., but they are not generally thought sufficient to distinguish them as species. The S. frequenting one river, are, indeed, often characteristically different from those of another river of the same vicinity. The S. is not found in the Mediterranean nor in the Black Sea, nor in any of the rivers falling into them; and in the Arctic Ocean and its rivers, as well as in the northern parts of the Pacific Ocean, other species of the same genus take its place. The preservation of S. in a fresh state by means of ice, being an invention of recent times, this fish never appeared at the luxurious tables of ancient Rome except dried or salted, although its excellence was well known, the Romans having become acquainted with it in their northern conquests. S. is in perfection for the table only when recently taken from the water; whilst the fatty 'curd' remains between the flakes of its flesh, which, however, begins to disappear within 12 hours, although otherwise the fish is quite fresh. Hence the peculiarly high value formerly ascribed in London to *Thames salmon*.

The S., after its first migration to the sea, passes a great part of its life in it, although under the necessity of periodically ascending rivers, in which the S. that ascend to spawn or for other causes in autumn, often remain during most of the winter. S. return, in preference, to the same rivers in which they have passed the earliest part of their existence; as appears both from records of marked S., and from the characteristic differences already alluded to. S. ascend rivers to a great distance from the sea, as the Rhine to the Falls of Schaffhausen, and the Elbe to Bohemia. The speed with which they glide through the water in their most rapid movements is very great; it is said to be not less than 1500 feet in a minute, or at the rate of 400 miles a day; but this, of course, is sustained only for a few moments, and the ordinary rate of progress in ascending rivers is supposed to be from 10 to 25 miles a day. The fish, also, almost always chooses to lie for a time in

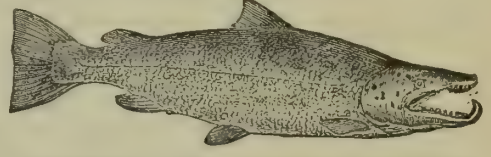
Salmon-ladder.

some spot, waiting a fresh flood in the stream. The perpendicular height which the S. can pass over by leaping, when there is abundance of water in the river and sufficient depth in the pool below the fall, seems to be not more than 12 or 14 feet; they attempt higher leaps, but often fall back exhausted, or fall on adjacent rocks, where they die or are captured. They do, however, rush up steep and broken cataracts of much greater height. The ascent of many rivers by S. has been stopped by high weirs and other obstructions; but very simple and effectual means have been devised for preventing this by *fish-stairs* or *fish-ladders*, which are often very conveniently formed by partitioning off a portion of the fall, and intersecting it from alternate sides, two-thirds of its width, by transverse steps of wood or stone, so as partially to divide it into a succession of falls. The S. soon find out the ladder, and leap up from one step to another. By this, the interests of manufacturers and of fishery proprietors are in some measure reconciled.

As the time of spawning, approaches, S. undergo considerable changes of color, besides the change of form already noticed in the snout of the male. The former brilliancy of the hues gives place to a general duskiness, approaching to blackness in the females, much tinged with red in the males; and the cheeks of the males become marked with orange stripes. S. in this state are 'foul fish,' being considered unfit for the table, and the killing of them is prohibited by British laws, notwithstanding which, however, multitudes are killed by poachers in some of the rivers, nor do those who eat them either fresh or 'kippered' (i. e., dried) seem to suffer from any unwholesomeness, such as is sometimes alleged to belong to them, although they are greatly inferior in quality to S. in other states. S., which have completed their spawning, continue for sometime, at least if in fresh water, very unfit for the table. Their capture is prohibited by British laws. They are called '*foul-fish*,' or more distinctively, '*spent fish*,' or *Kelts;* the males are also called *Kippers*, *kip* being a name for the cartilaginous hook of the under jaw, and the females *Shedders* or *Baggits*. Such names, originally local, have become of more general use from having been introduced into acts of parliament. The name *Kelt*, in particular, is now very commonly employed. When they remain for a considerable time in fresh water after spawning, kelts recover very much, and increase in weight, whereas, before spawning, there is a diminution of weight. 'A well-mended kelt' approaches in quality to a good or 'clean' S., although far from being equal to it.

The time of spawning is from the end of autumn to the beginning of spring, or even the beginning of summer; differing considerably in different rivers, whilst in each river it is prolonged throughout months, the elder and stronger fish of the former year probably ascending to spawn first. The difference of season in different rivers is probably to be accounted for by the temperature of the water, as affected by latitude, and by the relations of the river to lakes, to low warm plains, and to snow-covered mountains.

S. spawn on beds of fine gravel, in shallow parts of rivers, such



Old Male Fish, or Kipper, during the Spawning-season.

as are used for the same purpose by trout. Some beds of this kind, in salmon-frequented rivers, have been notable from time immemorial as favorable spawning-places; and large numbers of fish, both the S. and its congeners, deposit their spawn in them every year. The spawning female approaches the bed, attended by at least one male fish, sometimes by more than one, in which case fierce combats ensue; she makes a furrow in the gravel with her tail, and deposits her spawn in it, on which the male afterwards pours the vivifying melt. It was formerly believed that the furrow was in part made by the snout of the fish, and to this the snout of the male at the spawning season was supposed to be particularly adapted; but it has been found by observation that the snout is not used in this work. The eggs, when deposited and vivified, are covered by the action of the tail of the female; the male doing nothing but depositing his melt, and fighting with any other of his sex that may attempt to dispute his place.

The time occupied by a female S. in spawning is from three to twelve days. After spawning, the S. generally soon descends to the sea. The descending *kelts* are very ravenous, and therefore a great annoyance to anglers who desire to take none but *clean* fish, and must return the kelts to the water.

The eggs deposited in the spawning bed are liable to be devoured by trouts and other fishes, which are ever ready, and by insect larvæ of many kinds, which work their way even through the gravel; ducks and other waterfowl also search there for their food; and sometimes a flood changes the bed so much as either to sweep away the eggs, or to overlay them with gravel to a depth where they are never hatched, or from which the young can never emerge. The number of eggs hatched in ordinary circumstances must be small in proportion to the number deposited, and by far the greater part of the fry perish before the time of descent to the sea.

In from thirty to sixty days after the deposition of the eggs in the spawning bed, they begin to show signs of life, and the eyes appear as small specks. The time which elapses before the egg

is hatched varies according to the temperature of the water, and therefore is generally shorter in England than in Scotland, 140 days being sometimes requisite in cold climates and late springs; whilst it has been found that in a constant temperature of 44° F. sixty days are enough, and in a higher temperature eggs have been hatched even in thirty days. A temperature above 70° F.

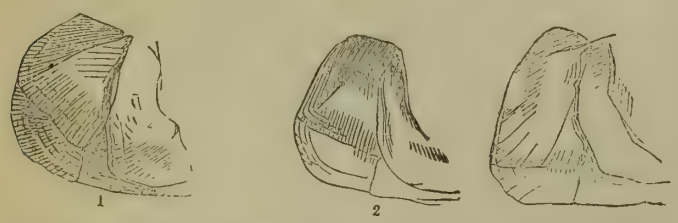
Salmon Ova, and Newly Hatched Fish.

(Copied from the *Field* newspaper.)

1, egg of salmon, natural size, just taken from the parent fish; 2, the same, with the eyes of the young fish just becoming apparent; this takes place about the thirtieth or thirty-fifth day, according to the temperature; 3, the young fish coiled up in the egg, and just ready to be hatched; 4, the young fish emerging from the shell; 5, the empty egg-shell, showing longitudinal rent made by the young fish; 6, young salmon about two days old, natural size; 7, the young salmon (about two days old), magnified; the umbilical vesicle, containing the yelk and the oil globules, and blood-vessels ramified on its surface; also the head with the huge eyes and badly-developed mouth (a portrait); the fins and the thin transparent body, the fins not as yet being developed into their proper shape, are carefully delineated.

is, however, fatal to them. S. eggs are easily hatched in an aquarium, in which proper care is taken to prevent stagnation of the water, so that the conditions may resemble those of a bed of gravel in a running stream. Many interesting observations were thus made by the late Frank Buckland on the development of the young S., of which the results were from time to time given to the world through the columns of the *Field* and *Land and Water* newspapers, and his excellent work on *Fish-Hatching*.*

The young fish lies coiled up in the egg, which it finally bursts in its struggles to be free, and it issues with a conical bag (umbilical vesicle) suspended under the belly, containing the red yolk of the egg and oil globules, which afford it nourishment during the first five or six weeks. The mouth is at first very imperfectly developed, as are the fins, and the whole body has a shape very different from what it is soon to assume, and is very delicate, and almost transparent. The slightest injury is fatal. The length, at first, is about five-eighths of an inch. About the seventh or



Gill-covers of Salmon (1), and Salmon Trout (2). Gill-covers of Bull Trout.

eighth week, the young S. has changed into a well-formed little fish about an inch long, with forked tail, the color light brown, with nine or ten transverse dusky bars, which are also more or less distinctly visible in the young of other species of this genus, just as the young of many feline animals exhibit stripes or spots which disappear in their mature state. The fry, previously very inactive, now begin to swim about, and seek food with great activity, and are known as PARR, or SAMLET, and also in some places by the names *Pink*, *Brandling*, and *Fingerling*. The Parr was formerly supposed to be a distinct species (*S. salmulus*), an opinion to which many anglers, eager to enjoy their summer holidays, and catching parr by scores with the artificial fly or worm when they can catch nothing else, have clung tenaciously, after it has been shown to the satisfaction of all naturalists that the parr is nothing else than the young salmon. The honor of proving this belongs to Mr. Shaw, of Drumlanrig, Dumfriesshire, by experiments made in 1834—1836. They have been fully confirmed at the salmon-breeding ponds of Stormontfield, on the Tay.

It was long urged, to prove the parr a distinct species, that the male parr is very often found with the milt perfect, to which, however, it was replied that the female parr is almost never found with perfect roe. But the remarkable fact has now been abundantly proved that the male parr is capable of impregnating the roe of the female S., and thus a provision seems to be made in nature to prevent an otherwise possible loss of roe. And, indeed, ridiculous little parrs seem to be always ready at hand to perform this service during the combats of the great fish, or in their absence. Another remarkable fact has been discovered, that some parrs descend to the sea in their first year, whilst others remain in the fresh water, and in the parr state, without much increase of size for another year, and a few even to the third year. At Stormontfield it has been found that about one-half of the parrs migrate when a year old. No reason can be assigned for these things; the facts alone are known to us, and have but recently been established.

The parr attains a size of from 3½ to 8 inches. When the time of its migration comes, usually in May or June, it assumes brilliant silvery hues, the fins also becoming darker, and is then known as a *Smolt*. Groups of smolts, 40 to 70 in a group, now descend, not very rapidly, to the sea. They remain for a short time in brackish water, and then depart from the estuary. Of their life in the sea nothing is known, except that they increase in size with wonderful rapidity; for it has been found that smolts which had been marked, returned to the same river in six or eight weeks as *Grilse* of three to five pounds, or, after a longer period, even of eight or nine pounds. Some reascend the rivers when only a pound and a half or two pounds weight, and these are in some places known as *Salmon Peal*. Grisle are captured in great numbers in the latter part of summer and in autumn, but very few are seen in the earlier part of the fishing season.

The grilse usually spawns on its first return to the fresh water—often remaining there for the winter, and on again descending to the sea assumes the perfect characters of the mature salmon. Little increase of size ever takes place in fresh water; but the growth of the S. in the sea is marvelously rapid, not only on its first migration, but afterwards. A kelt caught by the late Duke of Athole on 31st March weighed exactly ten pounds. It was marked, and returned to the Tay, in the lower part of which it was again caught, after five weeks and two days, when it was found to weigh twenty pounds and a quarter.

The statistics of S. fisheries are, like those of other fisheries, very imperfect. It is impossible to ascertain the total annual value of the S. fisheries even of Great Britain and Ireland; but it must be reckoned by hundreds of thousands of pounds. 'From the Reports of the Irish Commissioners, we learn that, in 1862, apparently an ordinary year, three Irish railways conveyed 400 tons, or about 900,000 lbs. of salmon, being equal in weight and treble in value to 15,000 sheep, or 20,000 mixed sheep and lambs. In Scotland, the Tay alone furnishes about 800,000 lbs., being equal in weight and treble in value to 18,000 sheep [and lambs]. The weight of Salmon produced by the Spey is equal to the weight of mutton annually yielded to the butcher by each of several of the the smaller counties. . . . . And in making comparisons between the supplies of fish and of flesh, it must be kept in mind that fish, or at least salmon, though higher in money value, cost nothing for their keep, make bare no pasture, hollow out no turnips, consume no corn, but are, as Franklin expressed it, "bits of silver pulled out of the water." '—(Russel, *The Salmon*, p. 12). In 1880, the number of boxes of S. sent from Scotland to London was 17,408; from Ireland, 9666; from England, 1993. The other British species yet to be noticed in this article are reckoned with the S. itself in all that relates to S. fisheries.

The S. fisheries of the British rivers have in general much decreased in productiveness since the beginning of the present century, which is very much ascribed to the introduction of fixed or standing nets along the coast, by which S. are taken in great numbers before they reach the mouths of the rivers to which they are proceeding, and in which alone they were formerly caught; it having been discovered that S. feel their way, as it were, close along the shore for many miles towards the mouth of a river, feeding, meanwhile, on sand-launces, sand-hoppers, and other such prey. It is also partly owing to the destruction of spawning fish by poachers; and in no small measure to the pollution of rivers consequent on the increase of population and industry, and to the more thorough drainage of land, the result of which has been that rivers are for a comparatively small number of days in the year in that half-flooded condition in which S. are most ready to ascend them. The last of these causes is the most irremediable; but if the operation of the others were abated, it would not of itself be sufficient to prevent a productiveness of our rivers much greater than the present. The efforts which have begun to be made by breeding-ponds (see PISCICULTURE) to preserve eggs and fry from destruction, and so to multiply far beyond the natural amount the young S. ready to descend to the sea, promise also such results as may yet probably make the supply of S. *far* more abundant than it has ever been. There is reason to think that the produc-

* See the *Acclimatization of the Salmonidæ at the Antipodes*, by A. Nicols (1882).

tiveness of the waters may be increased as much as that of the land.

The stake net is the most deadly of all means employed for taking S.; and its use is prohibited in estuaries and on some other parts of the coast. It consists of two rows of net-covered stakes so placed between high and low water marks, that S. coming up to them, and proceeding along them, are conducted through a narrow opening into what is called the *court* of the net, from which they cannot find the way of escape. The *cruive*, which is now illegal in all parts of Britain, is an enclosed space formed in the wall of a dam or weir, into which the S. enter as they ascend the stream, whilst a peculiar kind of grating prevents their return. The nets employed for catching S. in rivers and estuaries are of many different kinds. In many places a small boat, or *salmon coble*, is used to carry out a seine net from the shore, setting (*shooting*) it with a circular sweep, the concavity of which is towards the stream or tide, and men stationed on shore pull ropes so as to bring it in by both ends at once with whatever it may have enclosed. Coracles (small boats of basket-work or a light wooden frame covered with canvas and tar, or other waterproof material) are used in S. fishing in the Severn and other Welsh rivers. Nets which a single man can carry and work are also used in many rivers and estuaries, as those called *halves* on the Solway, which may be described as a bag attached to a pole. Dogs have sometimes been trained to drive S. into nets, and some dogs have attained great expertness in catching S. without any assistance.

The SALMON TROUT (*S. trutta*, or *Fario argenteus*), also very commonly called the SEA TROUT, is rather thicker in proportion to its length than a S. of the same size, and has the hinder free margin of the gill-cover less rounded. The jaws are nearly equal; the teeth strong, sharp, and curved, a single row running down the vomer, and pointing alternately in opposite directions. The colors are very similar to those of the S.; the sides, chiefly above the lateral line, are marked with numerous X-shaped dusky spots and there are several round dusky spots on the gill-covers. The salmon trout does not attain so large a size as the S., but has been known to reach 24½ lbs. The flesh is pink, richly flavored, and much esteemed, although not equal to that of the salmon. Great quantities of salmon trout are brought to market in London and other British towns; this fish being found from the south of England to the north of Scotland, and plentiful in many rivers, particularly those of Scotland. Its habits are generally similar to those of the salmon. Large shoals sometimes congregate near the mouth of a river which they are about to enter, and sometimes afford excellent sport to the angler in a bay or estuary, rising readily to the fly. The young are not easily to be distinguished from parr. *Phinock*, *Hirling*, and *Whitling* are local names of the salmon trout on its first return from the sea to fresh water, when it has its most silvery appearance, in which state it has sometimes been described as a distinct species (*S. albus*).

The GRAY TROUT or BULL TROUT (S. *eriox*), the only other British species migrating like these, is already noticed in the article BULL TROUT. The gill-cover in this species is more elongated backwards at the lower angle than in the other two. On the banks of the Tweed and some other rivers, it is often called the sea trout, a name quite as appropriate to it as to the salmon trout. The seasons at which the gray trout ascends rivers are partly the same with those of the S. and salmon trout, and partly different. The laws relative to the fishing of S. apply equally to the bull trout.

Of other species of S. our notice must be very brief. Cuvier has described as a distinct species a S. with hooked lower jaw, known in France by the name of *Becard*. Agassiz and Bloch regard it as merely the old male of the Common Salmon. The hooked lower jaw of the male of the Common S. in the spawning season has been already noticed. But Valenciennes adheres to the opinion of Cuvier that the *Becard* is a distinct species, and insists on the greater length of the intermaxillary bones as a sure distinctive character; asserting also that the colors are always different from those of the common S.; a general reddish-gray, the belly dull white, the back never blue, nor the belly silvery. The subject seems to require further investigation.—The HUCHO of the Danube, called *Reo* in Galicia (*S. Hucho*), attains a weight of 30 lbs., and it is said even of 60 lbs. The body is longer and rounder, the head more elongated than in the Common Salmon. The color is grayish-black, tinged with violet on the back, the sides and belly silvery. The tail is forked. The hucho spawns in June, making holes for the purpose in gravelly bottoms; and these holes are so deep that the fish lying in them often escape the nets of the fishermen. The flesh is white, but very pleasant. The same, or a very similar species, is found in the Caspian Sea, and in rivers which flow into it.—The rivers of North America which flow into the Arctic Ocean, produce several species of S., of which perhaps that most nearly resembling the Common S., in the quality of its flesh is *S. Hearnii*. In these regions, ROSS'S *S.* (*S. Rossii* or *Fario Rossii*) is extremely abundant. It is of a more slender form than the S., with remarkably long lower jaw and truncated snout; the scales separated by naked skin; the back greenish-brown, the sides pearl gray, the belly orange or red. In the quality of its flesh it is very inferior to the salmon.—*S. Scouleri*, or *Salar Scouleri*, ascends the Columbia and other rivers of the north-west coast of North America in vast multitudes. In arms of the sea on that coast it is sometimes impossible for a stone to reach the bottom without touching several; and the channel of a river or a brook is often densely crowded with them. The flesh is excellent. The same species seems to ascend the rivers of Kamtchatka; but that country, the Kurile Isles, and Siberia have also species of their own. Concerning many of the species there is still great uncertainty. See SALMON, and PISCICULTURE.

ANGLING FOR SALMON.—The capture of the salmon by rod and line affords the most exciting sport of the kind. The pleasures of it have been descanted on by numerous writers, and whole treatises have been written on the minutiæ of the art. Among the more modern writers, on the subject we may name Davy, Stoddart, Colquhoun, Younger, Stewart, Francis, and Russel. The tackle used is sufficiently described in the article ANGLING; and the general principles of fly-fishing there laid down are applicable in this case. The chief specialty in salmon angling is to be able to maintain perfect coolness and vigilance when the fish is hooked. The rod must be kept at such an elevation as to bring its elasticity into play; and by allowing the line to run out as the fish dashes off, and winding it up as he returns, or by following his motions, if need be, in person, a constant and equal strain must be maintained; a sudden tug at an unyielding line, or a momentary slackening, being equally fatal. After struggling for from a quarter to half an hour (sometimes, though rarely, for two or three hours) against a steady pull, the fish generally yields to his fate and allows himself to be drawn into the shallow and landed. This is done either with the gaff; or the fisher, winding his line up within rod length and holding the top landwards, without slackening, seizes the fish with one hand by the root of the tail, and lifts, or rather slides him headforemost on to the gravel or grass.

Those rivers of Britain where the fishing is strictly preserved, still afford good sport; but of late many anglers betake themselves to Norway or even Canada for their favorite sport. In 1877 it was estimated that the salmon fishings of England were worth £30,000, of Ireland £400,000, and of Scotland, £200,000. Recently the salmon and other fish of the rivers of Britain have suffered terribly from a disease of which a cause or consequence is the growth on the fish of a fungus, *Saprolegnia ferax*. See an article by Prof. Huxley in *Nature*, vol. xxv.

SALMON-FISHERY LAWS.—The salmon is protected by peculiar laws in the United Kingdom. I. As to England.—The right to fish salmon in the sea and navigable rivers belongs to the public as a general rule; and the right to fish salmon in rivers not navigable belongs to the riparian owner on each bank, the right of each extending up to the center line of the stream. But though the public have, as a rule, the right to fish in the sea and navigable rivers, there are various exceptions, which arose in this way. Previous to Magna Charta, the crown, whether rightly or wrongly, assumed power to make grants to individuals—generally the large proprietors of lands adjacent—whereby an exclusive right was given to such individuals to fish for the salmon as well as all other fish within certain limits. This right, when conferred, often applied to the shores of the sea, but generally prevailed in navigable rivers and the mouths of such rivers. The frequency of such grants was one of the grievances redressed by Magna Charta, which prohibited the crown thenceforth from making like grants. But the then existing grants were saved, and hence every person who at the present day claims a several or exclusive fishery in navigable rivers, must show that his grant is from the crown, and is as old as Magna Charta. It is not, however, in any way necessary that he be able to produce a grant or chain of grants of such antiquity; for if he has been in undisturbed possession for a long time—say sixty years and upwards—it is presumed that such title is as old as Magna Charta, and had a legal origin. When a person is entitled to a salmon fishery (and if he is entitled to a salmon fishery he is entitled also to the trout and other fish frequenting the same place), he is nevertheless subjected to certain restrictions as to the mode of fishing salmon. These restrictions are imposed by the Salmon Fishery Acts of 1861, 1865, and 1873, which repealed prior acts of parliament.

No person is now entitled to use lights, spears, gaffs, strokehalls, snatches, or other like instruments for catching salmon; nor can fish roe be used for the purpose of fishing. All nets used for fishing salmon must have a mesh not less than two inches in extension from knot to knot, or eight inches measured round each mesh when wet. No new fixed engine of any description is to be used. A penalty is incurred for violating these enactments, and also for taking unseasonable salmon, or for taking, destroying, or obstructing the passage of young salmon, or disturbing spawning salmon. The close time, during which no salmon shall be

fished, extends from 1st September to the first February following, except that for rod fishing the close season shall not commence till 1st November. These periods may by bye-laws be slightly varied for each district. During close time no salmon can be legally sold or be in the possession of any person for sale; and such fixed engines as are still legal shall be removed or put of out gear during close time. Moreover, throughout the year, there is a weekly close time—that is to say, no person can, except with rod and line, lawfully fish salmon between 12 A.M. (noon) of Saturday to 6 A.M. of Monday following. Though owners of dams need not make fish-passes, there must be free gaps made in fishing weirs of a certain width. For the purpose of supervising the enforcement of the acts, fishery inspectors are appointed for England. Fishery Boards were established in 1866, and by bye-laws can change close seasons, license duties for fishing instruments, mesh of nets, and other matters, within limits. See also POACHING.

II. In Scotland, there are various important differences from the law of England as regards salmon fisheries. In Scotland, the general rule is that all salmon fisheries in the rivers and surrounding seas are vested in the crown, and hence no person is entitled to fish with nets or engines except he can show a grant or charter from the crown. If he can only show a general grant of fishings without specifying salmon, then it is necessary not only to produce such grant, but to show that he has been in exclusive possession for forty years and upwards of the salmon fishings. Moreover, while this right to catch salmon by nets is vested in the crown, or in some grantee of the crown, the right to angle for salmon is now held to be included, and does not belong to the riparian owner. The public, *qua* public, have no right anywhere in Scotland to fish for salmon either with net or rod. By virtue of many old statutes, all fixed engines for catching salmon are illegal, and it is settled that everything is in the nature of a fixed engine which is not held in the hand of the fishermen while they are fishing; but a mechanical contrivance, which enables the fisherman to go a little further into the river with his coble or boat, which is to drag the net, is not illegal. Stake nets, however, are not illegal if they are not in a river or the mouth of a river. In 1862 and 1868, statutes were passed for regulating the Scotch salmon fisheries. By these acts fishery districts are authorized to be managed by boards. These boards consist of the large proprietors of fisheries. The boards appoint constables, water-bailiffs, and watchers, forming a kind of river police. The board has power to assess the various proprietors in sums so as to raise funds for paying the expenses of working the act—like funds being raised in England only by license duties. The annual close time for salmon fishing is fixed by the commissioners, and varies in each district, but it generally extends from 27th August to 10th February following; the angler's close time commencing about 16th October. The commissioners are appointed by the Home Secretary, their duties being to fix the limits of fishery districts and of rivers, to make general regulations as to close time, cruives, nets, &c. The Scotch acts imitate the English acts in prohibiting fishing with lights or salmon roe, with nets having small meshes, &c. And there is a weekly close time from 6 P.M. on Saturday to 6 A.M. on Monday following.

III. Ireland.—The Irish salmon fishery laws are regulated chiefly by statutes distinct from those of England. Fishery districts are there established, and the fisheries are subject to rates and license duties for the purpose of raising funds. There is an annual and weekly close time, and fixed engines are prohibited, and free gaps enforced in all fishing weirs.

SALMON OF NORTH-WESTERN AMERICA. The rivers of North-western America abound in salmon and trout to a degree not exceeded, and perhaps not equalled, in any other part of the world. Since the article SALMON was written, a very interesting account of the most important species has been given by Mr. J. K. Lord, in his work entitled *The Naturalist in Vancouver Island and British Columbia* (2 vols., Lond. 1866), to which we are indebted also for accounts of the Candle-fish, Vancouver Island Herring, and viviparous Fish. The first place must be given to *Salmo Quinnat*, of which Quinnat is one of the Indian names, a fish similar in quality to our European salmon, and sometimes 70 lbs. in weight. It is very thick in proportion to its length, the dorsal outline slightly arched, almost forming a notch with the tail. The back is light steel blue, shading to a lighter tint on the sides, and imperceptibly changing to gray or silvery white, blushed over with pink, on the belly. The upper parts, and often also the lower, are thickly spotted with black stars. Salmon of this species ascend the Columbia, the Fraser, and other rivers in prodigious numbers, at the spawning season, and proceed hundreds of miles, and even in the Columbia 1000 miles, from the sea into every rivulet, 'filling even pools left on the prairies and flats by the receding floods.' In what multitudes they crowd up the rivers will be even better understood from the following statements of Mr. Lord, relating to a tributary of the Fraser. 'About a mile from my camp was a large patch of pebbly ground, through which a shallow stream found its way into the larger river. Though barely of sufficient depth to cover an ordinary-sized salmon, yet I have seen that stream so filled, that fish pushed one another out of the water high and dry upon the pebbles. . . . . With one's hands only, or, more easily, by employing a gaff or crook-stick, tons of salmon could have been procured by the simple process of hooking them out.'

Mr. Lord goes on to express his opinion that thousands of the salmon ascending the small mountain-streams never can spawn from sheer want of room. He describes them as dying by scores at the base of a waterfall which they could not leap, where, however, they persisted in remaining till they died from inanition, fresh fish coming up as the dead ones floated down. A prodigious stench arises from the multitude of dead salmon floated down the rivers. The Indians say that all the salmon of this species that come up to spawn die in the rivers; and Mr. Lord believes that few, if any, ever reach the sea again. They seem not to eat when in the fresh water, and cannot be tempted either by fly or bait, nor is any food to be found in their stomachs, although, in the stomachs of those taken in the tideway or salt water, the remains of small fish and marine animals are to be found. This kind of salmon ascends the rivers in June and July, for, unlike the salmon of Britain, it spawns in summer.—At the same time with *Salmo Quinnat*, a smaller species, called by the Indians, at the Kettle Falls, the Cha-la-lool (*Salmo Gairdneri*), ascends the rivers. Its average weight is only from eight to eleven pounds, but when it first arrives in the fresh water, its flesh is fat, pink, firm, and most delicious.—A little later in the season, comes the WEAK-TOOTHED SALMON (*Salmo paucidens*).—The autumn, also, has its supply of salmon, quite equal to that of spring in point of numbers, but inferior in quality. They ascend the rivers in September and October. The autumnal salmon (*Salmo lycaodon* of Pallas), a species known also in Northern Asia, is a dingy hook-nosed fish, called *Hooked Snout* by the fur-traders. The hooked snout, however, is peculiar to the males. Salmon of this species are to be found 'in every stream and rill where they can by any possibility work a passage,' and they often remain in fresh water, far from the sea, for four or six months, all of them becoming emaciated, and many of them dying, whilst the snout of the male becomes prodigiously elongated, and the teeth also increase into tusks. As to the multitudes of the full-grown fish of this species to be found at the proper season in the rivers of North-western America, the following extract from Mr. Lord's book is conclusive

'At Fort Hope, on the Fraser River, in the month of September, I was going trout-fishing in a beautiful stream, the Quaquealla, that comes thundering and dancing down the Cascade Mountains, cold and clear as crystal; these salmon were then toiling up in thousands, and were so thick in the ford that I had great trouble to ride my horse through: the salmon were in such numbers about his legs as to impede his progress, and frightened him so that he plunged viciously, and very nearly had me off.'—The RED-SPOTTED SALMON TROUT (*Salmo spectabilis*) is another valuable fish of the same regions. It seldom exceeds three pounds in weight. It ascends the rivers in October, when a great Indian fish-harvest takes place. This fish is readily taken by hooks baited with dried salmon-roe, or by a small shining strip fom the belly of a trout.—The OREGON BROOK TROUT (*Salmo* or *Fario stellatus*) abounds in the rivers and streams of North-western America, even to a height of 7000 feet in the Rocky Mountains. It attains a weight of three pounds, and is a delicious fish. This trout is readily taken with fly or bait.

The Indians of these regions take the salmon, as they ascend the rivers, by various contrivances. They construct weirs reaching from one side of a stream to the other, with openings, through which the fish pass into large lateral prisons of closely woven wicker. They use nets in the bays and harbors, when the salmon, pursuing anchovies and herrings, run into the net, and are caught, and thus immense numbers are taken. They construct rude scaffolds or stages of wood among the boulders on the sides of large rivers, on each of which many Indian fishers await the salmon, with small nets fastened to handles, forty or fifty feet in length. Thirty salmon an hour is not an unusual take for two Indians to land on a stage. Another and more curious method, practised at falls, is by means of great wicker hampers, about 30 feet in circumference, and 12 feet in depth, which are fastened to the smaller ends of huge trees placed so as to overhang the foaming water, and where the salmon generally leap. In each basket two naked Indians are stationed to catch and kill the fish that fall into the baskets. The Columbia River produces more salmon in one year than the whole of the rivers of the United Kingdom taken together. In an average year, the rivers of the United Kingdom have been calculated to yield about 1,000,000 salmon, while the yield of this river in 1881 was 1,500,000. The value of the British Columbia fisheries in 1881 was £300,000; 177,000 cases of tinned salmon were put up in the same year; and the number of vessels employed was 666; of persons, 2893.

SALMO'NIDÆ, a very large and important family of malacopterous fishes, of the suborder *Abdominales* (having the ventral fins on the abdomen, and behind the pectorals), nearly allied to *Clupeidæ* (the Herring family), but at once distinguished by the second dorsal fin, which they all have, and which is merely a fold of the skin, enclosing fat, whence it is called the *adipose fin*, and destitute of rays. They were all included by Linnæus in the genus *Salmo*, although now divided not only into numerous genera, but by many naturalists into several families, of which one retains the name of S., and the other principal ones are *Characinidæ* and *Scopelidæ*. The S. are generally very muscular, and possess great strength, swimming with great rapidity, even against strong currents, and some of them are capable of leaping up falls of considerable height, when there is sufficient depth of water beneath. Some of them are sea-fishes, never entering rivers, although, like the herring, pilchard, &c., they approach the shore to spawn; others are generally inhabitants of the sea, but ascend rivers to spawn, and some of them also on other occasions not yet well understood; others, again, are constant inhabitants of fresh-water lakes, or of rivers and streams. Most of them are esteemed for the table, and some are among the most esteemed of fishes.

The restricted S. of those naturalists who divide the family, are all scaly fishes, but with the head destitute of scales, and the cheeks fleshy; the upper part of the mouth is formed by the premaxillary and maxillary bones together; the branchiostegal rays are numerous; the air-bladder is large and simple; the teeth are usually small, sometimes very numerous, the tongue being furnished with them, as well as the other parts of the mouth, although others have the teeth few and small, or even wanting. They are generally voracious fishes, feeding chiefly on other fishes, crustaceans, worms, &c. The Salmon, Salmon Trout, Bull Trout or Gray Trout, Trout, Charr, Grayling, and Smelt, are familiar British examples.

The White Fish of North America is one of the most important species, and to the same genus (*Coregonus*) belong many others, inhabiting the lakes and rivers of the northern parts of the world, some of them, from their herring-like appearance, known as *Herring-Salmon* and *Freshwater Herring*. The Capelin (q. v.) is a sea-fish, never entering fresh waters. The restricted or true S. are found only in the northern parts of the world, and chiefly in the colder regions.

The *Characinidæ* also have the body scaly, and the head destitute of scales; the upper part of the mouth is formed by the premaxillaries and maxillaries together; there are only four or five branchiostegal rays; the air-bladder is divided by a constriction in the middle; the teeth are very various, wholly wanting in a few, numerous in most of the genera, present on the tongue in some, and not in others; small and feeble in some, in others large and strong; in many conical and sharp, in some flat. Most of the species feed on animal food, but a few on vegetable food alone; whilst some are omnivorous, eating with equal readiness worms or other soft animals and fruits which fall into the water. One of those feeding exclusively on vegetable substances is the Pacu (*Myletes Pacu*), a fish scarcely excelled by any as an article of food, which has teeth very like the molar teeth of sheep, and employs them in browsing on the plants that grow on rocks covered with water, near the cataracts of the rivers of Guiana, and in some of the tributaries of the Amazon. In form, it is very unlike the trout or salmon, being short, thick, and clumsy. This, however, is not unfrequent in the *Characinidæ*, which exhibit much greater variety of form than the S. proper. Thus, in some of the genus *Serrasalmo* (see PIRAYA), of which there are many species, voracious carnivorous fishes with sharp trenchant teeth, the depth of the body is almost as great as its length. The species of *Serrasalmo* are sometimes called *Saw-bellied Salmon*, from their keeled and serrated belly. The *Characinidæ* are all inhabitants of fresh waters; some of them African, but the greater number South American. Their flesh is generally much esteemed.

The *Scopelidæ* differ from both the previous sections of S. in the structure of the mouth, which is formed entirely of the premaxillary bone, the maxillary lying behind. Few of them have an air-bladder. Some are scaly, and some destitute of scales. The form of the body is salmon-like in some, but deep and compressed in others. They are generally marine, as the Argentine (q. v.), the only British species. They abound chiefly in the warmer seas; the Mediterranean produces some; but the greater number belong to the Chinese and East Indian seas. Some are in high repute for their fine flavor.

Australia produces none of the Salmonidæ. The rivers and streams of that region, however, as well as those of New Zealand, Patagonia, and the Falkland Islands, produce a number of species of *Galaxias*, a genus of very trout-like form, but with no scales and no adipose fin. They are called *trouts* by the colonists in Australia and New Zealand, but are of very inferior quality for the table.

SALOMON, JOHANN PETER, an eminent musician, violin-player, and composer, born at Bonn in 1745. When young, he was attached to the service of Prince Henry of Prussia, for whom he composed several operas. In 1781, he visited Paris, and afterwards London, where he met with so warm a reception, that he was induced to settle there. His series of subscription concerts in London, in 1790, form an era in the history of music, in so far as they led to the production of Haydn's twelve grandest symphonies, known as the Salomon set. In 1800, S. retired from public life, but continued to compose songs, glees, and violin solos and concertos. He died in 1815, and was interred in Westminster Abbey.

SALONI'KI (anc. *Thessalonica*, Turk. *Selanik*), a town of European Turkey, in the vilayet of the same name, and, next to Constantinople, the greatest emporium of commerce in the empire, is situated on the Gulf of Saloniki, and rises from the shore along the face of a hill. The city is enclosed by white walls, partly ancient and partly medieval, about five miles in circuit, and is surrounded by cypresses and other evergreens. As seen from the sea, it presents a bright and beautiful appearance; but its internal aspect is miserable in the extreme. The principal buildings are mosques, most of which were previously Christian churches. The *Citadel*, called by the Turks Vedi-Kuleh, or 'the seven towers,' is the ancient Acropolis; within it are to be seen the ruins of a triumphal arch belonging to the time of Marcus Aurelius. Other relics of antiquity are the Propylæum of the Hippodrome, a magnificent Corinthian colonnade of five pillars; the triumphal arch of Augustus, erected after the battle of Philippi (now forming the gate of Vardar or Vardari); the arch of Constantine, &c. S. exports the corn, cotton, wool, tobacco, beeswax, and silk of Macedonia. S. is connected by railway with Uskub, nearly 100 miles inland. In 1874, 1634 vessels, of 584,825 tons, entered and cleared the port. Pop. 70,000, of whom 30,000 are Turks, 20,000 Greeks, and 20,000 Jews.

S. was at first called Therma, under which designation it is mentioned in connection with the march of Xerxes through Greece. It was rebuilt by Cassander about 315 B.C., who probably named it Thessalonica in honor of his wife; and during the Roman-Macedonian Wars, it figures as the principal station of the Macedonian fleet. After the close of the civil wars, its prosperity rapidly increased, and for three centuries it was the first city in Greece. It was early the seat of a Christian church. During the barbarian invasions, it proved the great bulwark of the Eastern empire. It was thrice taken in the middle ages—first, by the Saracens in 904; secondly, by the Sicilian Normans in 1185; and thirdly, by the Turks under Amurath II. in 1430.

SALOO'P. See SASSAFRAS.

SA'LOP. See SHROPSHIRE.

SA'LPA, a genus of Molluscoids, of the division *Tunicata*, in which there is no shell, but a leathery tunic with two apertures; the type of the family *Salpidæ*, which float in the sea, and have the tunic transparent and elongated. They are allied to *Ascidia* (q. v.), although not fixed like them, and have two openings, through the hinder of which the water enters, and is expelled through the anterior by a regular contraction of the mantle, so that the animal is impelled through the water in a backward direction, without any apparent voluntary action. The *Salpæ* are sometimes solitary, and sometimes united in long chains, those in chains having the contractions of the individuals simultaneous; but the solitary *Salpæ* appear to be the parents of those which are in chains, and they in turn give birth to solitary individuals very different from themselves. The whole texture is very delicate, so that the animal is sometimes scarcely to be discerned, except from its iridescent hues in the sunshine, which make chains of *Salpæ*, when very numerous, a conspicuous feature in the surface of the great deep in tropical regions. The orifices of the alimentary canal are not near together, as in *Ascidia*, but at opposite extremities of the body.

The branchial chamber of *Ascidia* is represented by a wide membranous canal, traversed by a long vascular ribbon, which is continually exposed to the water that passes through the canal. The *Salpæ* united in chains have no organic connection, but apparently adhere together by little suckers.

SAL PRUNELLE. See NITRE.

SA'LSAFY, or SALSIFY (*Tragopogon porrifolius*), a biennial plant growing in meadows throughout Europe, not common, and perhaps not truly indigenous in Britain; cultivated in gardens for the sake of its root, which is used in the same manner as the carrot, and is very delicate and pleasant, with a flavor resembling asparagus or scorzonera. The root is long and tapering, and in cultivation white and fleshy, with much white milky juice; the stem 3—4 feet high, with smooth and glaucous leaves, which resemble those of leek; the flowers are of a dull purple color. The seed of S. is sown in spring, and the root is ready for use in winter. In the following spring, when the flower-stalks are thrown up, they are used like asparagus. Owing to a peculiar mode in which the roots are sometimes dressed, so as to have a flavor

somewhat like that of oysters, S. is sometimes popularly called the *Oyster Plant.*—The genus *Tragopogon* belongs to the natural order *Compositæ*, suborder *Cichoraceæ*, and is distinguished by one row of 8—10 bracts united at the base, a punctured receptacle, feathery pappus, and striated achenia with long beak.—The PURPLE GOAT'S BEARD (*T. pratensis*), a native of Britain was formerly cultivated in England for its roots, which are similar in quality to salsafy.

SALSE'TTÉ (native name *Sáshti*), an island on the west coast of British India, in the presidency of Bombay, lies immediately north of Bombay, with which it is connected by a long peninsula, and by an artificial embankment called Zion's Causeway. It is 18 miles long, and 11 miles in extreme breadth. Pop. about 50,000. It is beautiful, picturesque, and densely wooded, is diversified by mountain and hill, and contains many fertile tracts. Sugar, indigo, cotton, flax, and hemp are grown. Thanah, the chief town, stands on the east coast, 20 miles north-north-west of Bombay by the Great Indian Peninsular Railway, which, after traversing the islands of Bombay and S., crosses to the continent half a mile to the south of this town. Pop. about 12,000. A number of remarkable caves, called the Caves of Kánhari or Kenery, are found in the middle of the island, five miles west of Thanah. They are nearly a hundred in number, are all excavated in the face of a single hill, and contain elaborate carving. The caves are in six stories, on the ledges of the mountain, and the stories are connected by stairs cut in the rock. The cave first approached consists of three chambers, one unfinished, and dates from the 9th or 10th c. A.D.; it contains no figures or carvings. The other caves contain numerous carved representations of Buddha, many of them of colossal size. Relics and inscriptions are also found. There are caves in several localities of the island, besides those of Kánhari—e. g., those of Montpezir, Magatani, and Jageshwar. The caves are frequently the haunts of serpents and tigers. On the north, on the coast, is the small watering-place of Ghorá Bandar, which has been designated the Montpelier of Bombay. The fort of Thanah and the island of S. were taken by the English in 1774.

SALT, MANUFACTURE OF. See SODIUM. Common salt is either procured in the solid crystalline state, called *Rock-salt* (q. v.), as a natural brine from wells or springs, or by the evaporation of sea-water. In the first case it is obtained by mining, often at great depths, as at Northwich in Cheshire; at Salzburg, Magdeburg, Berchtesgaden, and Wimpfen in Germany; Cracow in Poland; in the Punjab and other parts of the world.

Rock-salt almost always contains impurities, and therefore is dissolved in water, and the insoluble matters mixed with it are deposited at the bottom. The brine is then drawn off, and evaporated by artificial heat in large iron pans.

Natural brine is obtained at Droitwich and Stoke in Worcestershire, and Nantwich in Cheshire. At Droitwich the shaft is only sunk 175 feet, and the brine rises to the surface, and overflows if not pumped. There are, however, reservoirs made for it, into which it is pumped, and from which it is distributed to the various works, which are little more than large sheds, with numerous openings in their roofs, to allow the steam free egress. Flues run from end to end of the floors, and on these rest the iron evaporating pans which are about 65 feet long by 25 broad, and about 18 inches in depth. In other places, very deep shafts have been sunk, and the brine requires to be pumped from a great depth. The flues heat the brine nearly to boiling-point, and as a large surface is exposed, the evaporation is very rapid, and the crystals are small, as in the fine table-salt. If, however, the heat is more gentle, the salt is coarser, and is fit for curing meat, fish, &c.; and when very slow, a much coarser kind, called *bay-salt*, is produced.

Salt is obtained from sea-water in many parts of the world, and this is effected by simply evaporating it in brine-pits or shallow square pools, dug on the shore for the purpose. When the evaporation has proceeded to a certain extent, the liquid assumes a reddish color; a pellicle of salt forms on its surface, which soon breaks, and sinks down, to be followed by another; and the crystallization then proceeds rapidly. When complete, the salt is removed to sheds open at the sides, and then piled in heaps, in order that the chloride of magnesium may be removed. This is very easy, for as it is extremely deliquescent, it liquefies by exposure to the atmosphere, and runs out. The salt is then redissolved and crystallized, if great fineness is required.

SALT, SIR TITUS, a public-spirited English manufacturer, born at Morley, 20th September 1803. He began business as a wool-spinner at Bradford in 1834, and was the first to introduce into England the manufacture of alpaca fabrics. He cherished a strong interest in the welfare of his work-people, and about 1850 established his factory in the healthy valley of the Aire, between Leeds and Bradford. Beside it he built the model village of SALTAIRE, containing a church, schools, a working-man's club (costing £30,000), baths, &c. The factory covers 12 acres. S. was returned to parliament in 1859, and was made a baronet in 1869 He died 29th Dec. 1876. See his life by Balgarnie (1877).

SA'LTA, a town in the north-west of the Argentine Confederation, capital of a state. It is 3900 feet above sea-level, but is unhealthy. Pop. 11,000.

SALT-CAKE is a term used for the crude sulphate of soda made from oil of vitriol and common salt, and used in preparing carbonate of soda.

SA'LTCOATS, a seaport on the Firth of Clyde, county of Ayr, 30 miles S.S.W of Glasgow. S. is a great resort of sea-bathers. Pop. (1881) 5096.

SALTI'LLO, a city of Mexico, capital of the northern state of Coahuila. Pop. 12,000. Seven miles south is Buena Vista, where in 1847 the Mexicans were defeated by the U. S. army.

SALTING, the process by which animal and vegetable substances are preserved for food by the aid of common salt. This is either done by rubbing dry salt into the flesh to be preserved, and repeating the process from time to time, until it has absorbed sufficient to arrest decomposition; or the salt is liquified with a little water, and made into brine, in which articles are placed until required for use, when a little soaking and washing removes the superfluous salt. Vegetables are only salted in the latter way; and continental nations use it extensively for the preservation of various kinds of vegetable food for winter consumption. A little saltpetre is often added, and very much increases the efficiency of the common salt. See ANTISEPTICS, FOOD.

SA'LTIRE, one of the ordinaries in Heraldry, its name of uncertain etymology, representing a bend sinister conjoined with a bend dexter, or a cross placed transversely like the letter X. Like the other ordinaries, it probably originated, as Mr. Planché suggests, in the clamps and braces of the shield. The form of the saltire has been assigned to the cross on which St. Andrew is said to have been crucified; hence the frequency of this ordinary in Scotch heraldry. A saltire is subject to the variations of being engrailed, invected, &c., and may be *couped*. When two or more saltires are borne in a shield, they are couped, not at right angles, but horizontally; and as they are always so treated, it is considered superfluous to blazon them as couped. Charges disposed in the form of a saltire are described as placed *saltireways*, or *in saltire*. The former term is more properly applied to two long charges, as swords or keys, placed across one another (in which case the rule is, that the sword in bend sinister should be uppermost, unless otherwise blazoned); and the latter to five charges placed two, one, and two.

SALT LAKE CITY, the chief town and ecclesiastical capital of the Mormon territory of Utah, U. S., is on the east bank of the river Jordan, between Lake Utah and Great Salt Lake, 20 miles south of the latter, and 4350 feet above the level of the sea, 650 miles east-north-east of San Francisco, and 1100 west of the Mississippi. It was settled by the Mormons (q. v.) in 1847, and contains 260 lots of ten acres each; 4 public squares; shaded streets 128 feet wide, through each of which flows a stream of pure water from the neighboring mountains, 10,000 feet high, from which the gardens are irrigated. The houses are chiefly built of adobes, or sundried bricks, each wife in the polygamic families having a separate entrance. The principal edifices are the Mormon Temple, the Tithing-house or Treasury, and the Social Hall, which serves for ball-room and theater. Pop. (1870) 12,854; (1880) 20,561, of whom a third are 'Gentiles.'

SALT OF SATURN, a name for acetate of lead.

SALT OF SORREL, the common name for binoxalate of potash. See OXALIC ACID.

SALT OF TARTAR, a commercial name for carbonate of potash in a very crude form.

SALT OF TIN is the term employed by the dyer and calico-printer for protochloride of tin, which is extensively used as a mordant, and for the purpose of deoxidizing indigo and the peroxides of iron and manganese.

SALT RANGE, or KALABAGH MOUNTAINS, a mountain range in the Punjab, India, lies in an east and west direction, in lat. 32° 30'—33° 20'. The range rises on the west bank of the Jhelum, runs west to the Indus, and after affording a passage to the river, reappears on its west side, and pursues the same direction till it meets with the Suleiman Mountains. The S. R. is about 200 miles in length, and varies from 2000 to 5000 feet in height. Its appearance is exceedingly bleak and barren; vegetation is seldom met with; there are no trees; and the bold and bare precipices which frequently occur, give to the range a forbidding aspect. Rock-salt is found in inexhaustible quantities, and so pure, that after being pounded, it is ready for use. Alum, iron ore, coal, gypsum, and limestone abound; gold-dust is washed down in the sands of the rivers, and graphite is also found.

SALT, SPIRITS OF, the old name for muriatic or hydrochloric acid.

SALTS, SMELLING, a preparation of carbonate of ammonia with some of the sweet-scented volatile oils, used as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, and the oils are added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used. The celebrated Preston smelling-salts are scented with oils of cloves and pimento. The manufacture of ornamental bottles to contain this preparation is an important branch of the glass and silversmith's trades.

SALTS, THEORY OF. Any substance which is produced by the combination of a base with an acid, is commonly termed a *salt*. The base is in most cases a metallic oxide, which is capable of uniting with an acid, and of more or less completely neutralizing the distinctive properties of the latter; in some cases, however, the base is non-metallic and organic in its nature, as in the case of ammonia, morphia, quinia, strychnia, creatinine, &c.

The salts derive their generic name from common salt, now known as chloride of sodium, but till the time of Davy regarded as a compound resulting from the union of hydrochloric (or as it was then termed, *muriatic*) acid and soda. See SODIUM. Davy, however, showed that during their action upon each other, both the acid and the alkali undergo decomposition, and that while water is formed by the union of the oxygen of the alkali (NaO) and the hydrogen of the acid (HCl), the sodium of the former combines with the chlorine of the latter to form chloride of sodium (NaCl). Hence, strangely enough, the very substance from which the salts derive their name as a class, was the means of overthrowing the old idea that a salt, as a matter of necessity, must result from the union of a base with an acid. It was then proposed to divide salts into two classes—those formed by the union of a base with an oxyacid, such as nitrate of potash (KO,NO_5), formed by the union of oxide of potassium with nitric acid, sulphate of soda ($NaOSO_3$), carbonate of lime (CaO,CO_2), &c., which were termed *oxysalts;* while the other class consisted, like chloride of sodium, of a metal combined with the characteristic element (chlorine, iodine, bromine; fluorine) in a hydrogen acid or hydracid (as, for example, hydrochloric, hydriodic, hydrobromic, or hydrofluoric acid). The salts of this second class, of which chloride of potassium (KCl) and fluoride of calcium (CaF) may be quoted as examples, being constructed on the same plan or type as sea-salt, were termed *Haloid Salts* (q. v.), from the Greek word *hals*, the sea. The chlorine, iodine, bromine, or fluorine, which, in combination with a metal, forms a haloid salt, is by some writers termed a *salt-radical*.

'The great resemblance in properties between the two classes of saline compounds, the haloid and oxysalts, has very naturally led to the supposition, that both might possibly be alike constituted; and that the latter, instead of being considered compounds of an oxide and an acid, might with greater propriety be considered to contain a metal in union with a compound salt-radical, having the chemical relations of chlorine and iodine. On this supposition, sulphate and nitrate of potash will be constituted in the same manner as chloride of potassium, the compound radical replacing the simple one.

Old View.	New View.
$KO + SO_3$	$K + SO_4$
$KO + NO_5$	$K + NO_6$

Hydrated sulphuric acid will be, like hydrochloric acid, a hydride of a salt-radical, $H + SO_4$. When the latter acts upon metallic zinc, the hydrogen is simply displaced, and the metal substituted. No decomposition of water is supposed to occur, and consequently the difficulty of the old hypothesis is at an end. When the acid is poured upon a metallic oxide, the same reaction occurs as in the case of hydrochloric acid; water and a haloid salt are produced. All acids must be, in fact, hydrogen acids; and all salts haloid salts, with either simple or compound radicals.'—Fownes's *Manual of Elementary Chemistry*, 9th ed. (and compare other standard works).

This view, which is frequently termed *the binary theory* of salts, was originally suggested by Davy, but it remained for many years nothing more than (to use the words of Professor Miller) 'an elegant hypothesis,' till it was further illustrated by certain of Liebig's researches in organic chemistry, and till, in certain special cases, it received direct confirmation from the voltaic researches of Daniell and Miller, who found that when a current from two or three of Grove's cells was transmitted through fused nitrate of silver (AgO,NO_5), the latter was resolved into crystals of silver (Ag) at one pole, and NO_6 (which at once broke up into red fumes of peroxide of nitrogen and free oxygen) at the other.

But although the binary theory serves to explain in the most satisfactory way many chemical changes, as, for example, the modifications of phosphoric acid and phosphate of soda (see Miller's *Inorganic Chemistry*, 2d ed. 1860, p. 333; or Galloway's *Second Step in Chemistry*, 1864, pp. 128—130), there are many objections to it, and it will probably give place to other views regarding the constitution of salts. For a notice of these objections, we must refer to the above-mentioned works of Miller and Galloway. Some of our most eminent chemists, as, for example, the editors of Fownes's *Manual*, take a more hopeful view. According to Drs. Bence Jones and Hoffmann, 'the general application of the binary theory still presents a few difficulties. But it is very probable that the progress of discovery will ultimately lead to its universal adoption, which would greatly simplify many parts of the science.'

The salts may be arranged according to their mode of composition into:

1. *Neutral* or *Normal Salts;* 2. *Acid Salts;* and 3. *Basic Salts.* A salt is *neutral* which is composed of as many atoms or equivalents of the acid as there are of oxygen in the metallic base. If the base is a protoxide, or contains 1 atom of oxygen, 1 atom of the acid is combined with it. Sulphate of potash (KO,SO_3), nitrate of copper (CuO,NO_5), and carbonate of potash (KO,CO_2) are all neutral in their composition, each consisting of one atom of the acid in combination with one atom of a metallic protoxide. But all these salts are not neutral, if we judge of their neutrality by their exerting no action on litmus or turmeric paper, for while the first is neutral to test-paper, the second exhibits an acid, and the third an alkaline reaction; and hence the use of the term *normal*, in preference to that of *neutral*, as applied to this class, has been judiciously advocated by Miller and other chemists. If the base is a sesquioxide, three atoms of the acid combine with one atom of the base to form a neutral or normal salt: thus, the sulphates of alumina and of sesquioxide of iron are represented by the formulæ $Al_2O_3,3SO_3$ and $Fe_2O_3,3SO_3$; and as these salts not only redden litmus, but have an acid taste, they afford an additional reason for our preference to the term *normal* over *neutral* salts.

Acid Salts are generally formed by dissolving normal salts in the same kind of acid which they contain, by which means a new salt is often, but by no means always formed. Thus, if normal sulphate of potash (KO,SO_3) be dissolved in hot sulphuric acid, tablets of a new and strongly acid salt will appear as the solution cools. These crystals consist of bisulphate or acid sulphate of potash and their composition is represented by the formula $KO,HO,2SO_3$, or KO,SO_3+HO,SO_3, in which the atom of water may be regarded as acting in the character of a weak base. If a similar experiment is made of dissolving nitrate of potash in hot nitric acid, no new salt will be formed, the nitre crystallizing out unchanged. Why some acids should have the power of forming acid salts, and others should not possess the property is unknown.

In *Basic salts*, or *Sub-salts*, as they are often termed, the proportion of base predominates over that of the acid, there being two or three or more atoms of the basic oxide combined with one atom of the acid. Thus, nitric acid forms with oxide of lead not only the normal salt, PbO,NO_5, but three basic salts—viz., $2PbO,NO_5$, $3PbO,NO_5$, and $6PbO,NO_5$. Sulphuric acid forms with oxide of mercury not only the normal salt, HgO,SO_3, but the basic salt commonly known as *turpeth mineral*, and represented by the formula $3HgO,SO_3$.

There is one other class of salts requiring a brief notice—viz., the *Double Salts*. Many neutral salts containing the same acid, but different bases, may be made to combine so as to form salts of the class now under consideration. Thus, sulphate of potash and sulphate of alumina (both of which are neutral sulphates) by combining, give rise to the double salt popularly known as alum, and represented by the formula $KO,SO_3+Al_2O_3,3SO_3+24$ Aq. Similarly, double salts of silicic acid are of common occurrence. Thus, the varieties of felspar are double silicates of alumina with potash, soda, lithia, or lime, but most commonly with potash, and they may be represented by the general formula $MO,SiO_2+Al_2O_3,3SiO_2$, where MO stands for potash, soda, &c.

The salts at ordinary temperatures are solid bodies, with a strong tendency to crystallization, although a considerable number are amorphous. They may be either colorless or colored. When a colorless acid combines with a colorless base, the resulting salt does not exhibit color. A colored base combining with a colorless acid transmits its color to the resulting salts, and if a colored acid combine with the colorless base, a similar but less marked result ensues. The salts usually have a decided taste which is usually dependent on the base; the sulphites are, however, an exception to this rule, as their taste resembles that of the acid. They are variously influenced by high temperatures: some remain unchanged; while others votatilize, fuse, and either simply lose their water of crystallization, or become decomposed. Most salts are soluble in water, and some, as for example, carbonate of potash and chloride of calcium, have so strong a tendency to dissolve in that fluid, that they abstract the moisture of the atmosphere. Such salts are termed *deliquescent*. As a general rule, hot water exerts a far more powerful solvent action than cold. There are, however, some remarkable excep-

tions to this law. Thus, the solubility of common salt (chloride of sodium) is very nearly the same, whatever be the temperature of the water, and certain salts of lime are more soluble in cold than in hot water.

It has been already shown that an atom of water enters into the composition of certain salts in precisely the same way as an atom of potash or any other base. Such water is termed *basic water*, and is an integral constituent of the salt, from which it cannot be expelled by an ordinary heat. This water is quite distinct from the *water of crystallization*, which is taken up by many salts in a definite quantity, when crystallizing from water, and which is readily expelled by a gentle heat without altering the chemical properties of the salt. The crystalline form of salts which contain water of crystallization is much influenced by the proportion in which the latter occurs. Thus, green vitriol (sulphate of iron) crystallizes in two different forms and with two different proportions of water according to the temperature at which the salt separates from its solution. The number of equivalents of water of crystallization may vary from 1 to 24, which is the highest number yet observed. In order to distinguish the water of crystallization from water acting as a base, we characterize it by the symbol Aq. (from the Latin *aqua*, water). The ordinary phosphate of soda is represented by the formula $2NaO,HO,PO_5 + 24$ Aq. Many salts which contain water of crystallization (for example, sulphate or carbonate of soda) give off the whole or a part of their water of crystallization in a dry atmosphere, and crumble to powder; such salts are said to *effloresce*. Salts which contain no water of crystallization are termed *anhydrous;* of which nitre (KO,NO_5) is an example. All salts, when dissolved in water, are readily decomposed by the electric current, the base going to the negative, and the acid to the positive pole. In consequence of this result, the acid is termed the electro-negative, and the base the electro-positive constituent of the salts. When a haloid salt is similarly treated, the halogen (chlorine, &c) is separated at the positive pole, while the metal is liberated at the negative pole.

SAL'TWORT (*Salsola*), a genus of plants of the natural order *Chenopodiaceæ*, having hermaphrodite flowers, with 5-parted perianth, and a transverse appendage at the base of each of its segments, five stamens and two styles, the seed with a simple integument. The species are numerous, mostly natives of salt-marshes and sea-shores, widely diffused. One only PRICKLY S. (*S. kali*), is found in Britain. It has herbaceous prostrate, much-branched stems, awl-shaped spine-pointed leaves, and axillary solitary greenish flowers. It was formerly collected in considerable quantities on the western shores of Britain, to be burned for the sake of the soda which it thus yields. *S. sativa* is the chief Barilla (q. v.) plant of the south of Spain.

SALU'TE is a compliment paid in the Navy and Army, when a royal or other distinguished personage presents himself, when squadrons or armed bodies meet, when officers are buried, and on many other ceremonial occasions. There are several modes of saluting: firing great guns and small-arms, dipping colors, flags, and topsails, presenting arms, manning the yards, cheering, &c. A royal salute consists in the firing of 21 great guns; in the lowering by officers of their sword-points, and the dipping of the colors. A form of salute of more frequent occurrence is when a soldier 'presents arms;' or touches his cap to an officer.

SALUZZO, an episcopal city of Northern Italy, in the province of Cuneo, at the foot of the Alps. It contains a semi-Gothic cathedral built in 1480, with pillars of rare marbles, and colossal statues. Noteworthy are also the ancient civic palace, the old castle of the marquises of S. (now a prison), and a ruined abbey. Silvio Pellico was born here. Its products are grain, hemp, and wine; and its manufactures are silk fabrics and hats. Pop. of commune (1881) 15,641; of town, about 10,000.

SA'LVAGE (from Lat. *salvare*, to save) is the payment due by the owner of a ship or cargo to persons who may have been instrumental in saving it from extraordinary danger—from the sea, fire, or an enemy.

Salvage was recognized in the earliest maritime codes—as in the laws of Rhodes, Oleron, and Wisby. The law of England divides it into two classes, civil and hostile salvage. *Civil Salvage* is saving a vessel or her cargo, or part thereof, from the perils of the deep; hostile salvage recovers it from an enemy or pirate after capture. No proportion is laid down in civil salvage, as generally applicable. Each case must be decided on its own merits, the ingredients for decision being—1st, the degree of danger incurred by the salvors; 2d, the degree of peril in which the property rescued stood; 3d, the degree of skill, labor, and time evinced in the salvage; 4th, the value and nature of the property. Except where the assistance rendered has been trifling, the salvage usually ranges from a third to a half of the property saved. A royal ship is bound to aid a merchantman in distress; but it can still claim salvage. *Hostile Salvage* was fixed in 1803 at one-eighth the value of the property saved for royal ships, and one sixth for private vessels.

SALVATION ARMY is the name of a Christian organization, whose aim is to bring under the influence of the gospel the classes not reached by the ordinary home-mission agencies of the churches—the inhabitants of the lowest slums of cities, profligates, thieves, confirmed drunkards, and vagabonds. It was founded in 1865 by Mr. Booth, now called 'General' Booth, formerly a minister of the Methodist New Connection. The organization steadily grew, and in 1878 the name Salvation Army was adopted. Its members not merely fight figuratively under the Captain of Salvation, but delight in applying pseudo-military names to all their offices and actions. Thus the various local associations are called corps, and all the missionaries, male and female, are 'officers' (majors, captains, &c., as the case may be); preliminary prayer is called 'knee drill,' and devotional services are 'skirmishes,' 'engagements,' or 'field-days.' The services are highly unconventional; much use is made of processions in the streets, of banners, and of brass bands in worship. Ejaculations of applause and wavings of handkerchiefs and flags accompany the services. The doctrines are, however, those of the orthodox evangelical churches, great stress being laid on purity of heart or sanctification. The army has excited singularly keen antipathy amongst the roughest part of the population, and its members have very frequently been assaulted and maltreated, especially on occasion of processions. But they are said to have been very successful in reclaiming drunkards and criminals. In 1883, the S. A. had nearly 1000 'officers' in Britain, and had missions in the United States, in Canada, Australia, New Zealand, the Cape, and France. A biweekly paper, abounding in the military jargon of the S. A., has a circulation of 400,000. Members of the association are expected to wear a badge; and if they can, to procure a complete uniform.

SA'LVÉ REGI'NA, the first words of one of the most popular prayers in the Roman Catholic Church, addressed to the Blessed Virgin Mary. It forms part of the daily office of the Roman Breviary, and is recited at the end of 'Lauds' and of 'Complin.' But it is still more in use as a prayer of private devotion, and concludes with an earnest and tender appeal for the intercession of the Blessed Virgin with her Son, 'that we may be made worthy of the promises of Christ.'

SA'LVO is a concentrated fire from a greater or less number of pieces of artillery. Against a body of men, a salvo is generally useless, as the moral effect is greater in proportion to the area over which devastation is spread; but with fortifications, the case is otherwise. For the purpose of breaching, the simultaneous concussion of a number of cannon-balls on masonry, or even earthwork, produces a very destructive result. At Almeida, after the French had fired a few salvos of 65 guns, the castle sunk in a shapeless mass. The effect of a salvo of modern artillery, with its enormous steel shot, against iron-plated ramparts, has never yet been tried in actual war.

SAL VOLATILE, a well-known remedy for faintness, is a solution of the carbonate of ammonia, or common smelling-salts. See SALTS, SMELLING.

SA'LZBRUNN, the name of three villages, NEU, NIEDER, and OBER S., in Prussian Silesia, 37 miles south-west of Breslau; they have eight mineral springs, and much-frequented baths. Alkalo-saline water is exported. Pop. in all, 3050.

SA'LZBURG, a crown-land in the west of Austria, bounded on the west partly by Bavaria, and partly by the Tyrol. Area, 2765 sq. m.; pop. (1880) 163,566. The principal mountain-ranges are the Noric Alps, which traverse the south of S. from west to east, and rise in the Grossglockner to the height of 12,360 feet; and branches of the Rhætian Alps, which separate the Tyrol from S., and ramify throughout the middle districts of the latter, rising in the Ewiger Schneeberg to 9580 feet. Snow-fields and glaciers occur in the more elevated regions. The chief river, the Salza, drains the greater part of the crown-land, flows first east, then north, and is 147 miles in length. The climate is cold and variable, but healthy, and although, of the whole area, 2000 sq. m. are capable of bearing crops, this crown-land is inferior to most of the provinces of the monarchy in quantity and value of products. The rearing of cattle and horses is an important branch of industry. Salt is obtained in large quantities, especially at Halle (q. v.). Salzburg is the capital.

SALZBURG (anc. *Juvavia*), perhaps the most charmingly situated town in Germany, is the capital of the Austrian crown-land of the same name, and stands on both banks, but chiefly on the left bank of the Salza, 190 miles west-south-west of Vienna by railway. Here the river, banked on both sides by precipitous crags, rushes through what seems to be a natural gateway, and flows northward to its junction with the Inn.

The picturesque situation of the city is thus described by Wilkie: 'It is Edinburgh Castle and the Old Town brought within the cliffs of the Trosachs, and watered by a river like the Tay.' The heights on either bank of the Salza are crowned with edifices. That on the left, called the Mönchsberg, is surmounted

by the castle, called Hohen-Salzburg, an irregular feudal citadel of the 11th c., and, during the middle ages, the residence of the archbishops of S., who combined the dignity of princes of the German empire with their ecclesiastical rank. The castle itself is now dismantled, but still serves as a barrack. A statue of Mozart (q. v.) adorns one of the squares. Opposite Mönchsberg is the Capuzinerberg, with a convent. The cathedral, a large and beautiful Italian edifice, was built in the early part of the 17th century. The architectural taste of the archbishops has adorned the city with many beautiful edifices, chiefly in the Italian style. The city is surrounded by walls, here and there dismantled, and the bastions are for the most part in a state of decay. The city is the seat of an archbishop, and contains numerous libraries, museums, and educational and other institutions, among which is an upper gymnasium, and the *Mozarteum*. It carries on manufactures to some extent, is in communication with Vienna, Munich, and Innspruck by railway, and has a considerable transit-trade. Pop. (1880) 24,952.

SALZKA'MMERGUT, called also the *Austrian Switzerland*, one of the most picturesque districts of Europe, forms the south-west angle of the crown-land of Austria ob der Enns, between the crown-lands of Salzburg on the west, and Styria on the east. Area 249 sq. m.; population, 18,000, of whom 6500 are Protestants. The scenery combines in rare beauty the usual features of valley, mountain, and lake. The vales are clothed with a rich verdure, and are studded with clumps of fruit and forest trees; the mountains are covered with beeches and oaks; higher up with pines and larches, and in some instances are topped with everlasting snow. The highest peak, Grosse Priel, reaches an altitude of 7931 feet. But the district derives its reputation for beauty chiefly from its lakes, the largest and most famous of which are the Hallstadt and the Traun, or Gmunden lakes. They are bordered with lofty mountains, which rise sheer from the surface of the water; and their pit-like character, and the strong light and shade thrown on them from the mountains, combine to render the scenery, of which they form the center, unusually sublime. The Hallstadt and Traun lakes are connected, and indeed formed by the river Traun. The district of S. derives its name from the salt which is obtained in enormous quantities from its springs and mines. Salt being a government monopoly in Austria, the works are under the management of the *Kammer*, or exchequer. From 6000 to 7000 of the inhabitants are employed in the salt-works, and the amount annually obtained is near 50,000 tons. The chief seats of the salt-works are Ischl (q. v.) and Hallstadt. Little or no agriculture is carried on in the S., and the inhabitants not engaged in the main industry of the district are engaged in cattle-breeding and in the timber trade.

SA'LZWEDEL, a small manufacturing town of Prussian Saxony, 54 miles north-north-west of Magdeburg, on the Jeetze. It carries on sugar-refining, and manufactures of linen, woollen, and cotton fabrics. Pop. (1880) 8780.

SAMANI AND DILEMI were two dynasties which divided between them the kingdom of Persia towards the beginning of the 10th century. They both rose to power through the favor of the califs, but they speedily threw off the yoke. The Dilemi, divided into two branches, exercised sovereign authority in Kerman, Irak, Fars, Khuzistan, and Laristan, always acknowledging their nominal dependence on the calif; and during the whole period of their rule, one of the southern branch of this family was vested with the dignity of *emir-ulomra*, or vizier, and managed the affairs of the califate. Several of the Dilemi were able and wise rulers, as the remains of their works of irrigation and other structures amply testify; but Mahmud of Ghizni put an end to the rule of the northern branch in 1029, and the Seljuks subjugated the southern one in 1056, by the capture of Bagdad, their last stronghold. Their more powerful rivals, the *Samani*, had obtained from the calif the government of Transoxiana in 874 A.D.; and to this, Ismail, the most celebrated prince of the family, speedily added Khaurezm, Balkh, Khorassan, Seistan, and many portions of Northern Turkestan. Rebellions of provincial governors distracted the Samanide monarchy towards the end of the 10th c., and in 999 A.D. their dominions north of Persia were taken possession of by the khan of Kashgar, the Persian provinces being added by Mahmud of Ghizni to his dominions.

SAMAR, one of the Philippine Islands (q. v.).

SAMARA', a frontier government of Russia, bounded on the E. by the Kirghiz Steppes, and on the W. by the governments of Saratov, Simbirsk, and Kazan. Area, 64,953 sq. m.; pop. (1880) 2,143,490. It was erected into a government by ukase of Dec. 1850, and was formed out of portions of the governments of Simbirsk, Orenburg, and Saratov. The Volga, which forms the western boundary, and its affluent, the Samara, are the chief rivers. The country is very fertile, and agriculture and fishing are among the chief employments of the inhabitants. Only a comparatively small portion of the country is colonized. Chief town Samara (q. v.).

SAMARA, capital of the Russian government of the same name, on the left bank of the Volga, at the junction of that river with the Samara. It is the chief grain-market on the Volga, and it contains numerous store-houses, especially for grain. A good trade in salt, fish, caviare, and tallow is also carried on. From S. comes a great number of lambs' skins, which are famous for their fineness. Pop. (1880) 51,947.

SAMARA'NG, an important seaport on the north of Java, 385 miles (by steamboat course), east of Batavia, in 6° 57′ 20″ S. lat., and 110° 26′ 30″ E. long., is the capital of the Residency, and the point to which the produce of Middle Java is brought for exportation to Europe. Pop. 50,000. The city lies on the right bank of the river Samarang. A railway to the Vorstenlanden (Princes' Lands), 126 miles long, was completed in 1874. The Chinese, Malays, and Arabians have their own captains, and quarters of small, dark, dirty houses. The Europeans dwell partly along the sea-shore, but chiefly on the left of the river, by the shady road to Bodjong, the resident's house, which is two miles from the city. The Protestants and Roman Catholics have each a church, orphan-house, and school. There are 3 public and 12 private schools, an excellent hospital for 550 patients, and other charitable institutions.

Only small vessels can enter the river. The roadstead is exposed to the west wind, and is dangerous during the rainy season. Besides the usual trades, the natives work in gold, silver, copper, and tin. Coffee, rice, sugar, tobacco, and indigo are the chief exports, an agent of the Netherlands Trading Company (q. v.) being established at S. to attend to the government trade. In 1874, the pop. of the residency of S. amounted to 1,319,978 souls, 3050 being European, and 15,185 Chinese.

SAMA'RIA (Heb. *Shomerôn*, Chald. *Shamrayin*, Septuagint, *Samareia, Semeron*, &c.), anciently a city of Palestine, the chief seat of the Ephraimitic Baal-worship, and, from the seventh year of Omri's reign, the capital of the kingdom of Israel. It was beautifully situated on a hill about six miles north-west of Shechem, and probably derived its name (which may be interpreted 'pertaining to a watch' or a 'watch-mountain') from the position of the hill, which rises from the center of a wide valley, and commands an extensive prospec ; but an eponymous etymology is adopted by the writer of 1st Kings, who says (chap. xvi. verse 24): 'And he [Omri] bought the hill Samaria of Shemer for two talents of silver, and built on the hill, and called the name of the city which he built, after the name of Shemer, owner of the hill, Samaria.' The date assigned to Omri's purchase is 925 B.C., from which time S. became the seat of government, which had been formerly at Thirsa. It was twice besieged by the Syrians (901 B.C., and 892 B.C), under Ahab and Joram, on both occasions unsuccessfully; but in 721 (720) B.C., it was stormed by Shalmaneser, king of Assyria, after a three years' siege.

Its inhabitants, together with those of all the other 'cities of Samaria' (which had become the general name for the country itself in which the city stood), i. e., the kingdom of Israel—or the 'ten tribes'—were then carried off into a captivity from which they never returned. Their place was supplied, after a time, by colonists, planted there by Shalmaneser and Esarhaddon, from Babylon, Cuthah, Ava, Hamath, and Sepharvaim (according to 2d Kings, chap. xvii. verse 24; Media and Persia, Josephus's *Antiquities*, x. 9, 7), who constituted the original body of the people subsequently known as Samaritans, but whose bulk was gradually increased by accessions of renegade Jews and others. The question has been much, and on the whole unprofitably, discussed, whether these so-called 'Samaritans' were a mixed race of remanent Israelites and heathen Assyrians, or whether they were exclusively the latter. The mere language of Scripture, strictly construed, seems to favor the second of these views, unless the term 'cities' of 2d Kings, xvii. 24, is intended to imply that the ancient inhabitants dwelt in the open country. On the other hand, we find, apart from the other reasons against so unparalleled a wholesale deportation, Israelitish inhabitants under Hezekiah and Josiah, both in Ephraim and Manasseh. Modern authorities therefore assume that they were, to a certain extent, what they always insisted on being, Israelites—(not Jews), i. e., a people largely intermixed with Israelitish elements, that, during the exile, had adopted the worship of Jehovah. The returning Jews, however, would not recognize their claims to the participation in the national *cultus* and temple, and a bitter antagonism sprang up between the two nationalities.

In 409 B.C., a rival temple was erected on Mount Gerizim, and a rival priesthood and ritual organized, and henceforth the breach, for some periods at least, became apparently irreparable—'the Jews had no dealings with the Samaritans,' and *vice versâ*. At other periods, however, a more friendly intercourse seems to have taken place between them. The rabbinical laws respecting the 'Kushites' (Cuthim), as they were called by the later Jews, are

therefore strangely contradictory, and their discrepancies can only be explained partly by the ever-shifting phases of their mutual relations, and partly by the modifications brought about in the Samaritan creed itself. The later history of the city of S. is somewhat checkered. It was captured by Alexander the Great, when the 'Samaritan' inhabitants were driven out, and their place supplied by Syro-Macedonians. It was again taken (109 B.C.) by John Hyrcanus, who completely destroyed it. Soon rebuilt, it remained for the next 50 years in possession of the Jews; but Pompey, in his victorious march, restored it to the descendants of the expelled Samaritans, who had settled in the neighborhood, and it was refortified by Gabinius. Herod the Great rebuilt it with considerable splendor, and called it Sebaste, in honor of the Emperor Augustus, from whom he had received it as a present. In the 3d c., it became a Roman colony and an episcopal see. Its prosperity perished with the Mohammedan conquest of Palestine; and at present, it is only a small village called Sebustieh, an Arab corruption of Sebaste, but contains a few relics of its former greatness. 'Samaritans,' as a religious sect, still exist at Nablus (anc. Shechem), as they have existed in the district uninterruptedly through all the vicissitudes of war and conquest from the time of Christ. Their present creed and form of worship agree in many particulars with that of the so-called 'rabbinical' Jews, although the Samaritans pretend utterly to reject the 'Traditions.' They alone, however, have retained the paschal sacrifice of a lamb.

The language of the ancient Samaritans is a Hebræo-Aramaic dialect, but contains a number of non-Semitic (Cuthæan) words. It only survives in a few fragments of ancient literature, a translation of the Pentateuch, and some liturgical pieces. The present inhabitants speak Arabic.—See Dr. Robinson's *Biblical Researches*, Raumer's *Palästina*, and Dean Stanley's *Sinai and Palestine*, &c.

SAMA'RITAN PENTATEUCH, a recension of the commonly received Hebrew text of the Mosaic law, in use with the Samaritans, and their only canonical book of the Old Testament. Some vague allusions in some of the Church Fathers (Origen, Jerome, Eusebius), and one or two more distinct, but less generally known Talmudical utterances respecting this recension, were all the information available up to the early part of the 17th c. (1616), when Pietro della Valle acquired a complete codex from the Samaritans in Damascus. Since then, the number of manuscripts of the Samaritan Pentateuch, with and without translations (in Arabic, has considerably increased in European libraries; and fragments, consisting of special books or chapters, are of the most frequent occurrence. In fact, writing portions of Samaritan Pentateuch on the oldest of skins, would, in the face of the great demand for the article on the part of ignorant European, especially English, travelers, appear to be a favorite and lucrative pastime, if not an established trade and business, among the modern Samaritans.

These MSS. are written in the Samaritan character, a kind of ancient Hebrew writing, probably in use before, and partly after the Babylonish exile, and vary in size from octavo to folio, the writing being proportionately smaller or larger. Their material is vellum, or cotton paper, and the ink used is black, with the exception of the Nablûs MS., which is written in gold. There are neither vowels, accents, nor diacritical points, the single words are divided from each other by dots. None of the MSS. that have reached Europe are older than the 10th century. The Samaritan Pentateuch was first edited by J. Morinus in the Paris *Polyglott* (pt. iv. 1632) from *one* codex (whence it found its way into Walton), and was last re-edited, written in the square Hebrew characters, by B. Blayney, Oxford, 1790. The first publication of this strange document, and principally the *Exercitationes Ecclesiasticæ*, with which J. Morinus accompanied it, mark a certain epoch in modern biblical investigation; for, incredible as it now appears, it was placed by Morinus and his followers far above the received Hebrew text, which was said to have been corrupted from it. As reasons for this, were adduced its supposed superior 'lucidity and harmony,' and its agreement with the Septuagint in many places. This opinion, which could only have been entertained by men devoid of knowledge, was zealously cherished, and fiercely combated for exactly 200 years, when the first proper and scientific investigation (by Gesenius) set it at rest, once for all, among the learned world at least. This absurd notion chiefly owed its popularity to the anti-Jewish as well as anti-Protestant tendency of its supporters, to whom every attack against the received form of the text—that text upon which alone the Reformers professed to take their stand, was an argument in favor of the Roman Catholic dogma as to the 'Rule of Faith' (q. v.). This boasted superiority *en bloc*, gradually dwindled down to two or three passages, in which the Samaritan reading seemed preferable, and even these have now been disposed of in favor of the authorized Masoretic text.

The variants, which Gesenius was the first to arrange systematically, present simply the ordinary aspect of partly conscious, partly unconscious corruptions. They arose, for the greatest part, from an imperfect knowledge of the first elements of grammar and exegesis. Others owe their existence to a studied design of conforming certain passages to the Samaritan mode of thought, speech, and faith, more especially to show that Mount Gerizim was the spot chosen by Jehovah for his temple. There are, however, only two essential alterations respecting the Mosaic ordinances themselves to be found, one, Exod. xiii. 7, where the Samaritan Pentateuch has 'six days shalt thou eat unleavened bread,' instead of 'seven;' and Deut. xxiii. 17, where our 'shall be no' is altered into 'shall not live.' A chronological peculiarity deserves special mention—viz., that no one in the antediluvian times begets his first son in the Samaritan Pentateuch after the age of 150, either the father's or the son's age being altered in proportion; after the Deluge, however, the opposite method is followed of adding 50 or 100 years to the father's years before the begetting of a son. We will only further add that anthropomorphisms, as well as anthropopathisms, are most carefully expunged, and that in Deut. xxvii. 4, Gerizim is wilfully substituted for Ebal.

It is, in the absence of a critical edition, exceedingly difficult to do more than speculate on the age and origin of the Samaritan Pentateuch, and opinions remain indeed widely divergent. The principal opinions on the subject are, briefly, either that it came into the hands of the Samaritans as a natural inheritance from the Jewish people, whom they succeeded at the time of the Babylonish exile; or that it was brought to them by Manasse (Jos. *Ant.* xi. 8, s. 2, 4), when the Samaritan sanctuary on Mount Gerizim was founded; or, again, that the Israelitish priest sent by the king of Assyria to instruct the new settlers in the religion of the country, brought it with him. Of other more or less isolated opinions, only that one deserves further notice, that it was a late and faulty recension, into which glosses from the LXX. (Septuagint) were received. This agreement between the LXX. and the Samaritan Pentateuch, to which we have already alluded, has likewise given rise to many speculations and suggestions. The foremost of these are, that the LXX. have translated from the Samaritan Pentateuch; that mutual interpolations have taken place; that both versions were formed from Hebrew codices, differing among themselves, as well as from the authorized recension; and that many wilful corruptions have been superadded at a later time; finally, that the Samaritan has been altered from the LXX. There is also a translation of the Samaritan Pentateuch (which is Hebrew) into the Samaritan idiom; it is ascribed by the Samaritans to their high-priest, Nathaniel, who died 20 years before Christ. It was probably a kind of popular version, like the Targums (q. v.), and was composed, very likely, shortly before the destruction of the second temple. The translation is done in the most slavish and incompetent manner. Another Arabic version is due to Abu Said, in Egypt (1070), based on Saadiah's translation; and to this Samaritan-Arabic translation, a Syrian, Abu Barachat, wrote, in 1208, a commentary, which is sometimes erroneously taken to be an independent Syriac version of the Samaritan Pentateuch. Among the principal modern writers on the Samaritan Pentateuch are Gesenius, Kirchheim, and Deutsch.

SAMARKA'ND was in the 14th c. the capital of the great Tartar empire of Timur. It has since remained the center of Mohammedan learning in Central Asia. It was till 1868 the second city of the khanate of Bokhara, and since that period annexed to the dominions of the Czar, it has become one of the chief towns of Russian Turkestan. It is in lat. 40° 2′ N., and long 67° 3′ E., 4 English miles south of the Zer-Afshan (a river which 'loses itself in the sands'), and 145 miles nearly east-by-north from Bokhara. It is situated at the foot of Mount Chobanata, in a plain of exuberant fertility; and when seen from a distance, its glittering minarets, lofty domes, and prominent edifices and ruins, relieved by the brilliant green of the closely-planted gardens interspersed within the walls, present an imposing effect. The river for centuries has been changing its course, and S. has followed it—so that it consists of a 'new city,' and the ruins of those which preceded it. The 'new city' is surrounded with walls, pierced with six gates, and is filled with narrow streets and lanes, which have, however, undergone many improvements since the Russian occupation. The population, which in the 14th c. exceeded 100,000, has dwindled to 20,000. The inhabitants consist chiefly of Tajiks and Usbeks. They are chiefly employed in the manufacture of silk, wool, and leather. The old or 'ruined city' is the portion most interesting to Europeans, as the capital of that mighty conqueror who wielded the scepter of Asia from China to the Hellespont. Many of the ruins belong to this epoch, among which are the Hazreti Shah Zinde, at one time supposed to have been a summer palace of Timur, but now shown to have consisted of tombs and chapels only.

In the center of the city, separated from each other by a wide open space, stand three medresses, or sacred colleges. Each consists of a large quadrangular court, surrounded by a range of two-

storied buildings, with chambers occupied by teachers and pupils. One of the objects of interest in S. is the palace of the Emirs of Bokhara, built within the citadel, where, before the Russian conquest, they were in the habit of spending the summer months with their harem suite. In one of the courts is the famous Kuktash, or green-stone, which served as Timur's throne. The palace has now been converted by the Russians into an hospital. S. was the ancient *Maracanda*, the capital of Sogdiana. It was seized by the Arabs, 707 A.D., and from this time belonged either to the calif ate or to some of the dynasties which were offshoots from it, till 1219, when it was taken by Genghiz Khan. In 1359 it was captured by Timur, and ten years afterwards became the capital of his empire. It remained the chief town of Turkestan till 1468, when it declined in importance with the rise of the Usbeks. It retained, however, its position as the chief seat of Mohammedan learning in Asia. Until recently it had been visited by only four Europeans—in 1404 by the Spaniard Clavijo, in 1841 by Lehmann and Chanykow, and in 1863 by Vambery. But in May 1868, the gates of S. were opened to the Russians (see BOKHARA), and they have since retained possession of the city. The inhabitants have manifested less antipathy to the rule of the infidel than might have been expected, from the reputation of S. as a seat of Mohammedan fanaticism. The Jews have prospered by the encouragement given to trade; and the Tajik population have shown, as in the other cities of Turkestan annexed by Russia, goodwill towards their conquerors, and a desire to adopt European ideas.—See Vambery's *Travels in Central Asia* (Lond. 1864), and paper on 'Ruins of Samarkand,' by Professor Fedchenko, in *Proceedings of Royal Geographical Society*, December 1871.

S'AMAVEDA is the name of one of the four Vedas. See VEDA.

SAMBAS. See PONTIANAK.

SAMBOO, or SAMBUR. See RUSA.

SA'MBOR, NEW, a town of the Austrian empire, in the province of East Galicia. It is a thriving and well-built town, with manufactures of linens and extensive salt-works. Pop. 12,000.

SAMMATIYA is one of the four divisions of the *Vaidhâshika* system of Buddhism; its reputed founder was *Upâli*, a disciple of *the* Buddha, S'âkyamuni.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860)

SA'MNITES, an ancient Italian people of Sabine origin, who occupied an extensive and mountainous region in the interior of Southern Italy. They were surrounded on the north by the Peligni, Marsi, and Marrucini; on the west and south-west by the Latins, Volscians, Sidicini, and Campanians; on the south by the Lucanians; and on the east by the Apulians and Frentani. The S. were divided into four nations: 1. The *Caraceni* in the north, whose capital was Aufidena. 2. The *Pentri* in the center, whose capital was Bovianum, and who constituted the most powerful nation of the Samnite stock. 3. The *Caudini*, in the south-west. 4. The Hirpini in the south, whose capital was Beneventum. For an account of their origin, ethnological affinities, and history, see ROME, HISTORY OF.

SAMO'AN ISLANDS. See NAVIGATORS' ISLANDS.

SA'MOS (Mod. Gr. *Samo;* Turk. *Susam Adassi*), an island in the Ægean Sea, is situated about a mile off the coast of Asia Minor, in the Bay of Scalanova, about 45 miles south-south-west of Smyrna. Its length is 30 miles; its mean breadth about 8 miles. A range of mountains, which may be regarded as an insular continuation of Mount Mycale, on the mainland, runs through the whole island, whence its name—Samos, being an old Greek word for any height in the neighborhood of the sea. The highest peak, Mount Kerkis (anc. *Cerceteus*), reaches an elevation of 4725 feet. S. is still, as in ancient times, well wooded. Between its eastern extremity and the mainland lies the narrow channel of Mycale (called by the Turks the *Little Boghaz*), where, in 479 B.C., the Persians were totally defeated by the Greeks under the Spartan Leotychides. Between the island and Nicaria (anc. *Icaria*), on the west is the *Great Boghaz*, from 3 to 8 miles broad, and much frequented by vessels sailing from the Dardanelles to Syria and Egypt. S. is well watered and very fertile, exporting considerable quantities of corn, grapes, wine, oil, valonia, &c.; its mountains furnish quarries of marble. The present capital, called Khora ('the town'), is situated on the south side of the island, at the base of a hill (about 2 miles from the sea), on which ruins of the ancient acropolis (*Astypalaia*) are still visible. On the north coast lies Vathy or Bathy, which derives its name from its deep (Gr. *bathys*) harbor. The pop. of the island was 35,878 in 1877.

Anciently, S. was one of the most famous isles of the Ægean. At a very remote period, it was a powerful member of the Ionic Confederacy, and (according to Thucydides) its inhabitants were the first, after the Corinthians, who turned their attention to naval affairs. Their energy and resources were soon seen in the numerous colonies which they established in Thrace, Cilicia, Crete, Italy, and Sicily. But the celebrity of the island reached its acme under Polycrates (q. v.) 532 B.C., in whose time it was mistress of the archipelago. Subsequently, it passed under the power of the Persians, became free again after the battle of Mycale, stood by Athens during the Peloponnesian War, and after several vicissitudes, became a portion of the Roman province of Asia, 84 B.C. Its later history is but the melancholy record of continuous decay, nor till the rise of the modern Greeks against the Turks did it ever again acquire distinction. When the war of independence broke out none were more ardent and devoted patriots than the Samians; and deep was their disappointment when, at the close of the sharp and brilliant struggle, European policy assigned them to their former masters. They are not, however, incorporated, so to speak, with the Turkish empire, but are semi-independent, being governed by a Fanariot Greek, who bears the title of Prince of Samos, and pays tribute to the Porte.

SAMOTHRA'CE, or THRACIAN SAMOS (Mod. Gr. *Samothraki*), an island in the north of the Ægean, north-east of Lemnos (*Stalimene*). It is a rugged and mountainous mass, about 8 miles long by 6 miles broad, towering to the height of 5240 feet, and forming the loftiest land in the whole Greek archipelago. The traveler on the plains of Troy can see its white summit shining afar in the north-west over the intervening hills of Imbros—a proof that Homer drew from personal observation when he made Poseidon watch from his Samothracian throne the events of the war. The island has not a single good port, whence Pliny calls it 'the most harborless of all isles' (*importuosissima omnium*), but there are some good anchorages. Its history is quite unimportant, and all the interest attaching to it is derived from its connection with the mysterious and gloomy worship of the Cabeiri (q. v). Pop. 5000, almost all Greeks.

SAMOYE'DES, the name of a race widely spread over the extreme north of Europe and Asia, and forming one of the four families of the great Altaian stock. Originally, the S. inhabited the whole of the vast Siberian plain from the Altai to the Arctic Sea, but for many hundred years Mongolian peoples have forced themselves in among them. Their chief seat at present is the region lying between the Obi and the Yenisei. They have been very little influenced by Russian civilization or Christianity, retain in great measure their old manners and customs, and live by fishing, or the rearing of reindeer. The most important researches concerning their ethnographic and linguistic relations have been made by Castren (q. v.).

SA'MPHIRE (*Crithmum*), a genus of plants of the natural order *Umbelliferæ;* having compound umbels, and an oblong fruit, rather flattened at the back, with five winged ridges, and many *vittae* spread all over the seed. COMMON S. (*C. maritimum*) is a perennial, native of Europe, growing chiefly on rocky cliffs near the sea. It is common in the south of England, but is rare in Scotland. Its radical leaves are triternate; those of the stem have lanceolate and fleshy leaflets. The stem is about 1½ feet high, the flowers yellow. S. makes one of the best of pickles, and is also used in salads. It has a piquant, aromatic taste. It is generally gathered where it grows wild, but is sometimes very successfully cultivated in beds of sand, rich earth, and rubbish, occasionally supplied with a little salt.—*Inula Crithmoides*, a perennial plant, allied to Elecampane (q. v.), and of the natural order *Compositæ*, a native of the sea-coasts of England, is used in the same way as S., and is often called GOLDEN SAMPHIRE.—The young shoots of *Salicornia herbacea* (see GLASSWORT) are also substituted for it as a pickle, and sold under the name of MARSH SAMPHIRE.

SA'MSOE, a small island belonging to the kingdom of Denmark, is situated in the northern entrance to the Great Belt, between Zealand and Jutland. Area, 42 sq. m.; pop. 5875. There are no towns, and the inhabitants owe the considerable comforts they enjoy entirely to the unusual fertility of their island.

SAMSON (Heb. *Shimshon*, compare *Shemesh*, sun), the son of Manoah, of the tribe of Dan, for 20 years 'Judge' over the south-western tribes of Israel—perhaps only of Dan. It would appear, however, as if this title had only been bestowed upon him as a kind of reward for his daring and extraordinary exploits against the neighboring Philistines, who at his birth held a great part of Palestine tributary. There is in the whole account of his deeds no sign of any superior authority vested in him. His history bears altogether more the general character of a popular tale, or saga, than that of a real historical account. His whole life is surrounded by a marvelous halo from his birth to his death. To his mother, long barren (cf. Gen. xviii. 10, 1 Sam. i. 2, &c., Luke i. 7, &c.), there appeared an angel, who promised her a son on the condition that he should become a Nazarite. He is born: his mother abstaining from all strong drink and unclean food before his birth. His hair, left to grow to its full length, in accordance with the Nazarite rules, endows him with a supernatural strength, which

apparently increases with each manifestation. His first feat is his tearing a lion, when on his way to ask a Philistine woman in marriage. Returning the same road, to celebrate his wedding, he finds a swarm of bees in the lion's carcass, and forthwith propounds a riddle, which, through his wife's treachery, costs 30 Philistines their lives. We need not here recapitulate the many similar exploits composing his well-known career, which he ended by pulling down the house upon himself and his enemies the Philistines, so that 'the dead which he slew at his death were more than they which he slew in his life.'

It has been matter of most contradictory speculations, how far his existence is to be taken as a reality, or, in other words, what substratum of historical truth there may be in this supposed circle of popular legends, artistically rounded off, in the four chapters of Judges (xiii.—xvi.) which treat of him. To begin with, difficulties are raised respecting the time in which he is said to have lived. While some hold him to be a contemporary of Eli and Samuel, others see in Eli his successor; others again suppose an interregnum between him and Eli. Next comes the question how he, a Nazarite, could eat honey out of the lion's carcass—a fact, by the way, entirely ignored by Josephus. The miraculous deeds he performed have taxed the ingenuity of many commentators, and the text has been twisted and turned in all directions, to explain 'rationally' his slaying those prodigious numbers single-handed; his carrying the gates of Gaza, in one night, a distance of about 50 miles, the probable distance from Hebron to Gaza, and some have indeed assumed that he did not carry them there all at once, but piecemeal. But the principal difficulty seemed to lie in the well that sprung out of the jaw-bone, and the early Jewish interpreters (Targum, Josephus) take the word Lehi to be the name of a place; a notion countenanced, so far, by Gesenius, as he allows that it might have been 'derived etymologically from this myth.'

The close parallel between the deeds of S. and those of Hercules has caused some to identify the two heroes; yet whose might be the priority, is matter of contest between the different schools of biblical criticism. It is not necessary to enlarge upon this point. It is well known how Hercules slays the Nemean lion; another formidable lion at the Mount of Cithæron; how he catches the stag of Diana and the Cretan bull; how he is kept prisoner in Egypt; how he comes to his death by the agency of a woman; not to mention the extraordinary circumstances of his birth, and the like. See HERCULES. This once popular notion, however, of seeing nothing more in S. than the Tyrian sun-god Hercules (Baal-Shemesh, 'Lord of the Sun;' Baal-Chamon, 'Lord of the Heat,' &c.), and the attempt to explain the various 'myths' accordingly, is not countenanced by most modern critics. However embellished and overladen with legends, they say, the account in the Book of Judges may be, there is hardly any doubt as to the real existence of a man S., of extraordinary prowess, who turned his whole might and strength against the hereditary enemies of his people, whose land bordered on that of the tribe to which he belonged; who, with all his blemishes, was possessed by a noble, self-sacrificing patriotism, and never for one moment forgot the chief end and aim of his life, viz., to free his people from foreign yoke. Altogether, he is too human ever to have been an allegory or a parable, the moral of which would, indeed, hardly be perceptible, or to have, as some have conjectured, 'been intended through his whole career to be a living mockery of the Philistine Hercules.'

SAMUEL (Heb. *Shemuel*, heard by or asked from God), the last *Shofet* or Judge of Israel, the 'first of prophets,' the founder of the schools of prophets and of the monarchy in Israel. He was the son of Elkanah and Hannah, a woman of no ordinary gifts, and almost a Nazarite herself, who dedicated the long yearned-for child to the Lord even before his birth. Elkanah was of Levitic descent, living, however, not among his own tribe, but in Ephraim. S., brought up in the sanctuary at Shiloh, under the eyes of Eli, there received his first prophetic call, and from that time forth, his prophetic mission was decided. For about twenty years from the death of Eli and his sons, we hear nothing of Samuel. The first public manifestation of his assumption of the office of judge, is his convoking an assembly at Mizpeh, and routing, at the head of the people, the Philistines—his first and probably his only military achievement. His occupations generally were of a more peaceful character. Dwelling in his own native city of Ramah, where he had erected an altar, he annually went 'on circuit' to the three principal sanctuaries west of the Jordan —Bethel, Gilgal, and Mizpeh, there to instruct and judge the people, and break them from their idolatrous habits, to which they were wont to yield, in imitation of the peoples around them. For the better carrying out of this purpose, he organized special schools of teachers and prophets. These seemed to have formed special colonies (Naboth, Bethel, Gilgal, Jericho), and to have moved about in large numbers. These fraternities were destined to take an important place in the commonwealth, and to exercise the greatest possible influence upon the internal as well as the external affairs of the state, while at the same time they were the teachers of the people, expounding and developing the Mosaic law, and keeping the sacred traditions alive within the houses and hearts of Israel.

The peace S. had restored—for during his lifetime those harassing raids from the neighboring tribes had entirely ceased—and the happy use he made of it by consolidating the religious institutions and the internal power and union of the people, must have impressed the latter with the advantage of being ruled by a firm and capable head and hand. It would have been easy enough for S. to have got himself elected king, of Israel, but the establishment of a dynasty appeared to him utterly contrary to the theocratic character of the law. When, however, his two sons, Joel and Abiah, whom he had installed provisional or supplementary judges, 'turned aside after lucre, and perverted judgment,' and the complaints of the people were loud about them, S., was pressed by its representatives, who foresaw a time of terrible anarchy and lawlessness at his approaching demise, and he was obliged to yield to the general wish of installing a king to judge them 'like all the nations.' See JEWS and SAUL. The further events of S.'s life, as connected with Saul, and subsequently with David, are well known, and will be found indicated briefly under those two heads. As to his character, notwithstanding the reproaches that have been heaped upon him, we cannot but see in him one of the wisest, most sagacious, unselfish, patriotic heroes. He was, doubtless, severe and energetic in the extreme, following the path that seemed to him indicated by Jehovah as the only one leading to the common welfare. Gifted with both the spiritual and worldly supreme power over the people, at a time when they had neither political unity, nor laws, nor a *cultus*, he succeeded in rousing the public spirit, in uniting all the tribes under one banner, and in shaking off the Philistine yoke.

He routed idolatry, and raised by the institution of prophetic schools, the Mosaic religion to the highest eminence, while they at the same time formed a healthy counterpoise to priestcraft. That on finding Saul negligent to certain dicta of the law, for the protection of which alone he had been elected, he casts aside all personal love and fear, and for the sake of saving the country, and keeping its constitutions intact, chooses another more worthy head for the commonwealth, is not more than could be expected from this most zealous champion for Jehovah's commands. The people themselves gave him the most honorable testimony for his uprightness and justice, and later ages placed him side by side with Moses.

S. seems, after having anointed David, to have retired from public action, and to have lived in comparative seclusion at Ramah—there is, at least, no further mention of him until his death. The time of his life and the period of his judgeship are not given. It may be presumed that he died not long before Saul. If the latter ruled for twenty years, it may well be that they governed together, as Josephus has it (*Ant.* vi. 14. 9), for eighteen years; his age, however, is not easily calculated, and the opinions about it vary between sixty and ninety years. He was buried at Ramah, and his tomb is still shown at Nebi Samwil, although according to Jerome, his remains were removed under the Emperor Arcadius, to Thrace. All Israel mourned him as they had mourned none since Moses. For his apparition at En-Dor, &c., see NECROMANCY.

SAMUEL (SHEMUEL), BOOKS OF, originally formed one work, but were by the LXX. and Vulg. (followed by the recent Hebrew editions since Bomberg) and the Authorized Version, divided into two books, the first closing with the death of Saul. The name they bear is derived from Samuel, as the principal figure in them. He not only stood at the head of the commonwealth at the period they treat of in a spiritual and worldly capacity, but also anointed Saul and David, and exercised an important influence upon their rule. Their contents beginning with the high-priesthood of Eli, the narrative concludes with the death of David, and thus three principal periods are noticeable—1. The restoration of the theocracy, of which Samuel assumes the leadership (I. i.—xii.); 2. The history of Saul's kingship till his death (I. xiii.—xxxi.); and 3. David's reign (II.).

The plan of the whole work is not, as has been stated, to represent one king as he ought not to be—viz., Saul, contrasted by a king after the heart of God, David; but simply to draw the development of the theocracy from the end of the period of Judges to the end of David's reign, its humiliation and its glory under Samuel and David, whose history is, to a certain extent, told with biographical minuteness, on account of their being the divinely-chosen vessels for this great work of the restoration. As to the composition and unity of the books, it has been the prevailing opinion of scholars to see in them not a loose compilation from a number of stray sources, but a consecutive narrative drawn upon ancient and authentic documents. The character of the narrative itself, occasionally dwelling at large upon biographical episodes,

occasionally assuming the brevity of a mere chronicle, and at times repeating itself at length, is quite in accordance with ancient Semitic historiography.

It has been supposed by some that the books of Samuel were composed by the same hand that wrote the books of Kings, but they belong to a much earlier period. The author appears to have lived after the separation of the kingdoms, but long before the Exile, the language being remarkably pure, and quite free from late forms and Chaldaisms. In all probability, the author was a prophet of the time of Solomon. The Talmudical notion of Samuel's authorship has been rejected by the critics, as inconsistent with the contents and circumstances of the book. There are glosses in the book due to later hands. Of sources, we only find the 'Book of Jashar' mentioned in the work. The author, if he did not use real annals of the empire, which were only first commenced under Solomon, had, at all events, a certain number of prophetical narratives of Samuel's, Saul's, and David's lives and doings before him. As regards the occasional verbal agreement between S. and Chronicles, which has often been commented upon, we may either assume that the latter drew upon the former, or that they both—which is more probable from internal evidence—drew upon the same source, and modified their accounts according to their special tendencies. Altogether, the work before us bears the character of a truly authentic record. Of modern commentators, we mention principally Hensler, Königsfeldt, Thenius, and Ewald.

SAMYDA'CEÆ, a natural order of exogenous plants, which are all trees or shrubs and all tropical, mostly American. The order contains about 80 known species, generally characterized by astringency in the bark and leaves. Some are used in medicine, to make poultices for wounds, lotions for ulcers, &c. The foliage of *Casearia esculenta* is eatable.

SANÄA', the principal district in Yemen or Arabia Felix, corresponding to the ancient Sába, or Sheba, the land of the Sabeans (q. v.). Its extent is very undefined, but it may be taken to include the country round the capital bearing the same name, to a distance of half a day's journey on the west, north, and east, and on the south it is bounded by the Teháma and the districts of Láhej and Yáffa.

While the dynasty of the Imáms existed, their sway extended over a much greater space, sometimes, indeed, over the whole of Yemen. Gradually it was encroached upon by the Sheikhs, who had been subject or tributary to them, and by the Turks. A bad system of government prepared the way for intestine strife; on the death of each sovereign, the succession was disputed, until at length the very shadow of regular government has passed away. In July 1872, S. was again occupied by the Turks, who afterwards overran the greater part of Yemen.

The city of Sanäa, once capital of the Imáms of Yemen, is situated in a deep and beautiful valley, about twenty or thirty miles in length, and six or seven in breadth, and 4000 feet above the level of the sea. The population of the city has been estimated at 40,000, and of the valley at about 70,000. This valley is bounded on the east by a high range of mountains called Jebel Nikkum, and is studded throughout its length with large villages.

The city and its suburbs are both surrounded by high walls, and, including the gardens, the circumference is about five and a half miles. The houses are of brick, well and strongly built, and most of them furnished with fountains, while the palaces of the Imáms, almost approached magnificence. The Jews, of whom even now there are about 20,000, have a quarter to themselves, distant about half an hour's walk from the Mohammedan town: it contains many buildings, once the abode of affluence and ease, but now bearing unmistakable signs of the devastation committed by the savage and fanatical Mohammedans of the city. The city walls are of unburned brick, and mounted with cannon, but they are in a very bad condition. There are four gates, and at both east and west end a castle containing a palace built in the Saracenic style with extensive gardens round them, and constructed with a view to defence, but now utterly neglected. See YEMEN.

SAN ANTO'NIO, called also San Antonio de Bexar, a city of Texas, U.S., is built near the sources of the San Antonio River, 110 miles south-west of Austin. It is one of the oldest Spanish towns on the continent, and in the Texan revolution of 1836 was the scene of the massacre of the Alamo, when a garrison of 150 men, led by Colonel Travis, and including David Crockett, was surrounded by several thousand Mexicans, and after a heroic resistance killed to the last man. It contains an arsenal and ten churches. Pop. (1870) 12,256; (1880) 20,561.

SAN CASCIA'NO, a city of Central Italy, province of Florence, and ten miles south-west of the city of that name. Pop. 6860. It is well built. The lands belonging to it produce a very strong wine, highly prized in Italy, also grain, oil, fruit, and mulberries.

SANCHUNIA'THON (SANCHONIATHON, SOUNIAITHON), the supposed author of a Phœnician history of Phœnicia and Egypt, called *Phoinikika*. He is supposed to have been a native of Berytus; and the accounts which speak of him as born at Sidon or Tyre, probably take these cities in their wider sense for Phœnicia itself. Our principal information about him is derived from Philo of Byblus, a Greek writer of the beginning of the 2d c. A.D., who translated S.'s history into his own tongue; but both the original and the translation are lost, save a few small portions of the latter, preserved by Eusebius, who uses them as arguments in a theological dispute against Porphyry. According to Philo, S. lived during the reign of Semiramis, Queen of Assyria, and dedicated his book to Abibalus, king of Berytus. Athenæus, Porphyry, and Suidas, on the other hand, speak of him as of an ancient Phœnician, who lived 'before the Trojan war.' There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phoinikika*. Orelli (1826), and after him, C. Müller (1849), published the remaining fragments of S., and the hot discussion raised on their genuineness and value is far from being settled yet. Several critics went so far as to deny the fact of the existence of a S. point blank. According to some (Lobeck, &c.), it was Eusebius; according to others (Movers, &c.), Philo, who fathered his own speculations upon an ancient authority. The latter was actuated, Movers thinks, partly by the desire of proving that the whole Hellenistic worship and religion was simply a faint imitation of the Phœnician; partly by the desire of lowering the value of the Old Testament, by showing the higher authority of the Phœnician writer; and partly, as was the fashion among the unbelieving philosophers of his age, to bring the popular creed into a bad reputation, by proclaiming his own views under the guise of an ancient sage.

Yet even those who deny the authenticity of S., agree in allowing the fragments current under his name a certain intrinsic value, they being founded on real ancient myths. This, in fact, is now, with more or less modification on the part of the different investigators, Ewald, Bunsen, Renan, &c., the prevalent opinion. Ewald contends for the real existence of a S., in which he is supported by Renan. Even if there never was a S., it was not Philo who forged him. There seems no doubt that we have but a very dim and confused reproduction of what, after many modifications, misunderstandings, and corruptions, finally passed the hands of Philo and Eusebius, and was by the Church Father, as we said, quoted in a theological disputation. Yet, even assuming the person of a S., his age—and he insists upon a very remote one indeed—must be placed much lower: into the last centuries before Christ, at the earliest. He would then, it seems, have endeavored to stem the tide of Greek superiority in all things, by collecting, grouping, and remodelling the ancient and important traditions of his own country, and thus proving to both his countrymen and to the Greeks their high importance, in comparison with the Greek productions, on the field of religion and philosophy.

The *Phoinikika* was not only a cosmogony, it would appear, but a history of his and the surrounding nations; and like similar ancient histories, it probably began with the creation of the world, and contained an account of the Jews. All the historical parts, however, are lost, and nothing remains but a fragmentary cosmogony, or rather two or three different systems of cosmogony, or, according to Movers, merely an Egyptian and Phœnician patchwork, for a brief account of which we refer the reader to the article PHŒNICIA. One of the chief difficulties for us consists in the Phœnician words of S., which Philo either translated too freely, or merely transcribed so faultily in Greek characters as to render them an everlasting puzzle.

Eusebius further contains a fragment of a treatise by S., *Peri Judaión*, but it is doubtful whether this is the work of Philo of Byblus or of S.; and if it be that of the latter, whether it is a separate work, or merely a separate chapter out of his larger work. A forgery, said to contain the whole nine books of S., and to have been found by a Portuguese, Colonel Pereira, at the convent of St. Maria de Merinhão, and to have been by him intrusted to a German corporal in Portuguese service, named Christoph Meyer, was published by Wagenfeld (Bremen, 1837), and translated into German (Lübeck, 1837), but was very soon consigned to disgrace and oblivion by Movers, K. O. Müller, and Grotefend, the last of whom had at first not only believed in its genuineness, but even written a preface to the *editio princeps*. There never was such a convent or such a colonel; but the facsimile taken by 'Pereira' in the convent in Portugal was found to have been written on paper showing the water-marks of an Osnabrück paper-mill.

SANCROFT, DR. WILLIAM, an English archbishop, historically notable as the most distinguished dignitary among the *Nonjurors* (q. v.), was born at Fresingfield in Suffolk, January 30, 1616, educated at the grammar-school of Bury St. Edmunds, and at Emanuel College, Cambridge. S. was reckoned a first-rate

scholar by his contemporaries; and in 1642, S. was elected Fellow of his college, but in the following year he was deprived of his fellowship by the Puritans for refusing the famous 'Engagement,' after which he went abroad. On the restoration of Charles II., in 1660, he was appointed chaplain to Cosin, Bishop of Durham; and after several preferments, was in 1668 made Archdeacon of Canterbury, and in 1677 was raised, against his inclination, to the first dignity in the church—the archbishopric of Canterbury.

The manner in which S. discharged his ecclesiastical duties deserves the highest commendation. He attended King Charles II. on his death-bed, and is said to have spoken very freely to the once 'merry monarch' on the nature of his past life. In 1688, along with several of his brother-bishops, he was committed to the Tower by King James II., for sending him a petition in which they explained why they could not conscientiously order his declaration in favor of liberty of conscience to be read in the churches; but in the events which immediately preceded and accompanied the great Revolution, he played a somewhat ambiguous and perplexing part. At first he refused when James asked him to sign a declaration expressing abhorrence of the Prince of Orange's invasion. Later (December 1683), he even went the length of concurring in an address to William, yet he seems from this point to have drawn back, and to have fallen under the dominion of his theory of the Divine Right of Kings. He was not present at the convention of the lords spiritual and temporal to meet the new monarch, and after the settlement, he refused, along with seven other bishops, to take the oath of allegiance to the government, in consequence of which he was suspended by act of parliament, August 1, 1689, but his actual departure from Lambeth did not take place till June 23, 1691. He then retired to his native village, where he died, November 24, 1693. See Macaulay's *History of England*, vols. ii. iii. and iv.

SANCTIFICA'TION, in distinction from justification, in the nomenclature of Protestant theology, is the process by which the Holy Spirit renews man in the divine image, destroying within him the power of evil, and quickening, educating, and strengthening in him the life of goodness and holiness. Whereas justification is considered as a judicial act on the part of God's free grace, liberating the sinner from condemnation, absolving and pardoning him once for all, sanctification is reckoned a work or process, advancing in various stages of weakness or strength, and only completed in the future life of the believer, when removed beyond the influences of sin that now surround him. In Roman Catholic theology, this distinction between the initiative of the divine life in man (justification) and its progressive development (sanctification), is not maintained, at least in the same precise and logical manner that it has been advocated by Protestants. By the latter, the distinction has been held of first-rate importance in their theological systems, and no less so in their practical conception of the Christian life.

SA'NCTUARY, a consecrated place which gives protection to a criminal taking refuge there; or the privilege of taking refuge in such a consecrated place. Among the Jews, there were cities of refuge to which the slayer might flee who killed a man unawares, and something analogous to a right of sanctuary may also be traced in pagan communities. In the ancient Greek states the temples, or at least some of them, afforded protection to criminals, whom it was unlawful to drag from them, although the food which was being supplied might be intercepted. As early as the 7th c., the protection of sanctuary was afforded to persons fleeing to a church or certain boundaries surrounding it. The canon and more ancient ecclesiastical law recognizes this protection to criminals as continuing for a limited period, sufficient to admit of a composition for the offence; or, at all events, to give time for the first heat of resentment to pass, before the injured party could seek redress. In several English churches there was a stone seat beside the altar where those fleeing to the peace of the church were held to be guarded by all its sanctity. One of these still remains at Beverley, and another at Hexham. To violate the protection of this seat, or of the shrine of relics, was an offence too grave to be compensated by a pecuniary penalty. Connected, in England, with the privilege of sanctuary was the practice of *abjuration of the realm*. By the ancient common law, if a person guilty of felony took the benefit of sanctuary, he might, within forty days afterwards, go clothed in sackcloth before the coroner, confess his guilt, and take an oath to quit the realm, and not return without the king's license. On confessing and taking the oath, he became attainted of the felony, but had forty days allowed him to prepare for his departure, and a port assigned him for embarkation, to which he must immediately repair with a cross in his hand, and embark with all convenient speed. If he failed to depart, or afterwards returned without license, he was condemned to be hanged, unless he happened to be a clerk, in which case he was allowed the *benefit of clergy*.

By the ancient canons of the Scottish councils, excommunication was incurred by the offence of open taking of theives out of the protection of the church. Some churches, however, by their superior sanctity, were held practically to afford a much surer asylum than others, and it was not uncommon for the Scottish kings, with the view of strengthening the hands of the church, to give a formal sanction to particular ecclesiastical asylums. One of the most celebrated sanctuaries in Scotland was the church of Wedale, now called Stow, where was an image of the Virgin believed to be brought by King Arthur from Jerusalem. David I. granted the 'King's Peace,' in addition to the protection of the church, to all fugitives from peril of life or limb who betook themselves to the church of Lesmahagow. The Scotch law of sanctuary or *gryth* was, however, guarded from affording too easy an immunity.

A very remarkable right of sanctuary existed in Scotland under the name of the *privilege of Clan Macduff*, which was alleged to have been granted by Malcolm Canmore on recovering the throne of his ancestors. Any person related within the ninth degree to the chief of Clan Macduff, who should have committed homicide without premeditation, was entitled, on fleeing to Macduff's Cross in Fife, to have his punishment remitted for a fine, or at least to be repledged from any other jurisdiction by the Earl of Fife. There is evidence of this privilege having saved Hugh de Arbuthnot and his accomplices from being proceeded against for the murder of John de Melvil of Glenbervie in 1421.

While the institution of sanctuary often enabled criminals to bid defiance to the civil power, it no doubt was not unfrequently a protection to the innocent, who thus escaped oppression or private enmity pursuing them under the name of law. In rude and unsettled times it seems, on the whole, to have operated beneficially by throwing the control of society into the hands of the clergy, who were less tempted than any other class to misuse that power. But as the civil power and authority of the law were strengthened, the right of sanctuary became useless and mischievous; the civil power endeavored to narrow the privilege as far as possible, while the church sought hard to preserve it. The English Reformation, though it greatly restricted, did not abolish the right of sanctuary. It was not till 1534 that persons accused of treason were debarred the privilege, and the right of sanctuary for crime was finally abolished by 21 Jac. I. c. 28. Various precincts, however, in and about London, known as sanctuaries, continued to afford shelter to debtors, all which were done away with in 1697, by Act 8 and 9 Will. IV. c. 26.

In Scotland there still exists a sanctuary for debtors in the Abbey and Palace of Holyrood, with its precincts, including the hill of Arthur Seat and the Queen's Park. The sanctuary is placed under the control of a bailie appointed by the Duke of Hamilton as heritable keeper of Holyroodhouse. When a debtor retires to the sanctuary, he has a 24 hours' protection against personal diligence; but in order to extend the privilege longer, he must be enrolled in the books of the abbey. The sanctuary affords no protection to a criminal, a fraudulent debtor, or a crown debtor; nor is it available for protection from personal execution for debts contracted within its precincts, for which the debtor may be imprisoned in the abbey jail.

SAND, GEORGE. See DUDEVANT, MADAME.

SANDALS, a covering for the feet, consisting of soles so attached as to leave the upper part of the feet bare. See SHOES.

SA'NDAL-WOOD (a name corrupted from *Santal* wood), the wood of several species of the genus *Santalum*, of the natural order *Santalaceæ* (q. v.), natives of the East Indies and tropical islands of the Pacific Ocean. S.-W. is compact and fine grained, very suitable for making work-boxes and small ornamental articles, and is remarkable for its fragrance, which however, is fatal to insects, so that cabinets of S.-W. are extremely suitable for the preservation of specimens in natural history; but it is much too expensive for general use. The odor is due to an essential oil, heavier than water. WHITE S.-W., the most common kind, is the produce of a small tree (*Santalum album*), a native of mountains in the South of India and the Indian Archipelago, much branched, resembling myrtle in its foliage and privet in its flowers. The trunk is seldom more than a foot in diameter. YELLOW S.-W. is probably produced by another species, perhaps *S. Freycinetianum* of the Indian Archipelago and Sandwich Islands, and from these regions the Chinese import it, chiefly for the purpose of burning it both in their temples and in their houses. They reduce it to sawdust, and mix it with paste before burning. Dr. Seemann has, however, recently found another and previously-unknown, species of *Santalum* (*S. Yasi*) to yield the much-valued S.-W. of the Fiji Islands, where the tree has been almost extirpated in consequence of the demand for its wood in commerce.

RED S.-W., or SANDERS, is the produce of a very different tree, *Pterocarpus santalinus*, of the natural order *Leguminosæ*, suborder *Papilionaceæ*, a native of the tropical parts of Asia, particularly of the mountains of the south of India and of Ceylon. The tree is about sixty feet high, with pinnated leaves, having gener-

ally three leaflets, and axillary racemes of flowers. The heart-wood is dark red, with black veins, and so heavy as to sink in water. It is used as a dye-stuff, and also by apothecaries to color certain preparations. The Arabs use it as an astringent, and it is the basis of some of our tooth-powders.—A deep red dye is also yielded by the chips of *Adenanthera pavonina*, a tree allied to the *Acacias* (q. v.), a native of the East Indies. The wood of this tree is sometimes called RED SANDAL-WOOD.

SANDALWOOD ISLAND called by the natives Tjindana, Sumba and Tanah Tjumba, lies in the Indian Ocean, between 9° 18′—10° 20′ S. lat. and 118° 58′—120° 43′ E. long., has an area of 4966 sq. m., and a pop. of 1,000,000. The coast is steep and rocky, so that, except at the west, south, and east corners, ships can approach quite near. The produce consists chiefly in dye-woods, ebony, timber, cotton, rice, pepper, cocoa, maize, coffee, sugar, wild cinnamon, cocoa-nuts, and various fruits. Little sandal-wood is exported, though abounding in the forests, the natives refusing to cut the trees, which they believe to be the dwellings of their ancestors' souls. Exports are: horses, timber, cotton, pepper, wax, tortoise-shell, tow made from bark, maize, and edible nests. The cliffs swarm with the *Collocalia esculenta*, and collecting the nests is a leading occupation of the men. The Sandalwood islanders belong to the Malay race, are well made, wiry, and of a brownish complexion. The most trifling causes lead them to commit suicide, a vice of rare occurrence in other parts of the archipelago.

The S. I. is nominally subject to the Netherlands, but the rajahs and regents are almost independent of foreign influence. The principal havens are at Nangamessi on the north, and Tida about the middle of the south coast, good anchorage being found in many other parts. Notwithstanding the repressive measures taken by the Netherlands government, and the destruction, in 1860, of ten vessels engaged in the slave-trade, it is still extensively carried on by the Sandalwood islanders.

SA'NDARACH, or SANDARACH RESIN, is a friable, dry, almost transparent, tasteless, yellowish-white resin, which is imported from the north of Africa. It is completely soluble in oil of turpentine, but not completely soluble in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the S. tree (*Callitris quadrivalvis*), a native of the north of Africa, of the natural order *Coniferæ*.—The quantity of S. used is not great; it is employed mostly for the same purposes as Mastic (q. v.). The finely-powdered resin is rubbed, as *Pounce*, on the erasures of writing-paper, after which they may be written upon again without the ink spreading.—The wood of the S. tree is highly balsamic and odoriferous, extremely durable and valuable.

SA'NDAY or SANDA ISLAND, one of the most northern of the Orkney (q. v.) group, contained, in 1881, 413 inhabited houses and 2082 inhabitants.

SA'NDBACH, a small market-town of Cheshire, 25 miles east-south-east of Chester by railway, on an eminence on the right bank of the Wheelock. Pop. (1881) 5493, mostly employed in silk-throwing, and in making salt and shoes.

SANDBAGS, in Military works, are canvas bags about 28 or 30 inches in length by from 14 to 16 broad. They are filled with sand or earth, and form a ready means of extemporizing a parapet or traverse against the enemy's fire; they are likewise used for protecting the head of a trench, or tamping the charge in a mine. See MINES, MILITARY. If employed as lining for embrasures or barbettes, sandbags should be covered with raw hides to prevent them from taking fire.

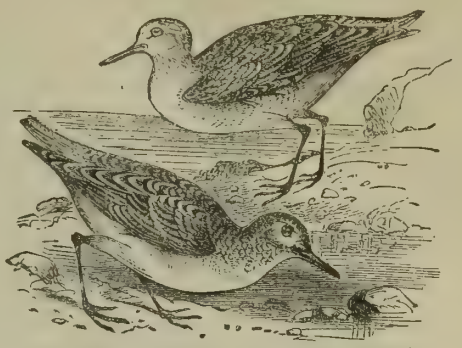
SAND BLAST, a method of engraving figures on glass or metal, or cutting away or boring holes in hard substances, by means of a stream of fine sand, driven by a blast of air or steam.

SA'NDCRACK is a splitting or fracture of the horny fibres of the horse's hoof, extending usually from above downwards; when reaching to the quick it causes lameness, and in all cases it constitutes unsoundness. Horses, with thin, weak, brittle feet, spoilt by much rasping, and rattled on the hard roads, furnish the majority of cases. The horn must be thinned for an eighth of an inch on either side of the crack; across the upper and lower ends of the crack, to prevent its extension, the firing-iron should be drawn, making a line nearly through the horny crust. The opening may further be held together by winding round the foot several yards of waxed string, or fine iron wire. Except in very bad cases, slow work on soft land may be permitted, but road work is injurious. The growth of healthy horn is promoted by applying round the coronet, at intervals of ten days, some mild blistering liniment.

SAND EEL. See LAUNCE.

SANDEMA'NIANS. See GLASSITES.

SA'NDERLING (*Calidris*), a genus of birds of the plover family (*Charadriadæ*), or which perhaps ought rather to be referred to the snipe family (*Scolopacidæ*). The Common S. (*C. arenaria*) is a very widely diffused bird, breeding in the Arctic regions, and migrating southwards on the approach of winter as far as the coasts of Africa, of India, and of Brazil. It is pretty common on the British coasts, in small flocks, in winter. It is



Sanderling, Male and Female (*Calidris arenaria*).

only about eight inches long; its winter plumage very light ash-gray, under parts white. In spring the plumage acquires a reddish tinge with black markings. The S. feeds on marine worms, small crustaceans, &c. It is esteemed for the table, and appears in the London market.

SAND GROUSE. See GANGA.

SAND-HOPPER (*Talitrus locusta*), a small crustacean, of the section *Edriophthalma* (q. v.) and order *Amphipoda*, which so abounds on the sandy sea-shores of Britain, that the whole surface of the sand often seems to be alive with the multitudes which leaping up for a few inches into the air, fill it like a swarm of dancing flies. This activity is not, however, displayed at all times; but if a mass of sea-weed left by the retiring tide be turned over, countless sand-hoppers may be seen to leap away, or they may be found by digging in the sand, in which they burrow. The S. leaps by bending the body together, and throwing it open with a sudden jerk. It feeds on almost any vegetable or animal substance, particularly on what is already dead and beginning to decay. It is itself the food of crabs, and of many kinds of birds.

SANDHURST, ROYAL MILITARY COLLEGE. In 1802 it was determined to institute a college for the training of military officers, in which professional education should be grafted on the groundwork of general instruction. The college was opened at Great Marlow; but, in 1812, it was transferred to a handsome stone building at Sandhurst. Up to 1862, this was devoted to the education of boys from the age of 13 upwards; a description of the college as then existing is given under CADETS' COLLEGE. In that year, however, the system was changed; the course limited to one year immediately before entering the army, and the subjects of instruction confined to the higher mathematics, modern languages, and military science. Entrance was on the nomination of the commander-in-chief; and the payment by the cadet's parent or guardian varies from £100 to *nil*, according to the circumstances and rank of the parent. Those for whom no payment is made must be orphans, and are styled 'Queen's Cadets.' Under the purchase system, all first commissions in the cavalry and infantry of the line, which were granted without purchase, and not to men from the ranks, were given to cadets from the Royal Military College, who competed for these prizes, and obtained them in order of merit.

The abolition of purchase in 1871 brought about a radical change. The students are no longer boys intending to become officers: but sub-lieutenants, who, having passed by competition for the army, spend a year at Sandhurst in acquiring the theoretical part of the war science. To be confirmed in the army as lieutenant, the officer must pass creditably out of Sandhurst, and then serve a year on probation with a regiment. It cannot be doubted that this change of system must tend, as years go on, to secure for the army a great body of scientific officers.

The Staff College (q. v,) is a separate institution, about two miles distant.

The estimated charge for the Royal Military College for 1881—1882 was £40.642, of which about £5000 is covered by the payments for the students.

SA'NDHURST, a town of Victoria, 82 miles north-north-west from Melbourne, on the railway between Melbourne and Ebuca. It is the center of an important mining district of the Bendigo gold-fields. Pop. (1881) 28,128. The mines in the S. district, which comprehend nearly 800 auriferous quartz reefs, give employment to about 7000 men, of whom above 800 are Chinese.

SA'NDIVER, a product of the glass furnaces. When the materials used in the manufacture of glass are melted, a scum arises which has to be removed, this is called sandiver, and is,

when powdered, used as a polishing material, and formerly had a considerable reputation as a tooth-powder.

SAND-MARTIN. See SWALLOW.

SAN DOMI'NGO. See DOMINGO, SAN; DOMINICAN REPUBLIC.

SAND-PAPER is made in the same way as emery-paper (see EMERY), but with sand in place of emery.

SA'NDPIPER, the common English name of a numerous group of birds, generally referred to the family *Scolopacidæ*, all formerly included in the genus *Tringa*, but some now constituting the genera *Totanus*, *Pelidna*, *Actitis*, &c., of ornithologists. In characters and habits they are all very similar. They are not of large size; they are very active and graceful in all their movements; their plumage not gay, but of pleasing and finely-diversified colors; their legs are rather long, the lower part of the tibia naked, the tail very short, the wings moderately long; the bill rather long and slender, grooved throughout the whole or a considerable part of its length, straight in some, and a little arched in others. The feet have three long toes before, and one short toe behind; the toes in the genus *Tringa*, as now restricted, are partially webbed at the base, in *Totanus* they are completely separate. They are good swimmers, but are not, however, often seen swimming; they frequent sandy sea-shores, some of them congregating in numerous flocks in autumn and winter; and seek their food by probing the sand with their bills, and by catching small crustaceans in pools or within the margin of the sea itself. Many are birds of passage, visiting high northern latitudes in summer, and spending the winter on the coasts of more southern regions. The flesh of all the species is good, and some of them are in much request for the table.—The British species are numerous. The DUNLIN or PURRE (*Tringa variabilis*) is noticed in the article DUNLIN. The KNOT (*Tringa canutus*), also known, in different states of plumage, as the RED S. and the ASH-COLORED S., is a bird of about ten inches in length, appearing in great flocks on the British coasts in winter, and equally common in North America.—The LITTLE S. or LITTLE STINT (*Tringa minuta*), occasionally seen in Britain, occurs in India and in South Africa.

The name STINT is given to a number of species of *Tringa*.—The PURPLE S. (*Tringa maritima*), not unfrequent on the British

Redshank (*Totanus calidris*).

coasts, is reckoned among the birds of Iceland, Greenland, Melville Island, Nova Zembla, and Spitzbergen. Of the genus *Totanus*, to all the species of which the popular name GAMBET is

Common Sandpiper (*Totanus hypoleucos*).

sometimes given, one of the best known species is the REDSHANK (*Totanus calidris*), a bird which resides in Britain all the year, but known also as a summer bird of passage in the most northern parts of Europe and Asia, and occurring in winter as far south as Smyrna, and even in India. It is about eleven inches long It receives its popular name from its red legs.—The GREEN S. (*Totanus ochropus*) is also a pretty common British species, for the most part migrating to the north for the summer.—The COMMON S. or SUMMER SNIPE (*Totanus hypoleucos*) is in Britain a summer bird of passage.—The GREENSHANK (*Totanus glottis*) is chiefly seen in Britain in spring and autumn, and has its name from the olive-green color of its legs.—Sandpipers of various species—some of them the same as the British, and others different—are numerous in North America, and in winter in the West Indies.

SANDPIPES are cylindrical hollows existing in chalk deposits. They descend perpendicularly into the chalk at right angles to the surface, tapering downwards, and ending in a point; they reach occasionally a depth of 60 feet, and have a diameter varying from 1 to 12 feet. They are most probably produced by the chemical action of water, charged with carbonic acid, which exists more or less in all rain-water, and is especially abundant in water that has been in contact with decaying organic matter. The pipes are filled with sand, clay, or gravel from the overlying deposit.

SANDROCO'TTUS or SANDROKYPTOS, is the Greek spelling of the name of the Hindu king Chandragupta, of Pât'aliputra or Palibothra, to whom Megasthenes was sent as ambassador from Seleucus Nicator, and who lived about the beginning of the 4th c. B.C.

SANDSTONE is a rock formed of compacted, and more or less indurated sand. The grains generally consist of quartz, though other mineral substances are often mixed with this; they are colorless, or of a dull white, yellow, brown, red, or green color. The grains vary in size, forming, as the case may be, a fine or coarse grained stone. The loose sand becomes solidified by pressure simply, but more generally from being cemented together by calcareous, silicious, or ferruginous infiltrations, and the dark color of the mass is produced by the cement. Sandstones that have undergone great or continuous metamorphic action, pass into Quartzite; and between this and friable sand, all intermediate stages are found.

SANDU'SKY, a city and port of Ohio, U. S., on the south shore of Sandusky Bay, an arm of Lake Erie, 110 miles north of Columbus. The bay, 20 miles long and 5 wide, forms an excellent harbor. The city is built upon a bed of limestone, of which its edifices are constructed, among which are a custom-house, 14 churches, 3 banks, large public halls, hotels, schools, &e. There are several newspapers, manufactures of lumber and bent woodwork for carriages, &c., with extensive fisheries. Pop. in 1860, 8408; in 1870, 13,000; in 1880, 15,838.

SA'NDWICH (i. e., village on the sands), a Cinque Port, market-town, and municipal borough of Kent, on the right bank of the Stour, 98 miles east-south-east of London by the South-Eastern Railway. Within the last 800 years the sea has here considerably receded, for S., which is now two miles from the shore, is described at the commencement of the 11th c., as the most famous of all the English harbors—*omnium Anglorum portuum famosissimus*. The town is rectangular, and was surrounded by walls along which a broad path now leads. The streets are confined; and the houses, which seem crushed together, and the architecture of which recalls the times of the Plantagenets, are peculiarly and strikingly antique in appearance. The church of St. Clement's with a low Norman tower, is probably the most interesting edifice. Small vessels importing timber, iron, and coal, and expoting corn, flour, malt, seeds, and hops, come up to the town. Tanning, shipbuilding, and seed-crushing are carried on. With Deal and Walmer, the town used to send two members to parliament; but S. is one of the boroughs which has been disfranchised for corrupt practices during seven years, from the first meeting of parliament, 1883. Pop. (1871) of mun. borough, 3060; (1881) 2846; of the parl. borough of S. and Deal, 14,885; (1881) 15,566.

S., the most ancient of the Cinque Ports, probably occupies the site of the Roman *Rutupiæ*, and many interesting antiquities have been found in the vicinity. In the reign of Edward IV. its customs yielded £17,000 yearly, and 95 ships and 1500 sailors belonged to it.

SANDWICH, said to have been named after the Earl of Sandwich, consists of two thin slices of bread, with some savory food placed between.

SANDWICH ISLANDS, the name given by Captain Cook to the islands forming the kingdom of Hawaii (so called from the chief island), Lord Sandwich being then first Lord of the Admiralty. They are a rich, beautiful, and interesting chain, eight in number, exclusive of one or two small islets. The chain runs from south-east to north-west, and lies in the middle of the Pacific Ocean, in lat. 19°—22° N., long. 155°—160° W. Area, 7600 sq. m.; pop. (1878) 57,985, of whom 4561 were Europeans. The names, with the areas of the respective islands, are: Hawaii (formerly Owhyhee), 4850 sq. m.; Maui, 750; Oahu, 700; Kaui, 780; Molo-

kai, 170; Lanai, 170; Niihau, about 110; and Kahoolaui, about 40 sq. miles.

Surface, &c.—Situated near the middle of the Pacific Ocean, about half the distance from San Francisco in North America that they are from Melbourne in Australia, and Canton in China, the S. I. form an oasis in the middle of a wide ocean waste, and offer convenient stations for the refreshment and repair of the merchantmen and whalers that traverse the Pacific. They are of volcanic origin, and contain the largest volcanoes, both active and quiescent, in the world. The most prominent physical features of the group are the two lofty mountain peaks of Hawaii, Mauna Kea and Mauna Loa, each of which is 14,000 feet in height, or within 1800 feet of the loftiest of the Alps. Besides these two chief peaks, which stand apart from each other, and one of which is covered with perpetual snow, the island is traversed by other mountains, which give it a rugged and picturesque outline, and in some cases front the sea in bold, perpendicular precipices, from 1000 to 3000 feet in height. In general, the islands are lofty—the small islet of Lehua is 1000 feet high, and the upland regions of Kaui are, on an average, 4000 feet above sea-level.

Within the coral reefs, which, in single, and more rarely in double ridges, skirt portions of the coast, sandy shores, leading up to rich pasture-lands, and occasionally to productive valleys, are frequently seen. Everywhere, however, the configuration of the surface betrays the volcanic origin of the islands. Extinct and partially active volcanoes occur in most of the islands. Kilauea, on the Mauna Loa mountain in Hawaii, the largest active volcano in the world, has an oval-shaped crater 9 miles in circumference, and is 6000 feet above sea-level. In the center of this immense caldron is a red sea of lava, always in a state of fusion. At intervals, the lava is thrown to a great height, and rolls in rivers down the mountain sides. From 1856 to 1859, this volcano was in an incessant state of eruption, forming at night a sublime spectacle, and occasionally casting forth burning streams, by one of which a small fishing-village was destroyed, a bay on the shore filled up, and a promontory formed in its place. On Maui, the crater of Mauna Haleakala (House of the Sun), by far the largest known, is from 25 to 30 miles in circumference, from 2000 to 3000 feet deep, and stands 10,000 feet above sea-level. Within this huge pit, about 16 basins of old volcanoes, whose ridges formed concentric circles, have been counted. Good harbors are few. The chief is that of Honolulu (q. v.), in Oahu, with 22½ feet of water in its shallowest parts. On the same island is Ewa, an immense basin, with 12 feet water at low-tides. During the prevalence of the trade-wind, which blows south-west for about nine months of the year, the south shores of the islands affords safe anchorage almost everywhere.

Climate, Soil, Rivers, &c.—Though situated within the tropics, the S. I. boast a climate that is temperate rather than tropical. In the native language, there is no word to express the idea of *weather*, and this fact may be considered as evidence that extremes of heat or cold do not occur. At Honolulu, the extremes of temperature in the shade during 12 years were 90° and 53°, and the diurnal range is 12°. Rains brought by the north-east trade-wind are frequent on the mountains; but on the leeward side of the islands, little rain falls, and the sun is rarely obscured by clouds. The soil, the constituent parts of which are mainly scoriæ, decomposed lava and sand, is generally thin and poor. This, however, is not universally the case. At the bases of the mountains and in the valleys, where abraison, disintegration, and the accumulation of vegetable mould, have gone on for ages, there are extensive tracts as fertile as they are beautiful. The islands produce fine pasturage in abundance, and large herds are bred and fattened, to supply meat to the whalers and merchant-ships. On the Waimea Plains, in Hawaii alone, 30,000 sheep of the merino breed are grazed. The upland slopes of the mountains are clothed with dense forests; and lower down, are grassy plains and sugar and coffee-plantations. Basalt, compact lava, coral-rock, and sand-stone, are used for building purposes. No metals occur. Several of the islands, especially Hawaii and Kaui, are well supplied with rivers, which, from the size and conformation of the group, are necessarily small, but afford great facilities for irrigation. Vast numbers of semi-wild horses roam the islands, and while they consume the pasturage, and break down the fences, are of little use.

The indigenous fauna is small, and consists mainly of swine, dogs, rats, a bat that flies by day, birds of beautiful plumage, but for the most part songless. Among the indigenous trees and plants are the sugar-cane, banana, plantain, cocoa-nut, candle-nut, various palms, the taro, a succulent root which formed the staple of the food of the natives, and is still generally used; the cloth-plant; and the *ti*, the roots of which were baked and eaten, while the leaves were used for thatching huts. Cattle and other useful foreign animals and plants were introduced by Vancouver and other navigators. There are about 30,000 mules and semi-wild horses in the kingdom.

Commerce, Products, &c.—The commerce of this young kingdom is still in its infancy, but is gradually on the increase. Until recently, the most important branch of it was maintained by vessels engaged in the whale-fisheries of the North Pacific. This branch of commerce has greatly declined within recent years. In 1878, 27 whaling-vessels, showing a decrease of 20 as compared with the number in 1872, entered the ports. Trusting no longer to the whaling business, the producers and merchants of the S. I. have found out other outlets for their goods, and, without doubt, the trade of the islands will in the future be almost wholly confined to the coasts that bound the Pacific. The islands are within 16 days (by sailing-vessels) of San Francisco, 27 days from Vancouver's Island, 26 days from Kanagawa in Japan, and 67 days from Hongkong. Sugar, coffee, and rice have been proved to produce well, and all these find ready markets at hand in California, British Columbia, and Vancouver's Island, which, together, can consume more than the S. I. can supply. Of sugar, the 3,000,000 lbs. produced in 1862 were increased to nearly 40,000,000 in 1878, and from the number of new plantations recently organized, the amount of produce may be expected to continue increasing. The exports, consisting mostly of sugar, coffee, rice, pulu (q. v.), hides, and corn, amounted in 1882 to £1,371,087; the imports, mostly manufactured goods, amounted in the same year to £909,595.

History, Constitution, and Finances.—Of the origin and character of the inhabitants of this kingdom, of its interesting internal history, or of the much-canvassed question as to whether the native race will flourish along with or wither before the Saxon race, it is not within our limits to speak. We can only notice a few of the leading events which have occurred in these islands since their shores were first visited by what the natives called the 'floating islands' of the civilized nations. Although one member of the group was seen by Gaetano in 1542, the islands cannot be said to have been discovered till Cook visited them in 1778. The great navigator treated the simple and confiding natives with a cruelty and a hypocrisy which consort ill with his fame, and which were the direct causes of the brawl in which he met the death he had provoked in Kealakeakua Bay, Hawaii, in 1779. In early times, each island had a king; but under Kamehameha I., a man of shrewd sense, and of great bravery and resource, the islands were formed into one kingdom. This king, writing to George III., August 6, 1810, desired formally to acknowledge the king of England as his sovereign, and to place the islands under British protection—an offer which was accepted. After inaugurating the era of advancement, this king died in 1819, and was succeeded by Liholiho, who adopted, on his accession, the name of Kamehameha II., and in whose reign idolatry was abolished simultaneously throughout all the islands. The first Christians who visited the S. I. were Cook and his followers, of whom the simple natives retained no favorable impression.

Vancouver, who arrived with Cook in 1778 and returned in 1792, and again in 1794, made sincere attempts to enlighten the natives, and the king and his chiefs requested Vancouver to send out religious teachers to them from England; but the first missionaries that visited the islands came from America in 1820. On their arrival, the missionaries witnessed the singular phenomenon of a nation without a religion. The instructions of Vancouver had not been forgotten, and no doubt enabled the idol-worshiping islanders to see more readily the absurdities of their system. But the spontaneous movement of 1819—1820, when the whole nation rose up to destroy idols, temples, and the furniture of idolatry, 'was no triumph of Christianity—for Christianity had not yet claimed or even approached the Hawaian Islands.' The nation had voluntarily cast off the religion of their ancestors, and had not yet adopted—were not even acquainted with—any other system. The American missionaries who arrived in 1820 were well received, and the work of instruction was at once begun. Besides instructing them in Christianity, in less than 40 years they taught the whole Hawaian people to read and write, to cipher and to sew.

Kamehameha II. and his queen visited England, and after a short residence in this country, both died in London, July 1824. Prior to the year 1838, the government was a despotism; but in 1840, the king, Kamehameha III., granted a constitution, consisting of king, assembly of nobles, and representative council. This constitution, based on that of Great Britain, has in more recent times been much matured and improved. In 1843, the independence of the Hawaian kingdom was formally declared by the French and English governments. Kamehameha IV. acceded to the throne in 1854, and after a useful reign, died in 1863, and was succeeded by his brother, Kamehameha V. Lunalilo followed in 1873, and in 1874 Kalakaua, who visited Europe in 1881. The revenue for 1882 was £445,070; expenditure, £549,157.—See Miss Bird's *Six Months in the Sandwich Islands* (1875); Miss Gordon Cumming's *Fire Fountains* (1883).

SANDWORT. See ARENARIA.

SAN FE'LÉ, a town of South Italy, in the province of Potenza, 17 m. N.W. of Potenza. Pop. 10,500.

SAN FELI'PÉ DE ACONCA'GUA, a town of Chili, capital of the dep. of Aconcagua, 60 miles east-north-east of Valparaiso. It is regularly built, and has a handsome appearance. In the vicinty are copper-mines. Pop. stated at from 12,000 to 13,000.

SAN FELIPE DE JATIVA. See JATIVA.

SAN FRANCI'SCO, the principal seaport on the western coasts of North America, and the chief city of California, U.S., stands on the west shore of San Francisco Bay, 6 miles south of the Golden Gate, the outlet leading west, and connecting the bay with the Pacific Ocean. Lat. 37° 46′ N., long. 122° 23′ W. It has a fine deep harbor, well-built streets, handsome shops, gas and water works, and elegant public buildings, among which are the custom-house, mint, city hall, marine hospital, city hospital, theaters, orphan asylums, a convent, &c. There are about 75 churches, 11 daily and 46 other newspapers, numerous schools and charitable institutions, and several fire insurance companies. Of the population attracted by the discovery of gold to S. F., a great number are Irish, German, British, French, and Chinese. There are newspapers in English, French, German, Spanish, Italian, and Chinese. The Chinese have a church, Roman Catholic, with a Chinese priest educated at Rome; and a school. Among the manufacturing establishments are flour-mills, saw-mills, woollen factories, and iron foundries. In recent years, the receipts of precious metals have sometimes amounted to above £12,000,000 in a year; but this sum does not nearly represent all the receipts, as much treasure comes by private hands, and passes through no channel by means of which the amounts can be noted by the authorities. The treasure exported in the last five years of the decade 1870—1880, varied from £5,250,000 to £11,550,000. The other exports were chiefly wheat, barley, wool, quicksilver, hides, furs, flour gunpowder, copper ore, wine, and tinned fruits. In 1875—1880, the value of wheat exported varied from £5,000,000 to £10,520,000 a year; the whole imports of foreign merchandise varied from £8,200,000 to £5,400,000, including sugar, coal, rice, coffee, tea, wines and spirits, iron, cotton, silk, and various manufactured goods. Numerous ocean-steamers run to the chief ports of the world. The Union Pacific Railroad, completed in 1870, makes S. F. an important point as the commercial highway from Europe and the Eastern United States to Asia. In 1776, the mission of St. Francis was commenced here by two Spanish monks. In 1825, the mission had under its care 1800 Indians, and possessed 76,000 cattle and 79,000 sheep. In 1834, the property of the mission was secularized, and it rapidly decayed. In 1846, it was taken by the United States, and in 1847 had a population of 450. The discovery of gold in 1848 caused it to be at first nearly deserted; but soon commenced a rapid growth, which, in spite of several destructive fires, has continued to increase. The Chinese, of whom there are about 20,000 in the city, occupy 'Chinese Quarter,' and have two theaters. Pop. of S. F. (1860) 55,626; (1870) 149,473; (1880) 233,956.

SAN FRATE'LLO, a town of Sicily, in the province of Messina, 53 miles west-south-west from Messina. At the base of the hill on which the town stands is a remarkable cave, discovered in 1859, and containing prodigious quantities of bones of mammals, with which flint implements are mixed. Pop. 7200.

SANGAREE', a West Indian beverage, consisting of Madeira wine, syrup, water, and nutmeg.

SANGERHAUSEN, a town of Prussian Saxony, 37 miles west of Halle. It carries on weaving, tanning, shoemaking, and copper-smelting, and manufactures saltpeter. Pop. (1880) 9136.

SANGI'R ISLANDS lie to the north of Celebes, in 2°—4° N. lat., are upwards of 50 in number, of various sizes, and nearly all inhabited. Pop. 80,000. The three largest islands, Great S., Sjiauw, and Tagolandang, with those which surround each, form as it were separate groups. In the S. I. are many mountains, which, except the volcanoes, are clothed to their summits with a rich vegetation. Great S. has an area of 273 sq. m., and is divided into four kingdoms. The usual anchorage is on the west side, in 3° 28′ N. lat., and 125° 44′ E. long. Pop. 13,000. In the north-west is a volcano, called Abu, or the 'Ash Mountain,' which has frequently caused great devastation. In March 1856, the streams of lava and boiling water carried away the rich plantations, and 2806 lives were lost.

Sjiauw lies in 2° 43′ N. lat., and 125° 28′ E. long., is also mountainous; a volcano, on the north-east coast, being 6200 feet high. Pop. 3000. The chief town is Uluw.

Tagolandang, in 2° 20′ N. lat., and 125° 30′ E. long., is populous, and the center of the missionary work which has been carried on successfully in the S. islands. A small ship belongs to the station, in which to visit the scattered converts and schools.

In all the islands, the areng (*Saguerus* or *Borassus gomutus*), the sago, cocoa-nut, and the finest sorts of timber-trees abound. Maize, rice, katjang (a species of bean), tobacco, cocoa, and the sugar-cane are cultivated.

The Sangirese belong to the Malay race, are well made and brave, but cunning, lazy, and dirty in their habits. This, and scarcity of pure drinking-water, make them liable to a loathsome skin disease. There are four rajahs in Great S., one in Tagolandang, and one in Sjiauw. The government is monarchical, somewhat limited by a council.

Towards the end of the 15th c., the Sangirese became Mohammedan; a century later, under the Portuguese, they were brought over to Christianity. These islands, forming now a Netherlands dependency, have several Dutch missionaries, and 24 churches, which are also used as schools. Government supports 8 teachers, the villages 16.

SANG-KOI. See TONQUIN.

SANGRAAL. See GRAAL.

SANGUINA'RIA, a genus of plants of the natural order *Papaveraceæ*, having 8—12 petals, 2 stigmas, an oblong swollen capsule with two deciduous valves, and a persistent, many-seeded frame. *S. Canadensis*, the BLOOD-ROOT or PUCCOON of North America, has a fleshy root-stalk abounding in a red juice, which abounds also in the leaf-stalks; and solitary radical leaves, which are roundish, deeply heart-shaped, and with about seven toothed angles. The flowers are solitary and spring from the root, on short stalks. The whole plant is acrid and narcotic, emetic and purgative in large doses; and in small doses stimulant, diophoretic, and expectorant. It is much used as a medicine in the United States.—It is supposed to owe its properties to a peculiar alkaloid called *Sanguinarine*, which is obtained from it as a white pearly substance. The large white flowers appear early in spring, and are a frequent ornament of flower-borders.

SANGUINE, or MURREY, one of the tinctures of less frequent occurrence in Heraldry, denoting blood color, and represented in engraving by lines crossing each other saltireways.

SANGUISORBA'CEÆ, or SANGUISO'RBEÆ, according to some botanists a natural order of plants, but more generally regarded as a sub-order of ROSACEÆ (q. v.). As a sub-order, its distinctive characters are apetalous flowers—the tube of the calyx thickened, indurated, and lined with a disc, generally few stamens, and a solitary carpel, which ripens into a nut enclosed in the calycine tube. About 150 species are known, all of which are herbaceous or half shrubby, some of them spiny.—The leaves of *Acaena sanguisorba*, a native of Van Diemen's Land, are said to be an excellent substitute for tea. Of British species, Burnet (q. v.) and Lady's Mantle (q. v.) are among the best known.

SA'NHEDRIM (Gr. *Synedrion*), the supreme national tribunal of the Jews, established at the time of the Maccabees, probably under John Hyrcan. It consisted of 71 members, and was presided over by the Nasi (Prince), at whose side stood the Ab-Beth-Din (Father of the Tribunal). Its members belonged to the different classes of society: there were priests (*Archiereis*); elders, that is, heads of families, men of age and experience (*Presbyterοi*); scribes, or doctors of the law (*Grammateis*); and others, exalted by eminent learning—the sole condition for admission into this assembly. The presidentship was conferred on the high-priest in preference, if he happened to possess the requisite qualities of eminence; otherwise, 'he who excels all others in wisdom,' was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death, the ordeal of a suspected wife, and the like criminal matters, were exclusively in its hands.

Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the *cultus* in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings of the new moons; intercalated the years, when necessary; watched over the purity of the priestly families, by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service; and the like. By degrees, the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and Jerusalem itself. Thus, we hear of two inferior tribunals at Jerusalem, each consisting of 23 men, and others consisting of three men only. These courts of 23 men (lesser Synedrion), however, as well as those of the three men, about both of which Josephus is silent, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judge were those born in adultery; men born of non-Israelitish parents, gamblers; usurers; those who sold fruit grown in the Sabbatical year; and, in single cases, near relatives. All these were also not admitted as witnesses. Two scribes were always present, one registering the condemnatory, the other the exculpatory votes. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The Nasi had the su-

preme direction of the court, and convoked it when necessary. He sat at the head, and to his right hand was the seat of the Ab-Beth-Din; the rest of the 71 took their places according to their dignity, in front of them, in form of a semicircle, so that they could be seen by both the chief officers.

The lictors, or 'sheriffs,' were always present at the session. The court met on extraordinary occasions in the house of the high-priest; its general place of assembly, however, was a certain hall (*Lishcat Hagaziz*), probably situated at the south-east corner of one of the courts of the temple. With exception of Sabbath and feast days, it met daily. The political troubles forced the Sanhedrim (70 B.C.) to change its abode, which was first transferred to certain bazaars (*Hannyoth*) at the foot of the temple mount. After the destruction of the temple and Jerusalem, it finally established itself, after many further emigrations, in Babylon.

We cannot here enter into that most difficult question as to the origin and development of the Sanhedrim, and how far it was intended primarily to be a faithful reproduction of the Mosaic assembly of the 70 (Moses himself making 71), supposed to have been re-established by Ezra after the Exile; any more than we can examine in this place into the widely different opinions respecting the jurisdiction and competence of the Sanhedrim at the time of Christ and the apostles; how far, in fact, it may be said to have existed at all—save for a few matters of smallest importance—curtailed and circumscribed as it was by the Romans, who seem to have recognized only the 'high-priest;' and that collateral but most vital question, whether it was the Sanhedrim at all from whom emanated those well-known acts recorded in the New Testament. There can be no question as to its utter incompetence to arraign Christ for a 'crimen læsæ majestatis,' i. e., for high treason against the Roman emperor. No less difficult is the explanation of many of the proceedings against the apostles ascribed to this body. The suggestion, that the word Synedrion, as used in the New Testament, stands only for an arbitrarily convoked 'lynch-tribunal,' deserves more consideration than it has hitherto received.

SANHITA is the name of that portion of the Vedas which contains the Mantras or hymns. See VEDA.

SA'NITARY SCIENCE, known also under the names of PREVENTIVE MEDICINE, STATE MEDICINE, HYGIENE, and PUBLIC HEALTH, has been variously defined by different writers.* Dr. Mapother's is perhaps as good a definition as any. In the first of his *Lectures on Public Health*, he describes this science as 'an application of the laws of physiology and general pathology to the maintenance of the health and life of communities, by means of those agencies which are in common and constant use.' This department of science received so strong an impulse, about a quarter of a century ago, from the labors of Southwood Smith, Edwin Chadwick, Lyon Playfair, and others, that many persons regard it as of modern origin; and doubtless to a great extent they are right; but on turning back to the records of early history, we almost invariably find evidence that the health of the general population was a subject of legislation. The Mosaic code of laws—the most ancient on record—contains minute directions for the cleanliness of the person, the purification of the dwelling and the camp, the selection of healthy and the avoidance of unwholesome food (pork, for example, which in hot countries is more commonly found to harbor parasites than in temperate climates, and blood, which is the most putrescible part of the animal), the seclusion of persons with contagious disorders, the regulation of sexual intercourse at certain periods, and various other points bearing on the physical well-being of the Jewish nation. The Greeks and Romans, although not, like the Jews, making hygiene a part of their religious duties, were far from neglecting it.

'The Laws of Lycurgus,' says Dr. Gairdner, 'are not wanting in very pointed enactments on sanitary matters; and the importance attached by all the Greek republics, and in the Platonic ideal polity, to physical culture, is too well known to require remark. The Roman people, poor and apparently rude as it was in its origin, yet found time, amidst its military occupations, to construct the *Cloaca Maxima*, as an indestructible and stupendous memorial of its attention to the drainage and sewerage of the city at a very early period of its history. At a later period, aqueducts were made to cover miles upon miles of the surrounding plain; and their splendid ruins, still partly used for their original purpose, attest the munificence and the abundance with which the first of sanitary requisites was supplied to the imperial city.'—*Public Health in Relation to Air and Water*, 1862, p. 6. Moreover we know enough of the construction of the private houses and public buildings of the Romans to see that they recognized the necessity for free ventilation and good drainage. When the *Archiatri populares*, or state-physicians, were first appointed in the Roman Empire, is not certainly known. Their mode of election is described in the Theodosian and Justinian codes. There were ten of them in the largest towns; one to each district or subdivision; seven in towns of the second order; and five in the smaller ones. They collectively formed a college, whose duty it was to attend to the public health; and they may be regarded as the earliest type of our 'General Medical Council.' Gradually, however, as Christianity spread, an utter misconception of doctrine, led to the neglect of all care of the human body.

While the monks and friars devoted themselves to good works, feeding the hungry, clothing the naked, and instituting hospitals, they entertained no idea of the possible prevention of disease. They never attempted to impress upon their followers the importance of drainage, ventilation, pure and abundant water, &c.; but when an epidemic arose, it was supposed to be a manifestation of God's special anger; and it would have been impossible to make them understand that it was the natural result of a prolonged disregard of the laws of nature. Those who have read Dean Stanley's graphic *Memorials of Thomas A'Becket* will be inclined to wonder whether those who adopted such penances as his could ever be free from cutaneous disorders. The state of the towns in England in the 13th c. is so clearly described by Mr. Brewer in his Introduction to the *Monumenta Franciscana*, that we should have been glad to have extracted it, if our space had permitted. Those who have not access to the valuable series in which Mr. Brewer's work is included, will find a sufficient quotation from it in Dr. Gairdner's interesting volume on *Air and Water*, pp. 44—47. In another work in the same series—the *Liber Albus*, edited by Mr. Riley—much important information regarding the general sanitary state of London in the medieval times may also be found. In addition to the causes of disease indicated by these writers, such as the absence of drainage, the accumulation of filth, bad ventilation, insufficient and often unwholesome water, inattention to personal cleanliness, &c., must also be noticed the ordinary food in those times. The common vegetables of our own day, excepting the cabbage, were only slowly introduced from the time of Henry VIII. As turnips were not then used as a winter-food for oxen and sheep, these animals were with difficulty kept alive during the season when grass was scanty, and were therefore killed and salted in the beginning of the cold weather; and during several months, game and river-fish were the only kinds of fresh animal food.

Macaulay, in his celebrated third chapter on 'The State of England in 1685,' observes that, at that time, meat, although cheaper than in former times, was still so dear that hundreds of thousands of families scarcely knew the taste of it; that bread such as is now given to the inmates of work-houses was then seldom seen even on the trencher of a yeoman or of a shopkeeper; and that the great majority of the natives lived almost entirely on rye, barley, and oats. Many important facts of a similar nature are also recorded in Froude's *History of England*.

During the 18th c., many important steps were taken for the improvement of the public health. Under a proper system of drainage, ague became eradicated from extensive fenny districts; and with a knowledge of the therapeutic properties of cinchona bark and arsenic, we can cut short the disease when it appears. Scurvy* was all but blotted out of the list of diseases that proved most fatal to our sailors; and vaccination, incomparably the greatest discovery yet made in this department of science, was the crowning achievement of the century.†

The first outbreak of cholera in this country in 1832, lamentable as it was in itself, was productive of much benefit in directing the public mind to the all-important subject of the prevention or repression of disease. It was impossible to ignore the fact that, while the poor, dwelling in unventilated and undrained hovels, fell victims to this new and ill-understood disease in thousands, the middle and higher classes were comparatively safe. All investigations into the dwellings and domestic habits of the lowest class of the population revealed a condition of things of which the general public had no conception. A new poor-law was consequently passed in 1834, and a commission was appointed to investigate and report upon its working. The *Report on the Sanitary Condition of the Laboring Population of Great Britain*, published in 1842, and mainly treating of the sanitary state of the poor and of the character of their dwellings, may be regarded, as Professor Gairdner ‡ well observes, as 'the true starting-point of modern sanitary legislation.' A 'Health of Towns' Commission,' which was soon after appointed, gave in two valuable Reports in 1844 and 1845; and subsequently, a Metropolitan Sanitary Commission published Reports in the years 1847 and 1848. These Re-

* As the state of Sanitary Science, both in principles and practice, is substantially what it was when this exhaustive account of the subject was written by the late Dr. Day, the article has been allowed to stand without any material alteration.

* We regret to state that during the last few years scurvy is again becoming prevalent in the mercantile service, and occasionally amongst navvies engaged at places where good food was not easily attainable. In both cases, it may always be traced to neglect of due dietetic precautions.

† And yet, in consequence of vaccination being either neglected or imperfectly performed, no less than 51,034 persons died in Great Britain from small-pox in the ten years, 1856—1865. In the year 1864 alone, the deaths were 9425. On this subject, see Sir James Y. Simpson's 'Proposal to stamp out Small-pox, &c.,' in the *Medical Times and Gazette* for January 4, 1868.

‡ *Public Health in Relation to Air and Water*, p. 17.

ports will form a lasting memorial of the labors of Mr. Chadwick and his able co-operators. Nor, in this rapid glance at the history of sanitary science, can the name of Dr. William Farr be omitted, who—again to quote Dr. Gairdner's words—'found the facts of this science in a state of almost hopeless and aimless confusion, and has not only added immensely to their number and value, but has brought into them light, harmony, order, and, for the first time in the history of the science, a determinate method, and an approach to scientific exactness.' By his system of calculating death-rates, he has placed an easy and useful method at the service of his professional brethren, while, by the formation of life-tables, he has greatly facilitated the operations of life assurance.

We now pass on to the consideration of the most important sanitary agents, beginning with AIR. Under this head, we have to consider (1) the amount of air necessary for the full performance of the respiratory process; (2) the means of ascertaining when air is impure, or, if impure, what substances are mixed with it; (3) the means of purifying contaminated air; and (4) the diseases due to deficiency in the quantity, and alterations in the quality of the air.

(1) The *first* question can be answered both by calculation and experiment. By calculation, Dr. Parkes finds that 2082 cubic feet of air must be supplied per head per hour, so to dilute the products of respiration and transpiration from the sound body, as to keep the air always pure and fresh (see his *Manual of Practical Hygiene*, 1864, p. 65). From numerous experiments in which the outflow of air was measured, and the carbonic acid simultaneously determined, he found that at least 2000 cubic feet per hour must be given to keep the carbonic acid at its normal level of ·5 or ·6 in 1000 volumes, and to remove the *odor humanus* or fetid smell of animal matter. General Morin, in his *Rapport de la Commission sur le Chauffage et la Ventilation des Bâtimens du Palais de Justice*, 1860, gives results in close accordance with those of Parkes, assigning the following as the relative hourly amounts of fresh air (expressed in cubic feet) per head in temperate climates: in barracks, at 1059 by day, and 2118 by night; in workshops, prisons, and theaters, 2118; in schools, 1059; and in hospitals, 2825, increased to 4236 during the hours of dressing the surgical cases, and 5650 during epidemics.* In mines, if it is wished to keep up the greatest energies of the men, 6000 feet of air per hour must be allowed. It may be incidentally mentioned that a horse requires 2460 feet per hour at the least.

It is difficult to lay down any rules regarding the amount of fresh air required in sickness. The vitiation of the air by the products of combustion of gas, candles, lamps, &c., must not be overlooked. For every cubic foot of gas that is burned, 1800 cubic feet of air are required to keep the air pure, unless the gaseous products are carried off in a special channel, such as is now frequently attached to gas-fittings. A pound of oil burned in a lamp may be regarded as equivalent to 10 cubic feet of gas, so far as the deterioation of the air is concerned. (For these facts, we are indebted to Dr. Parkes.)

(2) The composition of pure air is sufficiently described in ATMOSPHERE. The impurities in air may be divided into: (*a*) suspended matters, (*b*) gaseous substances, and (*c*) special impurities. Amongst *suspended matters* are, according to Pasteur and others, numerous and universal germs of organic beings, both animal and vegetable, as of vibriones, bacteria, and monads; pollen, spores of fungi, mycoderms, mucedones, &c. Minute particles of finely comminuted inorganic matter are also often taken up by currents of air, and remain in suspension. These are probably altogether harmless. The works of man more seriously affect the air in a hygienic point of view. Particles of coal and of half-burned carbon (smuts), starch-cells (from bakeries and bread), and, when certain trades are carried on, cotton fibres, hairy particles of wool, of stone, of iron, &c., may, when constantly inhaled, give rise to the production of special diseases of the lungs and stomach. In the air of badly-kept hospital wards, pus-cells and epithelial cells are often to be detected.

Most physicians now believe that the specific poisons of small-pox, scarlet fever, and measles, which are derived from the skin and mucous membrane, consist of molecular organic matter, which, although as yet undetected, must pass into the air; and the same remark applies to the so-called germs of typhoid fever (see the article on TYPHUS AND TYPHOID FEVERS) and cholera, which are thrown off by the intestinal mucous membrane, and subsequently become dried and capable of aerial suspension. Amongst *gaseous matters*, which merely pass into the atmosphere either from natural causes or manufactories, are various compounds of carbon, sulphur, chlorine, nitrogen, and phosphorus, with oxygen and hydrogen, which it is unnecessary here to enumerate. Besides the gases formed by the union of the above-named elements, we must notice organic vapor from decomposing animal matters and sewers, which last has been found by Odling to be carbo-ammoniacal. Amongst *special impurities*, those caused by respiration are the most important. An adult man, under ordinary conditions, gives off, in 24 hours, from 12 to 16 cubic feet of carbonic acid by the lungs, and a certain additional quantity, not determined, by the skin. Watery vapor, ranging from 25 to 40 ounces, also passes off daily from the skin and lungs, together with an undetermined quantity of organic matter, which is partly suspended (as particles of epithelium, &c.), and partly made up of organic vapor. This vapor, when collected and condensed from a large volume of respired air, is found to be nitrogenous, and has a very fetid smell. Here there is a most powerful source of vitiation, regarding which numerous chemical analyses have been made; for details regarding which we may refer to Parkes, *op. cit.* pp. 70—77; Gairdner, *op. cit.* p. 69; and Mapother's *Lectures on Public Health*, 2d ed., pp. 40—61.

There is a condition of the atmosphere to which various observers, and especially Pasteur, have directed attention, which requires a passing remark. It is what may be termed the fermentative condition, and depends upon the universal presence in the air of countless germs of vegetables and infusoria. It is possible that this atmospheric condition may be concerned in some of the zymotic diseases. Dr. Salisbury, an American physician, endeavors to show that the poison of measles is due to a fungus which grows on rotten straw; another American physician, Dr. Flint, 'has almost fully demonstrated that the spores of palmella cause ague.'—Mapother, *op. cit.*, p. 431, &c. The presence of a *cholera-fungus*, which has been recently proved to exist in the evacuations of all cholera patients, gives as will be seen from Mr. Simons's Report of the Weimar Conference,* a hint as to the probable cause of that disease. Bearing on the same subject is the fact, lately noticed by Davaine, that the splenic apoplexy of sheep is owing to the presence of bacteria in the blood, and that sheep, rabbits, and horses can be inoculated by transferring into their circulation the bacteria, which are extremely thin rod-like organisms, varying in length from $\frac{1}{6000}$th to $\frac{1}{2000}$th of an inch. The same observer has just found (as we learn from the 'Parisian Medical Intelligence,' in the *Lancet* for January 4, 1868) that bacteria are to be found in all carbuncular diseases of any form whatever; that the supervention of these little beings in the spleen, the lungs, and the blood, precedes the occurrence of morbid phenomena; and that the carbuncular blood ceases to be contagious as soon as the bacteria have disappeared; and hence he feels justified in regarding them as the cause of carbuncle.

Another French observer, M. Poulet, has just detected myriads of infusoria (*monas termo* and others) in the breath exhaled in whooping-cough. If one contagious disease can be proved to be connected with the germs occurring in the air, it is almost a certainty that similar diseases must arise from corresponding causes.

(3) The natural means of purifying the atmosphere are diffusion, oxidation, the action of winds, and the fall of rain. In cases where the air is specially impure, as in sick-rooms where there are contagious cases, the agents commonly known as *Disinfectants* (q. v.), or *deodorants*, are employed. Amongst the *solids* of this class are charcoal (see WOOD-CHARCOAL), dried earth, and the carbolates of lime and magnesia. Amongst the *liquids*, those in highest reputation are *Condy's Fluid*† (consisting of an alkaline permanganate, which at once decomposes ammoniacal compounds, and destroys organic matter rapidly) and carbolic acid: whilst amongst the *gases* or *vapors*—which are the most powerful means of purifying the atmosphere, next to ventilation—may be especially mentioned chlorine, nitrous acid, and sulphurous acid; of these, says Dr. Parkes, the nitrous acid is probably the most powerful, but it is useful to employ all three alternatively, or even together. It must be recollected that all these agents are mere auxiliaries to ventilation, the primary importance of which must never be forgotten.

(4) Abundant experience confirms the view which might have been *a priori* inferred from the study of the physiology of Respiration (q. v.), that the breathing of impure air must be incompatible with perfect health. The special impurities which are worthy of notice as being causes of disease, or of an impaired state of health, are arranged by Dr. Parkes as follows: (*a*) Suspended matters; (*b*) Gaseous matters; (*c*) Impurities from several substances always co-existing.

(*a*) *The suspended matters* which are known to occasion disease in various trades, are very numerous. Thackrah, in his well-known work on *The Effects of Arts, Trades, and Professions on Health*, published in 1832, gives the following list of workmen who were injuriously affected by the dust of their trades: Corn-millers, maltsters, tea-men, coffee-roasters, snuff-makers, paper-makers, flock-dressers, feather-dressers, shoddy-grinders, weavers of coverlets, weavers of harding, dressers of hair, hatters employed in the bowing department, dressers of colored leather,

* The older observers fixed the necessary quantity of fresh air far too low: Peclet thought 212 feet sufficient; Arago, 353 feet; and Dr. Reid, 600 feet per hour.

* *Ninth Report of the Medical Officer of the Privy Council* (1866), pages 29 and 515.

† It may interest some of our readers to know that by washing the cavity of the mouth with a very weak solution of Condy's Fluid, the odor of tobacco is instantly removed.

workers in flax, dressers of hemp, some workers in wood, ware-grinders, masons, colliers, iron-miners, lead-miners, grinders of metals, file-cutters, machine-makers, makers of fire-arms, and button-makers. Colliers suffer from lung disease in ill-ventilated mines; and to the list above given must be added potters, especially the class called *flat-pressers*, in whom emphysema is so common that it is known as 'the potters' asthma;' the china-scourers, who all, sooner or later, become asthmatical from inhaling the light flint-dust in suspension; pearl button-makers and pin-pointers, who suffer from bronchitis and hæmoptysis; the makers of grinding-stones; the makers of Portland cement, &c. In some trades, irritant vapors are more or less associated with suspended particles in causing disease. Brass-founders suffer not only bronchitis and asthma from the inhaled dust, but also a special disease, described by Dr. Greenhow (in the *Proceedings of the Medico-Chirurg. Soc.* vol. 4) as Brassfounders' Ague, which is apparently produced by the inhalation of the fumes of oxide of zinc; the symptoms being oppression of the chest, with indefinite nervous sensations, followed by shivering, a hot stage, and profuse sweating. Coppersmiths and tin-plate workers are liable to somewhat similar attacks. Plumbers, house-painters, manufacturers of white-lead, &c., are, as is well-known, liable to lead-poisoning.

The peculiar affection to which workers in mercury and its amalgams, as silverers and water-gilders, are exposed, is described in the article PARALYSIS, under the name of *Mercurial Tremor*, or *The Trembles*. In the various trades in which arsenical compounds are employed, as in making artificial flowers, green paper for walls, &c., preparing arsenical pigments, &c., the well-known symptoms of chronic arsenical poisoning are likely to ensue. On the subject, Dr. Guy has, at the request of government, drawn up an elaborate Report.

Passing from inorganic or unorganized matter to organic substances floating in the atmosphere, and giving rise to a large class of important diseases, we may remark, that it still remains to be decided in what exact condition this organic matter exists—whether it is in the form of impalpable particles, or moist or dry epithelial or pus cells; 'and whether it is always contained in the substances discharged or thrown off from the body (as is certainly the case in small-pox), or is produced by putrefactive changes in these discharges, as is supposed to be the case in cholera and dysentery, is also a matter of doubt. But, from the way in which, in many cases, the organic substance is absorbed by hygroscopic substances, it appears that it is often combined, or at anyrate condensed, with the water of the atmosphere.'—Parkes, *op. cit.*, p. 86. This much is known with certainty regarding the specific poisons—viz., that they differ extremely in the readiness with which they are oxidized and rendered harmlesss. While typhus and oriental plague throw off a poison, which, if there is due ventilation, is readily destroyed, the poisons of small-pox and scarlatina spread in defiance of free ventilation, and retain their virulence for weeks or months.

(*b*) The most important *gaseous matters* in the air likely to produce disease are *carbonic acid* and *carbonic oxide*. The normal quantity of carbonic acid in the air being regarded as ·5 in 1000 volumes, 'it produces fatal results when the amount reaches 50 per 1000 volumes; and at an amount much below this, 15 or 20 per 1000, it produces in some persons, at anyrate, severe headache.' Dr. de Chaumont, assistant Professor of Hygiene at Netley, has published a valuable paper in the *Lancet* for September 1866, in which he shows how the amount of air necessary to reduce the carbonic acid of respiration to a given standard could be calculated; and in the *Edinburgh Medical Journal* for May 1867, he has given extended formulæ for calculating most of the problems connected with ventilation. Amongst the most important of his conclusions are the following: (1) We cannot safely accept a lower standard of purity than ·06 per cent. of carbonic acid. (2) Uniform diffusion being supposed, we cannot preserve this standard with a less delivery of fresh air than 3000 cubic feet per head per hour. (3) We must provide an air space which will admit of the delivery of 3000 cubic feet per head, and at the same time preclude the necessity of changing the whole air so often as six times per hour, for which condition a minimum of 1000 cubic feet is absolutely necessary.* *Carbonic oxide* (q. v.), which is often developed in association with carbonic acid, is far more actively poisonous than carbonic acid.

An atmosphere containing ½ per cent. killed small birds in three minutes; and when 1 per cent. was present, they died in half this time (Letheby). For the effect of other gaseous matters, as sulphuretted hydrogen, carburetted hydrogen, sulphurous acid gas, hydrochloric acid, &c. we must refer to any of the more elaborate works on this subject.

* A committee, of which Sir T. Watson was president, recently appointed by the Poor-law Board to consider the question of the amount of cubic space necessary for the sick in workhouse infirmaries, report that for ordinary patients 850, for offensive cases, 1200, and for fever patients 3000 cubic feet should be allowed. Although these spaces are greater than we find in most workhouses, it is obvious from the statements in the text that they are not sufficient.

(*c*) The *impurities from several co-existing agents* next claim attention. In point of fact, these are the impurities with which we have practically almost always to deal, and it is very probable that a knowledge of the action, of two or more isolated noxious agents might lead us to very incorrect conclusions regarding the composite effect that is actually produced. When air is vitiated by respiration, it is popularly believed that the carbonic acid gas is the chief poisonous agent; and that the fatality in such well-known cases as the Black Hole (q. v.) of Calcutta, the prison in which the Austrians were placed after the battle of Austerlitz, the steamer *Londonderry*, &c., is simply due to the action of this gas. The true poisonous agencies in these instances are the organic matter, which is always found in air rendered fetid by the prolonged respiration and cutaneous exhalation of a crowd of human beings, and the deficiency of the oxidation, and the consequent increase of putrescent matter in the body (see Carpenter's *Human Physiology*, 1864, p. 304). Putting aside these extreme cases, which are of rare occurrence, we have abundant evidence in the Reports of the Health of Towns Commission, and elsewhere, that the continuous inhalation of an atmosphere moderately vitiated from respiration has an injurious effect on the health. The aëration of the blood is imperfectly effected, and the nutrition generally is more or less interfered with.

Although impure air has long been vaguely regarded as a cause of phthisis, it is only during the present century that the fact has been placed on unquestionable authority. It may now be regarded as established, that not only phthisis but other lung-diseases may have their origin in breathing an atmosphere contaminated by respiration. The subject is one of such vital importance that we shall adduce the very strong evidence of Dr. Parkes, who most distinctly proves that the prevalence of phthisis amongst our troops is in a direct ratio to the impurity of the air in the barracks. 'A great amount of phthisis used to prevail,' he observes, 'in the most varied stations of the army, and in the most beautiful climates: in Gibraltar, Malta, Ionia, Jamaica, Trinidad, Bermuda, &c., in all which places the only common condition was the vitiated atmosphere which our barrack-system everywhere produced. And as if to clench the argument, there has been of late years a most decided decline in phthisical cases in these stations, while the only circumstance which has notably changed in the time has been the condition of the air. So also the extraordinary amount of consumption which prevails in the men of the royal and merchant navies, and which, in some men-of-war, has amounted to a veritable epidemic, is in all probability attributable to the faulty ventilation.'—*Op. cit.*, pp. 91, 92. A considerable amount of evidence in support of this view is afforded by comparative pathology. The extraordinary mortality of phthisis amongst the inhabitants of the old monkey-house in the Zoological Gardens, was found to be due to overcrowding and bad ventilation; and now, in their present airy residence, the inhabitants are no longer prematurely cut off. The overcrowding to which cows in large towns are subjected leads to the great amount of pulmonary disease amongst these animals; while horses, which in the worst stables have more free air than cows, rarely suffer. Not only are pulmonary affections induced by the prolonged respiration of air partially vitiated by organic exhalations, but such an atmosphere seems to favor the spread of several well-known specific diseases, as typhus, plague, small-pox, scarlatina, and measles.

Hitherto, we have simply considered the effect of breathing an atmosphere vitiated by the exhalations given by persons in ordinary health; if we now pass to the consideration of the air of a crowded hospital-ward, we shall find the organic matter not only more abundant, but at the same time far more noxious. The convalescence of patients is much retarded by their being kept in such an atmosphere (see CONVALESCENT HOSPITALS.) When the air has absorbed a certain amount of organic impurity, its respiration is very likely to give rise to erysipelas and hospital gangrene. *Sewers* and old *cesspools*, when opened, give off *sewage-gas* containing carbonic acid, sulphuretted hydrogen, sulphide of ammonium, and putrid organic vapor. A case is given in the first volume of the *Health of Towns Report*, which forcibly illustrates this fact. When a privy connected with a school at Clapham was cleaned out, 23 of the children were seized with violent vomiting and purging, headache, great prostration, and convulsive muscular twitchings; and 2 of them died within 24 hours. Sewer-men are more liable to typhoid and typhus fever than any other persons; but night-men and scavengers do not seem liable to any special disease. The effect of diluted sewer-gas from bad drainage, on the health of the population at large, is a distinct question, into which we have not space to enter, further than to remark that typhoid and diarrhœa are commonly induced by the escape of this gas through our drains and water-closets into our houses. The effects of the impurities arising from manufactories of various kinds, are of course extremely varied; and the subject is so extensive a one that it must be touched upon very briefly.

Sulphurous and sulphuric acid are given off from vitriol and copper-smelting works; hydrochloric acid from alkali-works;

arsenical fumes and sulphurous acid from copper and lead smelting furnaces; carbonic acid and carbonic oxide from cement-works, &c. Soap and candle manufactories, if not well superintended, yield various gases of a rancid smell, and even that powerful irritant, acroleine. Gas-works in which the wet-lime process of purification is adopted, often evolve sulphuretted hydrogen to such a degree as to become a nuisance injurious to health. Manure-works usually evolve more or less disgusting smells according to the basis operated on, and the mode of preparation. No bad effect on the health has, so fas as we know, been observed in this country, from the gases given off by such works, and the exhalations from the manufactories of *poudr tte*, which is dry fæcal matter, are positively declared, by several of the highest French authorities, to exercise no injurious action either on man or vegetation; but the eminent French hygienist, Parent Duchâtelet, relates two cases in which poudrette underwent fermentation on board ship; and in one of these cases, the vessel lost half her crew (number not stated); while in the other, all on board (five) suffered from intense headache, pain in the limbs, vomiting, prostration, and (in two cases) diarrhœa. The *air of old graveyards*, when they are disturbed, often gives rise to epidemics of fever; but the effect of the effluvia of comparatively recent putrefying human bodies is much more decided. Numerous cases are recorded of asphyxia and various forms of fever arising from the exhumation and disturbance of bodies. How far the effluvia arising from *slaughter-houses* and *knackeries* are injurious to health, is an open question.

There is very strong general evidence that the men employed at Montfaucon (where, however, the ventilation is excellent, and no putrid matters are allowed to remain) enjoy good health; and Tardieu, from a late re-examination of the point, confirms the old conclusion, except so far as glanders and malignant postule are concerned. The danger of breathing the *air of marshes* also requires notice. Malaria seems not only to occasion intermittent and remittent fevers, but diarrhœa and pure dysentery. Organic matter to the amount of eight grains has been obtained from 1000 cubic feet of air collected over marshes; and it is worthy of notice that it has just the same chemical characters as the organic matter exhaled from the lungs, turning red with nitrate of silver, yielding ammonia when treated with lime, and blackening sulphuric acid when drawn through it. See Mapother, *op. cit.*, p. 87.

The next point to be considered is the means to be adopted for continually changing the air, so as to keep it in its natural purity. We have already shown that this change must amount to at least 2000 cubic feet per head per hour for persons in health; and sometimes double that amount, or more, for sick persons. The general principles of ventilation having been treated in the article on WARMING AND VENTILATION, we shall confine ourselves here to a few supplementary observations. In whatever way the fresh air is supplied, there are several essential conditions to be observed, of which the following, as stated by Dr. Parkes, deserve special notice: (1) 'The *entering air* must itself be pure. It must be warmed if too cold, and cooled if too warm. (2) Its movements should be imperceptible, otherwise it will cause the sensation of draught, and will chill.

'The rate at which the movement becomes imperceptible is 1½ feet per second, or 1·36 miles per hour; 2 and 2½ feet per second, or 1·4 and 1·7 miles per hour, are imperceptible to some persons; 3 feet per second, or 2 miles per hour, is perceptible to most; 3½ feet is perceived by all persons. Any greater speed than this will give the sensation of draught, especially if the entering air be of a different temperature, or moist. (3) It must be well diffused all through the room, so that in every part a movement shall be going on—in other words, the distribution must be perfect. (4) The *outgoing air* must be removed so immediately that there shall be no risk of a person breathing again either his own expired air or that of any other person.'—*Op. cit.* p. 103. The *action of the wind* is a powerful ventilating agent. If it can pass freely through a room with open doors and windows, it changes the air to an extent that can be effected in no other way. The most serious objection to winds as ventilating agents by perflation is the uncertainty of their movement, and the difficulty of its regulation. When the velocity reaches 4 miles, it is found unpleasant by most people and is therefore either excluded, or only admitted through small openings, when it fails to become properly distributed. For the various ways in which the perflative power of the wind has been employed in systems of ventilation, we must refer to Ritchie's *Treatise on Ventilation*. 1862; Tomlinson's *Treatise on Warming and Ventilation;* and to the chapter on that subject by Dr. Parkes, who gives a diagram illustrating the mode in which Dr. Arnott has most successfully ventilated the Field Lane Ragged Schools. In the ventilation of ships, the wind is always used, the air being directed between decks and into the hold by means of wind-sails or tubes with cowls turning towards the wind.

A description of Dr. Edmond's plan of ventilation, which is now commonly used in emigrant ships, and as being adopted in the royal navy, is given in a recent article in *The Lancet*, on 'The Medical Aspects of the Abyssinian Expedition.' 'In all cases,' says Dr. Parkes, 'in which the air of a room—as in a basement story or in the hold of a ship, perhaps—is likely to be *colder* than the external air, and where artificial means of ventilation cannot be employed, the wind should be taken advantage of as motive agent.' In artificial ventilation by a fan or screw, it is a question which of the two methods should be employed—the method of *extraction*, in which the air is drawn out of a building or room; or the method of *propulsion*, in which air is driven in, so as to force out the air already in the room. Both plans have advocates of authority. The advantages of the method of propulsion are its certainty and the ease with which the amount may be altered. The stream of air can be taken from any direction, and can be washed, cooled, or warmed at pleasure. The fan or wheel commonly used in propulsion is essentially that proposed by Desaguliers in 1734; it is figured in article BLOWING-MACHINES (figs. 7, 8). The following is the way in which it is applied to one of the largest rooms in this country—St. George's Hall, at Liverpool. The air is taken from the basement; is washed, by being drawn through a thin film of water, thrown up by a fountain; is passed (in cold weather) into vessels for the purpose of warming it, in which it can be moistened by a steam-jet, if the difference of the dry and wet bulb be more than five degrees, and is then propelled along the channels which distribute it to the hall. In summer, it is cooled in the conduits by the evaporation of water. This system is employed with success in various hospitals, asylums, &c. in France and America; and during the Crimean war, Mr. Brunel introduced into the hospital of Renkioi a wheel of Desaguliers' at the entrance of each ward of 50 beds, which was worked by hand, and could throw 1000 cubic feet of air into the ward every minute.

For information regarding the best means of keeping the air of rooms at the most fitting temperature, we must refer to the article WARMING. The degree of artificial warmth that should be given to the air varies according to circumstances. Healthy adults, who are well fed and clothed, usually find any temperature from 50° to 60° comfortable; while children and aged persons require a temperature of 65° to 70°. In hospitals, the proper temperature is usually supposed to be about 60°; but in those diseases in which there is preternatural heat, except possibly in scarlatina, a lower temperature—as from 50° to 45°, or even 40°—is more expedient. In most febrile cases, in the acute stage, cold air moving over the body is very efficacious as a cooling agent.

The next sanitary element to be considered is WATER. The *daily quantity* of water for healthy and sick persons is the first point for consideration. Water is required by healthy persons (1) *For drinking.* A man weighing 10 stone will take on an average from 70 to 90 ounces of water in 24 hours, of which 30 or 40 ounces are taken imperceptiby in the solid food, while the remaining 50 or 60 ounces are taken in a liquid form. But the amount varies extremely. The usual allowance on board ship for both drinking and cooking is 8 pints per adult daily. (2) *For cleansing the person, clothes, and habitations.* Dr. Parkes estimates 4 gallons per head daily as the smallest amount; and if perfect cleanliness is to be secured, and baths* are taken, at least 16 gallons per head are required. (3) *For sewage*, an additional 9 gallons must be added. The amount for a water-closet varies with its construction. At Netley Hospital, to which Dr. Parkes is physician, Jenning's closets are used, which require 10 gallons per head daily.

It may be of importance to many of our readers to know that a horse drinks from 8 to 12 gallons daily, and ought to have 3 or 4 more for grooming purposes; a cow or small ox drinks from 6 to 8 gallons; and a sheep or pig, from 2 quarts to 1 gallon.

The different *sources* of water—rain-water, rivers, and springs; the chief impurities in these waters; the methods of detecting them; and the modes of purifying bad water, are so fully described in the article WATER-SUPPLY that we have scarcely anything to add on these points. The *organic matters* in different waters used for drinking purposes require, however, a few additional remarks, on account of their extreme importance in a hygienic point of view. To the remarks on this subject in another part of this volume, we may add that their amount varies from 0·3 per gallon to as much as 12 or even 30 grains per gallon, the purest waters in this respect being those from granitic, or clay-slate, or chalk districts. The most common organic matter is derived from the vegetable kingdom, and consists of humin and ulmin, and of acids derived from humus; all which substances are non-nitrogenous, although the acids combine readily with ammonia. This form of organic matter is far less dangerous than that which has an animal origin, and contains nitrogen. This organic matter is usually derived from the contents of cesspools or sewers percolating into springs. Its exact composition is not known. Fæcal and biliary matters doubtless contribute to the composition of this matter; and in addition, decomposed flesh, as the refuse of butch-

*A general bath requires about 50 gallons; a shower-bath at least 6 gallons; and a hip-bath from 12 to 18 gallons.

ers' shops and slaughter-houses—substances from tripe-manufactories and gut-spinners, from size, horn, and isinglass manufactories, &c., often contribute to the organic matter of well and spring water. See Parkes, *op. cit.*, p. 12. Most of these substances, in decomposing, produce both nitrous and nitric acid and ammonia; and the nitrites and nitrates thus formed unfortunately not only do not communicate any bad taste or smell to the water, but actually tend in many cases to render it especially palatable. The use of water of this kind is liable to produce diarrhœa and choleraic symptoms.

The characters of good drinking-water—as laid down after much discussion by various sanitary congresses—are summed up by Dr. Parkes as follows: 'It must be transparent, colorless, without odor, and tasteless; it should be well aërated (as it then appears to be more easily absorbed), cool, and pleasant to drink; it must have no deposit; vegetables should be readily cooked in it; the total dissolved constituents must be within a certain amount, which, with some limitation, may be represented by the following numbers: organic matter should not exceed 1·5 grains per gallon; carbonate of lime, 16 grains; sulphate of lime, 3 grains; carbonate and sulphate of magnesia, 3 grains; chloride of sodium, 10 grains; carbonate of soda, 20 grains; sulphate of soda, 6 grains; and iron, 0·5 of a grain.'

For details regarding the mode of examining water with the view of ascertaining its value for drinking purposes, we must refer to any of the leading works on Practical and Analytical Chemistry, and an especial reference may be made to Professor Miller's recent Memoir on Potable Water, and to Dr. Parkes's section on the examination of water. To the substances named in the article on WATER-SUPPLY, as purifying water from organic matter, we may add the following: (1) *Permanganate of potash*, commonly known as Condy's Fluid, which decomposes organic matter and ammoniacal compounds by rapid oxidation. A physician who has had long experience on board Australian emigrant-ships informs us that he has often added a small quantity to the water which, when drawn from the casks, was almost undrinkable, with the effect of at once rendering it totally inoffensive. (On this subject, Condy's *Air and Water, their Impurities and Purification*, may be read with advantage.) (2) *Strychnos potatorum*, which is used in India to purify water; the nut being rubbed on the inside of the casks. (3) Certain vegetables containing *tannin*, as tea,* kino, the Laurier rose (in Barbary), and bitter almonds (in Egypt).

The consequences of an *insufficient* and *impure* supply of water are deserving of the most serious consideration. The Reports of the Health of Towns Commission (1844 and 1845) contain much information on the first of the subjects; while the Reports of the Medical Officer of the Privy Council abound in facts relating to the second subject. We find that an insufficient supply leads to the person and clothes not being washed at all, or being repeatedly washed in the same water; to water for cooking being repeatedly used; to imperfect cleansing of houses and streets; to the sewers becoming clogged, and the air thus rendered impure. The natural result is—as in the case of a deficiency of pure air—a depressed condition of the general health, with a tendency to skin-diseases, ophthalmia, &c.; while the imperfect cleansing of the sewers favors the spread of typhoid fever and of choleraic diarrhœa. We are indebted more perhaps to Mr. Simon's valuable Reports than to any other source for the knowledge that a continually increasing class of cases is found to be connected with the use of impure water, the principal noxious ingredients being animal organic matter, especially when of fæcal origin; vegetable organic matters, when derived from marshes; and some salts, except when in very small quantities, as sulphates of lime and magnesia, chlorides of calcium and magnesium, nitrates and nitrites of ammonia, &c.

The *alimentary mucus membrane* is especially liable, he supposes, to be affected by impure water. Thus, dyspepsia, with such symptoms as partial loss of appetite, uneasiness or pain in the pit of the stomach, nausea and constipation, with occasional diarrhœa, may be caused by water containing certain quantities (probably about eight grains each per gallon) of sulphate of lime, chloride of calcium, and the magnesian salts. *Diarrhœa* may be caused by the use of many of the great North American rivers, the Ganges, &c., where much clay is held in suspension. Water contaminated with sewage, and containing suspended animal and especially fæcal matter, is a common cause of an outbreak of this affection, and even of choleraic symptoms. Dissolved animal organic matters doubtless have a similar effect, but it is difficult to distinguish between the actions of these and of suspended organic matters. Amongst other impurities known to occasion diarrhœa are fetid gasses (sulphuretted hydrogen), an excess of dissolved mineral matters and nitrate of lime; and on most persons, brackish water acts similarly. The effects which the selenitic well-waters of Paris exert on strangers are well known. There is abundant evidence to show that impure water is one of the principal causes of *Dysentery*. The records of our army surgeons abound in illustrative cases. The deleterious effect of the impure water of Calcutta in inducing dysentery has been forcibly pointed out by Dr. Chevers in the *Indian Annals* for 1864.

In addition to the diseases affecting the alimentary mucous membrane of the intestines, there are certain *specific diseases* which result from the use of impure water, as *Malarious Fevers* of various forms, from the use of the water of marshes; *Typhoid Fever*, from water contaminated with sewage matters, or the special typhoid poison; *Cholera*, from water into which cholera-evacuations have made their way; and possibly *Yellow Fever*. (The relation of impure water to typhoid fever and cholera will be more fully noticed in a later part of this article). To the use of water unfit for drinking purposes are also ascribed epidemic boils from the presence of sulphuretted hydrogen; disease of the bones, as exostosis, from an excess of carbonate and sulphate of lime; calculi (on, we think, insufficient evidence); goitre, from water derived from limestone and magnesian rocks; and entozoa of various kinds. Dr. Parkes sums up the department of his *Manual* which treats of water in a hygienic point of view with the following practical conclusion: '(1) An endemic of diarrhœa *in a community* is almost always owing either to impure air, impure water, or bad food. If it affects a number of persons suddenly, it is probably owing to one of the two last causes; and if it extends over many families, almost certainly to water. (2) Diarrhœa or dysentery constantly affecting a community, or returning periodically at certain times of the year, is far more likely to be produced by bad water than by any other cause. (3) A very sudden and localized outbreak of either typhoid fever or cholera is almost certainly owing to the introduction of the poison by water; and the same fact holds good in cases of malarious fever. (4) The presence of lumbrici, guinea-worm, or *Bothriocephalus latus*, should always excite suspicion of the drinking and bathing water.'—*Op. cit.*, p. 63.

After the two most important factors in relation to health, viz., air and water, SOIL and CLIMATE occupy a secondary, although by no means unimportant place. As their practical bearing is less direct and universal, we will dismiss them briefly. *Soil* may affect health (1) by its conformation and elevation. Thus, amongst hills, the unhealthy spots are enclosed valleys, where the air must stagnate, and ravines. On plains, the most dangerous spots are at the foot of hills which store up water, unless a ravine cuts off the drainage. (2) Vegetation exerts an important influence. If we regard vegetation as divisible into herbage, brushwood, and trees, it may be laid down as a general rule, that herbage is always healthy, and in the tropics, is of great importance in cooling the ground, both by obstructing the sun's rays and by aiding evaporation; that brushwood is almost always bad, but that its removal may cause a temporary increase of malarious disease, on account of the disturbance of the soil; and that trees should seldom be removed, unless they decidedly interfere with the movement of the air, for in cold countries they shelter from cold winds—in hot, they cool the ground—and in both they may afford protection from malarious currents. The present condition of St. Thomas in the West Indies, which is now one of the most pestilent sites we are acquainted with, is mainly due to the insane destruction of its trees. The island of Mauritius, which has lately been visited by one of the most universal and destructive forms of fever ever recorded, has similarly suffered from the same cause. (3) The mechanical structure of the soil is of hygienic importance in various points of view. Thus, *heat* is very differently absorbed by different soils under the same conditions of exposure. Assuming that sand with a little lime has the maximum power of retaining heat, and that its capacity be represented by 100, then the capacity of clay will range from 76·9 to 66·7; while that of chalk will be 61·8, and that of humus as low as 49. Hence, we see the comparative coldness of the latter soils as compared with sand. The capacities of these soils for absorbing and retaining moisture are in the reverse order.

As a general rule, there seems to be the following connection between the geological characters of a site and its probable healthiness. *Granitic*, *Metamorphic*, and *Trap Rocks* are usually healthy: there is generally a slope, so that water runs off readily, the air is dry, vegetation moderate, and drinking-water generally good. They are, however, supposed to be unhealthy when they have become disintegrated, as at Hong-Kong, into a dark-colored soil. *Clay-slate rocks* are regarded as healthy, for very similar reasons; water, however, is often scarce. Of the varieties of *Limestone Rocks*, the hard oolite is the best and the magnesian (which, if possible, should always be rejected as a site) the worst. *Chalk*, when unmixed with clay, forms a very healthy soil; but if it be mixed with clay, it loses its permeability, and is often damp and cold. The air is pure, and the water, though hard, is clear, sparkling, and pleasant. The *Sandstones*, if permeable,

* The water of the Peiho and other rivers in the north of China is so impure, and has so offensive a smell during winter, that the Chinese never drink it except as tea, when it seems to lose all its bad effects. It is only by using their 'brick-tea' to purify the water of the steppes, that the Tartars render the water drinkable.

are healthy; but if, from an admixture or underlying of clay, they lose this property, they are often damp. The water must be carefully examined. The hard millstone grits are very healthy. *Gravels* of any depth are healthy, except water rises through them. Dr. Parkes considers gravel-hillocks as the healthiest of all sites, and the water as being very pure. *Clay*, *Dense Marls*, and *Alluvial Soils* must be regarded with suspicion. Such soils, and especially the deltas of rivers, should, if possible, be avoided as sites, and if they must be chosen, thorough sub-soil draining, careful purification of the water, and elevation of the houses far above the soil, are the measures to be adopted. According to Dr. Forbes Watson, nearly one-third of the whole surface of India is covered by alluvial soil.

CLIMATE.—The most important climatic conditions connected with the air are *temperature, humidity*, and *movement, weight, and composition of the air*. Under the head of temperature we might enter into the general subject of acclimation; we must, however, confine ourselves to the remark, that Europeans from temperate climates seem to flourish in countries not much hotter than their own, as in some parts of Australia and New Zealand, although it is yet too soon to decide whether the general vigor of the race will improve or diminish. In countries with a yearly mean of 20° F. higher than the home climate, as in many parts of India, the race seems to dwindle, and gives indications of dying out. The endemic diseases of Europeans in the tropics are liver-disease and dysentery, but it is uncertain how far other influences may be at work besides heat in the production of these diseases. Rapid changes of temperature are always dangerous. The sudden check to the free action of the skin caused by a cold wind, is sure to give rise to catarrh, inflammations, and neuralgia. The Registrar-general's returns show that when the temperature in London falls from 45° to 27°, the weekly mortality is increased by 400, bronchitis being the disease which mainly causes this increase—an affection which usually does not prove fatal in more than about 40 cases weekly. The fatal influence of extreme cold in depressing the nervous system, and giving rise to a sleep from which there is no awakening, is noticed in the article COLD. According to their humidity, climates are also divided into *moist* and *dry*. The most agreeable amount of moisture to most persons is when the relative humidity* is between 70 and 80 per cent.

In chronic lung-diseases, a still moister air is most pleasent, and serves to allay cough. The morbid effects of undue moisture are always associated with rise of temperature. As a general rule, warmth and great humidity are less oppressive than cold and great humidity. There seems to be close relation between the spreading and the checking of certain epidemic diseases and the relative moisture of the atmosphere. The malarious diseases are most intense when the moisture is excessive; while plague and small-pox are checked by a very dry atmosphere. Yellow fever seems unaffected by this atmospheric condition. That the humidity of a climate, irrespective of other climatic relations, is not injurious to life, may be inferred from a comparison between the climates of England and Ireland. The number of persons over 100 years of age is, in proportion to the population, five times as great in Ireland as in England, and the greatest longevity has been observed in Connaught, the wettest of the provinces.†

See Mapother, *op. cit.*, p. 134.

The *movement of the air* is another climatic condition of importance, but it must be considered in connection with heat and moisure. A cold wind abstracts the bodily heat in proportion to its velocity; while a hot wind, if dry, increases evaporation, and may thus partly neutralize its own heating power. Variations in atmospheric pressure are of great importance in relation to health. 'In ascending mountains,' says Dr. Parkes, 'there is rarefaction, i. e., lessened pressure of air, lowered temperature, and lessened moisture above 4000 feet; greater movement of the air; increased amount of light; greater sun-radiation, if clouds are absent; and the air is freer from germs of infusoria.'

'Owing to the rarefaction of the air and watery vapor, there is greater diathermancy of the air; the soil is rapidly heated, but radiates also fast, hence very great coolness of the ground and of the air close to it at night.'—*Op. cit.*, p. 418. The physiological effects of lessened pressure begin to be perceptible at somewhat less than 3000 feet, at which altitude the mercury falls 3 inches. The pulse is quickened by 15 or 20 beats, and the breathing by 10 or 15 inspirations per minute; there is increased evaporation from the skin and lungs, while the urinary secretion is probably diminished. At an elevation of 6000 or 7000 feet, as in the Swiss Alps, the effect of the mountain air shows itself in a marked improvement in digestion, sanguification, and in nervous and muscular vigor. At great heights, there is swelling of the superficial vessels, and occasional bleeding of the nose and lungs; and a sensation of weight is felt in the limbs from the lessened pressure on the joints. A residence for some time in a mountain-air is of great value in all anæmic affections, from whatever cause they may arise. Neuralgia, gout, and rheumatism are all benefited by high alpine positions (see Weber *On the Climate of the Swiss Alps*, 1864); and scrofula and consumption are almost absent in the true alpine regions, while patients affected with these diseases, if brought to such a climate, rapidly improve. On the other hand, pneumonia, pleurisy, and acute bronchitis are more common in high regions than lower down. The disease formerly known as 'mountain asthma' seems, from Weber's observations, to be common pulmonary emphysema combined with or followed by chronic bronchitis.

FOOD is a subject which has been already considered in the articles DIET and FOOD AND DRINK. There are, however, certain points connected with it which obviously fall within the domain of hygiene; as, for example, (1) the quantity of the different kinds of food required for persons of different sexes and ages, and under varying conditions of life and climate; (2) the determination of the best articles of food in each class, and whether they are in a proper state for use. The first of these subjects is to a considerable degree discussed in the article DIET. The latest and probably the most accurate statements on this subject are those of Pettenkofer and Voit (quoted in Parkes's *Sanitary Report of the Army for* 1865); a strong average man requires, according to these physiologists, 5·22 oz. of dry nitrogenous matters, 3·63 oz. of fat, and 13·3 oz. of carbohydrates. They also find that when the food is sufficient, the daily excretion of carbon from the lungs is 8·92 oz. or 3902 grains. We may add that an average man, at moderate work, takes, in 24 hours, from $\frac{1}{18}$th to $\frac{1}{20}$th of his own weight in solid and liquid food—viz., from 34 to 46 ounces of so-called solids, as bread, meat, &c.; and from 50 to 80 ounces of water. The ratio of the solid to the liquid food is generally 1 to 2, but may be 1 to 6. Great bodily exercise requires a greater increase of the solid than of the liquid food.

It may be interesting to many readers to know the amount and nature of the daily diet of an English soldier* on home service and the railway navvy:

Soldier.	Oz.	Navvy.	Oz.
Meat	12	Meat	13·7
Bread	24	Bread	28·5
Potatoes	16	Potatoes	7
Other vegetables	8	Other vegetables	0·57
Coffee	0·33	Butter	0·57
Tea	0·16	Cheese	1·7
Salt	0·25	Beer	37
Sugar	1·33	Coffee	0·5
Milk	3·25	Cocoa	1·1

Deputy-inspector-generals O'Flaherty and Taylor, and Assistant-surgeon Spurway, published, in 1867, important articles on the diet of soldiers in the 7th volume of the *Statistical, Sanitary, and Medical Reports for the year* 1865, from which it would appear that, *inter alia*, an addition to the fatty food would be expedient. For information on the *Dietary of Workhouses and Prisons*, we must refer to Dr. E. Smith's admirable report on the former subject, and to Dr. Lankester's paper, 'On Prison and Workhouse Dietaries,' read before the Health Department of the Social Science Congress at Belfast—an abstract of which may be found in the *British Medical Journal* for November 2, 1867. The whole subject of prison dietaries requires revision. While in some favored institutions the prisoners live in comparative luxury, in others the dietary scale is far too scanty. The Irish prisons are especially faulty in this respect; the daily expense of the food per head seldom reaching fourpence, and in some jails being only *twopence!*

At Waterford jail no food is allowed from 3 P.M. to 8 A.M., and in the Irish jails generally a pint of skim milk constitutes the whole animal diet. It is understood that a commission has been issued to report upon this subject. The proper arrangement of diet for the sick is a matter of great difficulty. In hospitals, fixed scales must, as a matter of convenience, be adopted; but almost every special case requires a modification. For further information on special diets, the reader is referred to Moleschott's *Physiologie der Nahrungsmittel;* (1860); to Dr. Dobell's useful *Manual of Diet and Regimen;* and to Dr. Smith's *Practical Dietary for Families, Schools, and the Laboring Classes.*

The diseases connected with food are so various that we can only notice the most important. Passing over those which arise from excess of food generally, or of one of its classes, with the remark, that a prolonged excess of albuminates gives rise to congestion and enlargement of the liver, and a general state of plethora, while excess of starchy matters may possibly affect the

* By *relative humidity* we express comparative moisture, complete saturation being assumed to be 100. It is determined by dividing the weight of vapor actually existing in the air (or the absolute humidity), by the weight of vapor which would have been present if the air had been saturated.

† The average annual relative humidity of Ireland is 85, but on many days it attains as high a point as 94.

* We learn from Froude's *History of England*, that in the reign of Edward VI. the English soldier's rations during war were, meat, 2 lbs.; bread, 1 lb.; light French wine, 1 pint.

muscular fibres of the heart and voluntary muscles, and certainly often renders the urine saccharine, we proceed to notice the diseases produced by the deficiency of food. The history of epidemic fevers in all ages and countries shows the close relation between famine and fever. The *Irish famine* of 1847—1849 is now a matter of history. In those three years, no less than 579,721 cases were treated in the hospitals alone. Fleeing in despair, emigrants carried the germs of disease with them; and the so-called *ship-fever* which followed destroyed its thousands. Its malignity was most appalling. In one vessel, 329 out of 349 passengers caught the fever, and 117 died; and the mortality in Liverpool, induced by the contagion of the fever-stricken Irish who landed there, suddenly became the highest ever recorded in any modern town—the death-rate being raised to 70 per 1000.

During the three years, 1865, 1866, and 1867, the death-rate of this town was 36, 42, and 30. Dr. Mapother is of opinion that the introduction of the potato as an almost sole article of diet has been productive of much harm, in consequence of the deficiency of that root in nitrogenous matters and in salts of lime and magnesia.* To this source he traces indigestion, consumption, scrofula, rickets, ophthalmia, and chronic rheumatism. The deprivation of starchy food, on the other hand, can be borne for a long time if fat be given; but the simultaneous deprivation of fat and starch soon induces illness, though albuminates be supplied.

With regard to salt meat, it must be recollected that the brine, if it has been used several times, occasionally becomes poisonous. The evidence as to the power of diseased meat when eaten to excite disease, is—if we except the cases in which entozoa are present—very unsatisfactory. We have the evidence of Sir Samuel Baker and others that certain African tribes eat without injury meat swarming with maggots. In this country, the flesh of healthy animals, when decomposing, is sometimes eaten with impunity, and sometimes occasions severe gastric intestinal disorders. There is reason, however, to believe that if slightly tainted meat, poultry, or river fish be washed in a very dilute solution of Condy's fluid, previous to being cooked, all danger is removed. The occasional occurrence of a poison in sausages and even in pork pies is well known, although its nature is not clearly understood. The fresh flesh of diseased animals assuredly causes injurious effects in many cases, but not in all. In the early stage of acute inflammatory disease, the meat is not altered, and may be eaten with impunity. Whether the epidemic pleuro-pneumonia of cattle renders their flesh unfit for use, is an open question. (See Mapother, *op. cit.*, pp. 217—224, who decidedly condemns its use, and Parkes, *op. cit*, pp. 161—166, who quotes conflicting evidence.) The discrepancy of evidence is equally great regarding anthrax and malignant pustule. The death of sheep from splenic apoplexy or braxy, and from small-pox, renders their flesh unfit for food; while the flesh of cattle destroyed by foot-and-mouth disease and by typhoid fever has been largely used in France without injury. The detection of the adulterations of the ordinary articles of food is a very important duty in relation to hygiene; on this subject, we must refer to Hassall's great work, and to our article FOOD.

The object of CLOTHING is to preserve the proper heat of the body by protecting it both from cold and heat, and thus to prevent the injurious action of sudden changes of temperature upon the skin. The most important materials of clothing are cotton, linen, wool, silk, leather, and india-rubber. *Cotton*, as a material of dress, wears well, does not readily absorb water, and conducts heat much less rapidly than linen, but much more rapidly than wool. From the hardness of its fibres, its surface is slightly rough, and occasionally irritates a very delicate skin. Its main advantages are cheapness and durability. In merino it is mixed with wool in various proportions, and this admixture is far preferable to unmixed cotton. *Linen* is finer in its fibres than cotton, and hence is smoother. It possesses high conducting and bad radiating powers, so that it feels cold to the skin; moreover, it attracts moisture much more than cotton. For these reasons, cottons and thin woollens are much preferred to linen garments in warm climates. *Silk* forms an excellent underclothing, but from its expense, it can never come into general use. *Wool* is superior both to cotton and linen in being a bad conductor of heat, and a great absorber of water, which penetrates into the fibres and distends them (hydroscopic water), and also lies between them (water of interposition). 'This property of hydroscopically absorbing water is,' as Dr. Parkes observes, 'a most important one. During perspiration, the evaporation from the surface of the body is necessary to reduce the heat which is generated by exercise. When the exercise is finished, the evaporation still goes on, and to such an extent as to chill the frame.

'When dry woollen clothing is put on after exertion, the vapor from the surface of the body is condensed on the wool, and gives out again the large amount of heat which had become latent when the water was vaporized. Therefore, a woollen covering, from this cause alone, at once feels warm when used during sweating. In the case of cotton and linen, the perspiration passes through them, and evaporates from the external surface without condensation; the loss of heat then continues. These facts make it plain why dry woollen clothes are so useful *after* exertion. In addition to this, the texture of wool is warmer, from its bad conducting power, and it is less easily penetrated by cold winds.' *Op. cit.*, p. 353. *Leather* is used not only for shoes, boots, and leggings, but in cold windy countries, for coats. Leather and sheep-skin coats are in common use in Turkey, Tartary, Persia, the Danubian Provinces, and in Canada, where buffalo-skins are often used. For persons specially susceptible to cold, and of delicate organization, a chamois leather jacket worn over a flannel waistcoat may be recommended with advantage during the winter months. *India-rubber* clothing must be used with extreme caution. From its being impenetratable to wind, and from its condensing and retaining the perspiration, it is decidedly objectionable; while, on the other hand, its protection against rain is a very valuable property. The Council of Health of the French army have refused to admit waterproof garments amongst their soldiers; and in this country it has been prohibited amongst the London postmen.

In relation to protection against heat, we have to consider the color and not the texture of clothing. White is the best color, then gray, yellow, pink, blue and black. Hence, in hot countries white or light gray clothing should be preferred.

The shape and weight of all articles of clothing should be such as to allow of the freest action of the limbs, and in no way to interfere by pressure with the processes of respiration, circulation, or digestion. In a complete treatise on hygiene, a discussion on the relative advantages and disadvantages of the various articles of clothing used by both sexes would find a proper place, but our limited space totally precludes us from entering into this subject.

ATTENTION to the STATE OF THE SKIN is of great importance in a hygienic point of view, the perspiration and sebaceous matters which are naturally poured out upon the surface of the body, with an intermingling of particles of detached epidermis, fragments of fibres from the dress, dirt, &c., if not removed, gradually form a crust which soon materially interferes with the due excreting action of the skin. There is little doubt that the daily use of the matutinal *tub*, which less than half a century ago was unheard of, and is now a matter of necessity with most healthy persons who have the means of using it, has contributed materially to harden the system against attacks of colds, rheumatism, &c. When a tub and sponge happened to be unattainable, a wet towel rubbed over the body, followed of course by a dry one, is a good substitute.

EXERCISE is the subject that next claims our consideration, and we shall briefly notice its effects on the different systems of organs. (1) The most important effect of muscular exercise is produced on the *lungs*, the quantities of inspired air and of exhaled carbonic acid being very much increased. Taking the air inspired in a given time in the horizontal position as unity, a man walking 3 miles per hour inspires 3·22; and if carrying 34 lbs., 3·5; a man walking 4 miles per hour inspires 5; and when walking 6 miles per hour, no less than 7. Almost twice as much carbonic acid is exhaled during exercise as during rest. Hence, muscular exercise is necessary for the due removal of the carbon; and it is obvious that in a state of prolonged rest, the carbonaceous food must be diminished, or the carbon will be liable to accumulate in the system; and further, it is clear that for strong exercise, carbonaceous food should be freely given. (2) The action of the *heart* rapidly increases in force and frequency during exercise. The increase in the number of beats may range from 20 to 30, and is sometimes much more. After exercise the heart's action is diminished. Excessive exertion may do harm by inducing pulmonary congestion, and even hæmoptysis, palpitation, hypertrophy, valvular disease, and occasionally rupture; while deficient exercise probably tends to induce tuberculous disease of the lung, weakness of the heart's action, and probably dilatation and fatty degeneration. From these facts we learn, that when a person commences any new form of exercise or gymnastics, the heart's action should be watched, and if the pulse rise to 120 or more, the exercise should for the time cease.

(3) The *skin* becomes red from increase of blood in the capillaries, and the perspiration is increased, being at least doubled. The bodily heat is kept down by cutaneous evaporation, which reduces the temperature. During exertion, there is very little danger of chill, but the danger becomes great when the exertion is

* Potatoes contain 74 per cent. of water, 1·5 of albuminates, 0·1 of fat, 23·4 of starch, cellulose, &c. (the carbo-hydrates), and 1 of salts. The chief ingredients of the salts are potash, about 50 per cent.; and phosphoric acid, about 13 per cent. The juice of the potato abounds in salts of organic acids (citric, tartaric, &c.), which on incineration are converted into carbonates—the carbonic acid thus formed amounting to 13·3 per cent. The relative proportion of fat to albuminates in the food which is most easily digested, and at the same time produces the greatest mechanical force, is as 1 to 2; in the potato, it is as 0·1 to 1·5, or as 1 to 15. Again, the starchy matters should be to the nitrogenous as 3 to 1 in the best diet: in the potato, they are as 23·4 to 1·5, or as 14 to 1 nearly. On this subject see the article MUSCULAR FORCE, ORIGIN OF.

over, because there is then a rapid fall in the heat of the body, while the evaporation of the skin continues. Hence, while the skin may be freely exposed during exercise, it must be covered immediately afterwards, in order to prevent any feeling of coolness on the surface. (4) The *muscles* grow to a certain limit, but over-exercise of any special group may produce wasting. Care must be taken that the exercise is of such a nature that all the muscles, and not single groups, should be brought into play; and that in early training, long intervals of rest should intervene between the periods of exercise. (5) The effect of exercise on the *mind* is not clearly determined; great bodily activity is often observed in association with full mental activity; but there is a fear that, in our great public schools and universities, boating and cricket are supplanting more useful subjects, and leaving too little time for the due performance of intellectual work. (6) *Digestion* is improved by exercise. The appetite increases, and nitrogenous substances, fats, and salts, especially phosphates and chlorides, are required in greater quantity than in a state of rest. (7) The *change of tissues* is increased by exercise, or, in other words, the excretions give off increased quantities of carbon, nitrogen, water, and salts. The muscles require much rest for their reparation after exercise, and they then absorb and retain water, which seems to enter into their composition. So completely is the water retained in the muscles, that the urine is not increased for some hours. Hence, observes Dr. Parkes, there is an absolute necessity of water for the acting muscles, and the old rule, held by trainers, of only allowing the smallest possible quantity of fluid, must be wrong.

The amount of exercise which should be taken by an adult healthy man is a subject of great importance. Professor Haughton, in his *New Theory of Muscular Action*, calculates that a laboring man daily exerts a muscular force to a degree which may be expressed by saying, that he would raise to the height of 1 foot from 250 to 350 tons. For persons not obliged to labor, the force expended, including that required for the ordinary avocations of life, should average 150 tons, which is equivalent to walking about 9 miles daily. It is unfortunately impossible to arrange scales of exercise for invalids, women, and children. Professor Haughton has shown that walking on a level surface is equivalent to raising the $\frac{1}{20}$th part of the weight of the body through the distance walked. When ascending a height, a man of course raises his whole weight through the height ascended. Using his formula, $\frac{W + W'D}{20 \times 2240}$ (where W is the weight of the person, W′ the weight carried, D the distance walked, 20 the coefficient of traction (see FRICTION), and 2240 the number of pounds in a ton), we obtain as a result the number of tons raised 1 foot; and on applying it, we get the following table :

Kind of Exercise.	Weight done in Tons lifted one foot.
Walking 1 mile	17·67
" 20 miles	353·4
" 1 mile, and carrying 60 lbs.	24·75
" 20 miles, " "	495

Thus, a march of 10 miles, with a weight of 60 lbs. (which is about the weight a soldier carries when in marching-order, but without blankets and rations), is a moderate day's work. A 20 miles' march with this weight is a very hard day's work. As a continuous effort, Professor Haughton believes that walking 20 miles a day without a load (Sundays excepted) is good work.—For a discussion on the various forms of exercise, as horse-exercise, boating, dancing, and gymnastics, we may refer the reader to Mapother, *op. cit.*, pp. 263—268. In connection with the subject of exercise, the reader is referred to the article MUSCULAR FORCE, ORIGIN OF.

The CONSTRUCTION OF HOUSES, especially of dwelling-places for the poor, and public lodging-houses, next claims our notice. There can be no doubt that the frequency and fatality of the epidemics of the middle ages were in a great measure due to unhealthy habitations. The houses were usually closely packed in crowded streets, and were often built for the purpose of defence, at a sacrifice of ventilation, lighting, draining, &c. At the present day, with all our boasted civilization, the dwellings of the poor, both in our large towns and in our country villages, are too often a disgrace to humanity. Any one may readily satisfy himself on this point by reading the various government reports referred to in an early part of this article, the Annual Reports of the Medical Officer of the Privy Council, and the Reports which are annually published by many of our Officers of Health.

An article on the Sanitary State of Manchester, which appeared in the *Quarterly Journal of Science* for April 1867, reveals a condition of the dwellings of the poor which seems almost incredible to those who have not previously studied this important but uninviting subject. In many parts of Ireland, as we learn from Dr. Mapother, the dwelling-places of even the small farmers are hardly fit for a healthy existence. Dr. Tucker of Sligo draws the following picture of 'the homely hovel of a small farmer, which may be taken as the prototype of many. It was about 12 feet wide and 24 feet long. The domestic circle that dwelt therein consisted of a sick man, his wife, four daughters, one son, three cows, one horse, two calves, two pigs, and poultry—all in one common undivided house, without a partition. Generally, the pigs dwelt beneath the beds, the people in them, and the poultry overhead.' On the evils, physical and moral, arising out of such a system it is unnecessary to dwell.

Much has of late years been done in London (by the benevolence of Baroness Coutts, Mr. Peabody, Alderman Waterlow, and others) and in many other large towns to improve the dwellings of the poor, and to give them, on moderate terms, a far more healthy and commodious house-accommodation than they could otherwise obtain. Many of these improved dwellings seem fever-proof, and the death-rate has been found much lower than in adjacent places. Even without the aid of private benevolence, the erection of blocks of improved dwellings for the working-classes has proved remunerative. Five conditions are requisite in order to insure healthy habitations, on whatever scale they may be constructed : (1) A site dry and not malarious, and an aspect which gives light and cheerfulness; (2) a ventilation sufficient to carry off all respiratory contaminations of the air; (3) a system of immediate and perfect sewage removal; (4) a due supply and proper removal of water; and (5) a construction of the house such that perfect dryness of its foundation, walls, and roof is insured. For further information on this important topic, the reader is referred, *inter alia*, to the various works of Mr. Godwin, especially his *Another Blow for Life;* to Mr. Hole's interesting book entitled *The Homes of the Working-classes;* and to Dr. Mapother's *Lectures on Public Health* (2d ed. pp. 297—326).

SEWAGE is sufficiently considered in the special article devoted to that subject (see also SEWAGE EARTH-CLOSET); and we pass on to another subject closely connected with hygiene—viz., the DISPOSAL OF THE DEAD. To see the importance of this subject, the reader must know something of the changes which the body undergoes after death. A body that has been buried gradually breaks up into a large number of comparatively simple compounds, such as carbonic acid, ammonia, sulphuretted and carburetted hydrogen, nitrous and nitric acid, and certain more complicated gaseous matters with a very fetid odor, which finally undergo oxidation; while the non-volatile substances usually enter into the soil, and either pass into plants, or are carried away by the water percolating the soil. These changes are accelerated by the worms and other low forms of life that usually swarm in decomposing bodies; and the character of the soil materially influences the degree of rapidity of destruction. The bones remain almost unchanged for ages. If a body is burned, decomposition is incomparably more rapid, and different volatile combinations may arise; the mineral salts and a little carbon alone remaining. The question for our consideration is, What is the best method of disposing of our dead, so that the living may suffer the least? Putting aside the visionary schemes for turning the dead to commercial account, there are three methods for consideration—viz., burial in land or in water, or incremation.

At present, as Dr. Parkes observes, the question is not an urgent one; but it may become so in a century or two, if the population goes on increasing at the present rate. Even in our own time, a great change has taken place, and the objectionable habit of interments in and round churches in towns has been given up, cemeteries in the country being now commonly employed, except in the case of country villages. The air over cemeteries is, however, always contaminated, and water percolating through them is unfit for drinking purposes; and there is a general and very decided opinion that the vicinity of graveyards is unhealthy. The evils are lessened by making the grave as deep as possible, and by placing not more than one body in one grave. Plants should be freely introduced into every cemetery, for the absorption of organic matters and of carbonic acid; and the most rapidly-growing trees and shrubs should be selected, in preference to the slowly-growing cypress and yew. We may add that the superficial space which should be allotted to each grave varies in different countries from 30 to 90 feet, and that the depth should be at least 6 feet. It is required by law that the grave spaces for persons above 12 years of age shall be at least 9 feet by 4, and those for children under 12 years 6 feet by 3. It is likewise required that not less than 4 feet of earth should be placed over the coffin of an adult, and 3 feet above that of a child. The time which should elapse before a grave is disturbed for a new tenant varies with the soil and the distance of the body from the surface. Under favorable circumstances, a coffin containing an adult will disappear with its contents in about 10 years; while in a clayey or peaty soil, it will remain a century.

It is generally assumed that a period of 14 years is sufficient for the decay of an adult, but long before this time, all will have disappeared but the skeleton. If the question should in course of time arise between burying in the sea and burning, it will be de-

cided, Dr. Parkes believes, in favor of the former, on the following grounds: 'It is true that the impurities in burning can be well diffused into the atmosphere at large, and would not add to it any perceptible impurity. But if the burning is not complete, fetid organic matters are given off, which hang cloud-like in the air, and may be perceptible and even hurtful. As a matter of expense, too, the system of incremation would be greater than the burial at sea. In the burial at sea, the body would go at once to support other forms of life more rapidly than in the case of land-burial and without the danger of evolution of hurtful products.' On this subject, the reader may further consult the Report drawn up by Mr. Chadwick on the State of Cemetaries; the Report of the General Board of Health, 1858 (of which Mr. Chadwick and Dr. Southwood Smith were members), on the same subject; Dr. Mapother's 14th Lecture 'On the Burial of the Dead;' and a work published by M. Favrot, entitled *Histoire des Inhumations*, 1867.

The Reports to which we have just referred contain abundant evidence of the necessity for the universal establishment of mortuaries, or houses for the reception of the dead until the period of the burial. In some parts of Germany, the deposit of the dead in such houses is compulsory; and in many parts of the continent, there are laws rigidly enforcing the burial within a certain number of hours after death.

Before proceeding to consider how far our sanitary regulations have effected a saving of human life, it is expedient to give a brief notice of the chief acts of parliament which have passed, and government Reports that have been officially published, bearing on important sanitary subjects. Beginning with 1833, in which the Factory Children's Act was passed; in 1834, the practice of employing climbing boys for sweeping chimneys was abolished; in 1840 and 1841, the Act to Extend the Practice of Vaccination was passed; and in 1842, the employment of women and children in mines and collieries was abolished. Then appeared the General Local Reports on the Sanitary Condition of the Laboring Classes, 1842, which constitute, as Dr. A. P. Stewart well observes, a 'remarkable series of volumes, for which we were indebted chiefly to Mr. Chadwick, and which, revealing as they did an almost incredible state of matters in our crowded centers of population, were read by multitudes with a strange and eager interest.' —*The Medical and Legal Aspects of Sanitary Reform* (1867), p. 5. These Reports of the Health of Towns Commission led to the passing in rapid succession, of 'the Acts for Promoting the Establishment of Baths and Wash-houses in Great Britain and Ireland, in 1846; the Towns Improvement Act in 1847; the Public Health, the Nuisances Removal, and the City of London Sewers Acts, in 1848; the Metropolitan Interments Act, in 1850, followed in 1853 by a similar act for the whole of England; the Act to Encourage the Establishment of Lodging-houses for the Laboring-classes, and the Common Lodging-houses Act, in 1851; the Metropolitan Water Act, in 1852; the Smoke Nuisance Abatement (Metropolis) Act, and the Act to Extend and Make Compulsory the Practice of Vaccination, in 1853; the Merchant Shipping Act, with its stringent provisions for the preservation of the health of our merchant seamen, in 1854; the Diseases Prevention, the Metropolis Local Management, the Metropolitan Buildings, and the Nuisances Removal Amendment Acts in 1855; and the Public Health Act of 1858, which abolished the General Board of Health, and vested its powers in the Privy Council.

Since then, there have been added to the statute-book the Acts for the Purification of the Thames, in 1858 and 1866; the Act for Preventing the Adulteration of Articles of Food and Drink, in the same year; the Acts (passed in 1860, 1861, and 1864) which included, under the provisions of the Factory Acts, women and children employed in bleaching and dyeing works, in lace factories, and in the manufacture of earthenware, of lucifer-matches, of percussion caps and cartridges, of paper-staining and of fustian-cutting; the Vaccination Amendment Act in 1861; the Act for the Seizure of Diseased and Unwholesome Meat, and the Alkali Works Act, in 1863; the Sewage Utilization Act, in 1865; the Laboring-classes' Dwelling-houses Act, and the Sanitary Act, in 1866.'—Stewart, *op. cit.*, p. 6. The last-named of these acts—the Sanitary or Public Health Act of 1866—contains certain clauses with which every one should be acquainted. Its first part is an amendment of the Sewage Utilization Act, 1865, and provides, *inter alia*, that any owner or occupier of premises within the district of a sewer authority shall be entitled, under certain conditions, to cause his drains to empty into the sewer; but if a dwelling-house is without efficient drainage, the sewer authorities may require the owner to make a sufficient drain, emptying into a sewer, provided the latter be not more than 100 feet distant; and that the sewer authority may provide a supply of water for the use of the inhabitants of the district. The second part is an amendment of the Nuisances Removal Acts—the word 'nuisance' being made to include (1) any house or part of house so overcrowded as to be dangerous or prejudicial to the health of its inmates; (2) any factory or workshop not kept clean and properly ventilated; (3) any fireplace or furnace not, as far as possible, consuming its own smoke; and any chimney (not belonging to a private house) sending forth black smoke.

The rules for the removal of such nuisances are laid down. The nuisance authority, moreover, has power to enforce the cleansing and disinfecting of houses or articles therein likely to retain infection, and to fine those who disregard the injunction; to provide a proper place for disinfecting clothing, bedding, &c., and to effect the disinfection of such articles; to provide carriages for the conveyance of infected persons to hospitals, &c. The 25th clause is so important, and its nature so very little known, that we extract it *verbatim*: 'If any person suffering from any dangerous infectious disorder, shall enter any public conveyance without notifying to the owner or driver thereof that he is so suffering, he shall, on conviction thereof before any justice, be liable to a penalty not exceeding £5, and shall also be ordered by such justice to pay to such owner or driver all the losses and expenses they may suffer in carrying into effect the provisions of the act; and no owner or driver of any public conveyance shall be required to convey any person so suffering until they shall have been first paid a sum sufficient to cover all such losses and expenses.' The act further lays it down that places for the reception of the dead may be provided at the public expense, and that any justice may, on the certificate of a legally qualified medical practitioner, order the removal thither of the bodies of those who die of infectious disease;* and gives permission that special places for the performance of *post-mortem* examination may be provided.

The third part of the act is headed 'Miscellaneous.' It treats of various points for the better management of lodging-houses, lays a penalty not exceeding £5 on any person with infectious disorder exposing himself, or on any person in charge of such a sufferer causing such exposure; and a penalty not exceeding £20 on persons letting houses, rooms, or part of a house in which infected persons have been lodging, without having such houses, or rooms, and articles therein, disinfected to the satisfaction of a qualified medical practitioner (the keeper of an inn is deemed to let part of a house to any person admitted as a guest into such inn). It is very much to be regretted that most of the provisions of this and other acts bearing on public health are permissive, and not peremptory.

We may note that since 1858 a Public Health Department has been established in the Privy Council, and that the Medical Officer of the Privy Council, Mr. Simon, has, since that date, published an annual Report of the Proceedings taken under the Public Health Act, 1858. These Reports are not merely of great interest, but of the highest practical importance; and we should not omit to mention that the progress of sanitary science has been considerably advanced by the publication of an annual volume, containing a valuable series of statistical, sanitary, and medical army reports by the establishment of the Epidemiological Society and the Social Science Congress, and by the publication of their Transactions.

It is much to be regretted that the Privy Council does not more energetically carry out the powers conferred on them by the Diseases Prevention Act, 1855, and the Public Health Act, 1858. Unfortunately, however, it requires some comparatively rare and startling disease, as yellow fever, plague, cholera, or cattle-disease, to stir that august body into activity; while typhus, typhoid, and small-pox may ravage our crowded towns and undrained villages, and carry off their thousands of victims, unless in very extreme cases, to which the public press may have called attention. (Of the half million deaths that occur annually in England, more than 20,000 are due to typhus and typhoid;† while in England and Scotland, more than 5000 persons annually fall victims to small-pox.‡) By the Sanitary Act, 1866, the Home Secretary is empowered to interfere, if he see fit, on complaint made to him of the default of any local authority. It is sincerely to be hoped that he will unsparingly put forth the power intrusted to him.

Passing from what has, and what has *not*, been done by government, let us consider what are the duties of local authorities, and how they discharge them. On this subject, Dr. Stewart gives us much information in his pamphlet already referred to. To such an extent has non-interference prevailed that, except in London, the appointment of Medical Officers of Health, and even of inspectors of nuisances, is optional. He ascertained, that of 570 places under the Local Government Act, 1858, and the Public Health Act, 1848, with populations varying from 214 to 200,000, 50 have no inspectors of nuisances, 153 have each one; while in 347, one man holds the double or treble offices of surveyor, inspector, and collector. In the metropolitan districts, with a population of above 3,000,000, the sanitary force is most unequally

* Liverpool alone, so far as we know, has as yet taken advantage of this clause. The Council have erected three mortuaries; and a mortuary chapel for the Roman Catholics has been built partly at the expense of Mr. Hutcheson, a Protestant gentleman, and partly by subscription. (Stewart, *op. cit.*, p. 74.)

† According to Dr. W. Budd, typhoid alone is the cause of from 15,000 to 20,000 deaths in England.

‡ For data on this subject, see the foot-note to p. 813.

divided, for, while 2 subdistricts, with a population of 4000 and 10,000 respectively, have the services of one inspector, St. Marylebone and St. Pancras, with respective populations of 163,000 and 211,000, have each of them only two.

A few words on the duties, qualifications, and position of the Medical Officer of Health, will find a fitting place here.* His duties and qualifications are thus laid down in an Instructional Minute of the General Board of Health, dated December 20, 1855:

'He will make himself familiar with the general features of the place, with its previous sanitary state, and with its existing provisions for health—viz., the levels, inclinations, soil, wells, and water-springs; with its meteorological peculiarities; with its burial-grounds, slaughter-houses, lodging-houses, &c.; he will see to the general healthiness of his district, inquire into the cleanly and waterproof condition of houses, examine the drinking-water, and observe whether diseased meat or adulterated articles of food are exposed for sale; and will report weekly and annually to the Local Board.' These are but a few of his duties, for the proper performance of which (as the Minute goes on to add), special qualifications in science are required. 'These lie in pathology, including vital statistics, in chemistry, and in natural philosophy.'

For these accomplishments, the town of Aberdare offers 8½*d.* a day, or 12 guineas a year, for looking after the health of its 35,000 inhabitants; while Paisley gives £20 for the sanitary superintendence of a population of 48,000.

Fifty pounds is a common salary, except in the metropolis; the most liberal salaries are £350 at Birkenhead and Hackney, £400 at St. Marylebone, £500 at Edinburgh and Leeds, £600 London (Proper), while Liverpool has nobly raised the salary to £1000. Surely £500, £600, and £1000 are not too much for Edinburgh, London, and Liverpool to pay, in order to secure the services of such men as Littlejohn, Letheby, and Trench. Dr. Russell, the medical sanitary officer for Glasgow, has £600 a year; and Dr. Gairdner, one of the first of our living hygeists, is retained as consulting officer at £100 a year. Not only is the medical officer's salary dependent on the caprices of the local board, who may dismiss him at pleasure, but, as Dr. Stewart truly observes, 'the very efficiency with which he performs his duties may be an unpardonable sin in the eyes of a majority of his masters. His statements of facts may touch the interests of some, his suggestions of remedies may excite the displeasure of others; and if the soundness of his position cannot be assailed by reasoning, passion may suggest—as it has before now suggested—a reduction of salary or a threat of dismissal, as likely to bring the offender to his senses.' Not only is this disgraceful form of pressure brought to bear *directly* on the Medical Officer of Health, but *indirectly* on those who have the power of electing or dismissing him. An amusing incident of this nature is mentioned in Dr. Stewart's pamphlet. When Dr. Robinson was appointed Officer of Health for Leeds, he found that he had to grapple with unparalleled privy abominations, piggeries by hundreds, numerous slaughter-houses, the gigantic smoke-nuisance, and an average death-rate of 30 in 1000. The battle between science and filth was prolonged and terrific, and the piggeries were made the battle-field.

The pig-owners, taking alarm at Dr. Robinson's energy, formed themselves into a 'Pig Protection Society,' summoned ward-meetings, and commenced an active canvas, for the purpose of turning out of the council all who would not pledge themselves to vote for Dr. Robinson's dismissal. The case, after being twice heard before the magistrates, who declared that the pigs were a nuisance, and must be removed, was finally settled on appeal by the recorder, who gave an order, not for the eviction of the pigs, but for the daily removal of the manure, for the due enforcement of which a separate inspector would be required for every pig-sty! Under these conditions, is a Medical Officer of Health fairly encouraged to discharge his proper duties?

The next points to which we shall direct attention are the NUMBER OF DEATHS occurring annually in England and Wales, and the CAUSES OF THESE DEATHS; and we shall then proceed to inquire how far the deaths from some of our most fatal diseases might have been prevented by due attention to sanitary measures.

We learn from the Twenty-eighth Annual Report of the Registrar-general of Births, Deaths, and Marriages in England, which was published in 1867, and gives the results for the year 1865, the following statistical facts, which bear more or less closely on our subject. The population of England, the births, deaths, and excess of births over deaths, are tabulated from the year 1838, when the system of registration came in force; and from this table we extract the numbers for 1838, 1848, 1858, and for 1861—1865 inclusive:

Years ending Dec. 31.	Estimated Population in middle of year.	Births (exclusive of still-born).	Deaths.	Excess of Births.
1838	15,312,256	463,787	342,760	121,027
1848.....	17,340,492	563,059	399,833	163,226
1858.....	19,471,291	655,481	449,656	205,825
1861.....	20,119,314	696,406	435,114	261,292
1862.....	20,336,417	712,684	436,566	276,118
1863.....	20,554,137	727,417	473,837	253,580
1864.....	20,772,308	740,275	495,531	244,744
1865.....	20,990,946	748,069	490,909	257,160

From these figures, we learn, *inter alia*, that in a quarter of a century the population has added 5,000,000 to its strength, and that there is a steady increase (with occasional exceptions) in the annual number of births and deaths, and in the excess of the former; the number of births having increased during that period 46 per cent., and that of deaths 43 per cent. The following is an abstract of Dr. Farr's letter to the Registrar-general on the causes of death in England in 1865: In every 1000 deaths, 381 of the population fell before local diseases, 235 were struck down by zymotic diseases, 182 by constitutional diseases, 160 by developmental diseases, and 36 died violent deaths; the remaining 6 were deaths from causes not ascertained. *Local diseases*—the inflammations and functional diseases of organs—carried off 184,877 persons in England, causing 9 of the 23 deaths per 1000 of the living. It is the deaths from diseases of the vital organs that swell this number so high—22,272 deaths from heart diseases, nearly as many (21,774) from diseases of the digestive organs, more than thrice as many (69,952) from diseases of the respiratory organs so essential to life, and a number nearly as large as this last (60,264) from diseases of the nervous system.

The number of deaths in England ascribed to bronchitis has rapidly increased; it was but 21,528 in 1856, had advanced to 32,346 in 1860, and in 1865 reached 36,428. Softening of the brain is another disease that has increased rapidly of late years, and in 1865 was fatal to 1051 males and 627 females: these deaths would formerly have been classed under paralysis and other heads. The deaths from diseases of the nervous system include 26,722 from convulsions, occurring chiefly in children. Among the rarer deaths from local diseases, 5 are referred to fright, 3 to grief, and 43 to melancholy. The second most fatal class of diseases—the *zymotic* (epidemic and contagious)—is swelled chiefly by fevers and by diarrhœal disease. It swept from life in England 113,948 persons in 1865, the majority of them young children under 5 years of age. The deaths by cholera in England in 1865 were 1291; by diarrhœa, 23,531. The deaths by fever—typhus, typhia, and typhinia*—which were 13,012 in the year 1860, rose to 23,034 in 1865, and five-tenths of them were registered among four-tenths of the population. The deaths from scarlatina were 17,700, and from diphtheria, 4145. The deaths attributed to syphilis rose to 1647; 437 persons died from intemperance, and 612 from *delirium tremens;* 74 from privation; 19 from hydrophobia; 4 from glanders, for horses as well as dogs, communicate some of their diseases to men.

Worms are put down as the cause of death in 153 cases, one of which is ascribed to *Trichina spiralis*. The third class of deaths is from *constitutional diseases*, diathetic or tubercular, which were fatal to 88,504 persons in 1865. These diseases have this in common with the zymotic, that they are diffusive; and human tubercle is, even when introduced by inoculation, capable of inducing tubercular deposits in the organs of animals. The prevalence of phthisis in the armies of Europe is considered to be probably due in part to the inhalation of expectorated tubercular matter, dried, broken up into dust, and floating in the air of close barracks. Dr. Farr remarks that to test this may be difficult, but the origin and propagation of the most fatal of all human diseases deserves full investigation. The inquiry should also extend to cancer and the other constitutional diseases, among which should perhaps be included diabetes. Among the deaths from constitutional diseases may be noted gout, as increasing every year. Gout is five times as common in men as in women, and is very rarely fatal under 35 years of age. To it, 361 deaths were attrib-

* On this subject Dr. Letheby has published an excellent Memoir, which will be found in the *Medical Press and Circular* for August 7 and 14, 1867; and Dr. Rumsey's address *On State Medicine in Great Britain and Ireland* (Lond. 1867), may also be consulted with advantage.

*In the National Returns, all cases of fever are set down as Typhus, which is thus made to include pure *Typhus* with blood-spots (*petechiæ*) on the skin, which is exceedingly fatal (more than 20 per cent. of the cases in the London Fever Hospital proving fatal), is generated in crowded populations, and is very infectious; *Typhia* or *Typhoid Fever*, which is endemic, is characterized by an eruption of rose-red spots on the skin, and by ulceration of Peyer's glands, and is usually generated by the intestinal evacuations of typhoid patients, which should therefore always be submitted to the action of disinfectant agents (its mortality in the London Fever Hospital is rather less than 20 per cent.); and, lastly, *Typhinia*, which is commonly known as *relapsing* or *famine fever* (it is epidemic and infectious in times of scarcity and famine, and is comparatively harmless, the deaths amounting to only 2½ per cent.). For the introduction of the terms *Typhia* and *Typhinia*, we are indebted to Mr. Farr (see his 24th Annual Report of Births, Deaths, and Marriages in England, 1863, p. 214).

ated in 1865. Unlike gout, dropsy is most fatal to women; and the substitution of dropsy in women for gout in men after the age of 45 is worthy the attention of pathologists. Cancer is more than twice as fatal to women as it is to men. The mortality by all constitutional diseases is rather less than it was in the decade 1850—1859; and this is partly due to the decrease of the number of deaths referred to phthisis; still these deaths reached 53,734 in 1865, the greater part of them occurring in adults; and more than half the deaths of young women between 20 and 25 were caused by phthisis.

The fourth class of diseases—the *developmental*—were fatal to 77,806 persons in England in 1865: 8791 infants born alive died from being premature; and other 22,436 died of debility before they were a year old. Besides 1333 deaths by puerperal fever, and 2490 ascribed to childbirth, 490 women died of specific diseases complicated by parturition. The deaths by ordinary diseases of the 560,000 *enceinte* women, constantly existing in the population of England, could not be entirely distinguished from the deaths of other women of the same age; of course they were subject to the same diseases as others, but probably the class of mothers belongs to what, in a certain sense, the insurance offices call select lives. The list of developmental diseases closes with the deaths of 28,709 persons from old age, 154 of the men and 402 of the women being of the age of 95 and upwards. Thus we reach the last class of deaths—the 17,374 persons who were destroyed by *violent deaths;* 15,232 by accident or negligence, 443 under circumstances bringing the case under the legal denomination of homicide, 1392 by suicide, 6 on the scaffold, and the remaining 301 not classed. These are the several ways in which 490,909 persons died in England in 1865.

Now let us see how many of the above diseases are more or less preventable, and how far we have already been successful in diminishing them. There are parts of England in which, for each 1000 persons living, there die annually only 15;* while there are other parts that, of each 1000 persons, 30 or more† die annually. The 15 and the 30 are said to be the respective death-rates of these places. The average London death-rate is 25; and the most common death-rate in country districts and small towns through all England and Wales is 20. The Registrar-general's Return, published in January 1868, showing the annual rate of mortality in the large towns of the United Kingdom for the year 1867, enables a comparison to be made of the death-rates in the last three years—1865 being the first year of the publication of these results. Thus, the average annual rate of mortality per 1000 persons living in the great cities in each of the years 1865, 1866, and 1867 respectively, was as follows: Birmingham, which is on one of the healthiest sites in the kingdom, 25, 24, and 24; the density of population (persons to an acre) in 1867, was 44. Hull, 27, 24, and 25; density, 30. Bristol, 24, 25, and 23; density, 35. Edinburgh, 28, 27, and 27; density, 40. Dublin, 26, 28, and 27; density, 33. Salford, 29, 29, and 29; density, 22. Glasgow, 33, 30, and 29; density, 87. Manchester, 33, 32, and 31; density, 81. Leeds, 31, 33, and 27; density, 11. Liverpool, 36, 42, and 30; density, 96. The annual mortality in Sheffield, in each of the years 1866 and 1867, was 28 and 25; density, 10. In Newcastle-on-Tyne the annual mortality, in 1866 and 1867 respectively, was 32 and 31. The results for London, in each of the three years 1865—1867 respectively, were, annual mortality per 1000 of population, 25, 26, and 23; density, 40. In comparing the rate of mortality in one town with that of another, it should be borne in mind that of the English towns, Bristol, Leeds, and Liverpool have each a medical health officer. Birmingham, Hull, Salford, Manchester, Sheffield, Newcastle-on-Tyne have no medical health officer, but most of these towns, however, have benefited from the efficacy of hygienic measures.

It is obvious that if, by sanitary precautions, we could reduce all the death-rates to 15, or even to 20, an enormous saving of human life would result.‡ In the year 1865, Mr. Simon suggested that the time was come for attempting to ascertain the amount of benefit to the public health that had been derived from the works of sanitary improvement—especially of drainage and water-supply—that had been already completed, and he was authorized to institute the inquiry, with the assistance of Dr. Buchanan, as an inspector. The result of the inquiry, which relates to 24 towns,§ with an aggregate population of more than 600,000 persons, is now published, and we shall give a brief abstract of the results which have been obtained. The numerical results are given in the accompany table (page 824), where A shows at each place in the list what difference there has been, since sanitary works were established, in the *general death-rate* in 10,000 of the population, this number being taken instead of 1000 to obtain more accurate numerical results. B gives the general death-rates of A, *minus* the inconstant influence which has been exerted by the chief infantile epidemics; and similarly E gives the means of eliminating from A the influence of the cholera epidemics of 1848—1849, 1854, and 1866. The columns C to G inclusive are for comparing the quantities of particular kinds of deaths caused in each of the places in the two compared periods. Such 'special death-rates,' used with caution, yield the most useful of all conclusions as to changes wrought in the public health.

From the table, which is fraught with the most valuable information, in the most condensed form, we learn that, omitting the influence of cholera, there has been a diminution in the death-rate in all but five cases, where the rate has been stationary. In four of the towns—viz., Cardiff, Newport (Mon.), Macclesfield, and Croydon—the reduction amounted to 24, 23, 20, and 18½ per cent. With regard to the *contagious diseases, small pox*, which is capable of being rooted out by an efficient system of vaccination, is not noticed here, and *typhus fever* has scarcely occurred in the towns selected for inquiry. The time has hardly come for estimating the effect of works of sewerage and water-supply upon measles, scarlatina, and hooping-cough, inasmuch as epidemics of these diseases may revolve in long periods. *Measles* and *hooping-cough* seem, however, to have slightly declined. *Typhoid* has very much diminished with the ample supply of good water, and the purification of the atmosphere from decomposing organic matter, by the abolition of cess-pools, by draining, &c. In Salisbury, Stratford, Croydon, and Merthyr, the annual death-rate from typhoid has diminished 75, 67, 63, and 60 per cent. respectively; and in all the towns except three there was more or less diminution. In these exceptional cases, it was found that sewage gases were, by a defect of the outfall arrangement, forced into the houses.*

Diarrhœa appears to have been reduced by purification of air and water. Removal of subsoil water has not affected it. While in three towns the death-rate from this disease has been diminished 50 per cent. or more, in Ashby it has increased 100, and in Rugby, 200 per cent. These anomalous results are ascribed to the prevalence of the disease in the respective workhouses. *Cholera epidemics* appear, says Dr. Buchanan, to have been rendered practically harmless in the towns examined, as may be seen by the comparison of the death-rates per 10,000 in the three last epidemics:

	1848—1849.	1854.	1866.
Merthyr	267	84	20
Cardiff	208	66	15½
Alnwick	205	..	..
Salisbury	180	14½	..
Newport	112	1½	12
Brynmawr	100	..	..

Pulmonary phthisis has diminished in certain of the towns, and the diminution seems due to the drying of the soil, which has in most cases accompanied the laying of main sewers; and the greater the influence of the sewerage in drying the subsoil is, so much the greater is the diminution of the death-rate from this disease. At Salisbury, it is 49 per cent. of its former rate; at Ely, 47; at Rugby, 43; at Banbury, 41; and at Worthing, 36. Failure to reduce consumption is most observable either where the soil already contained little water, or where—the town water passing by the surface or in superficial drains—the deep drainage consisted of impervious pipes, laid down in compact channels, so that no extensive drainage of water could occur either through or alongside of them.

It does not seem that the sewerage of towns, by the removal of excreta and house-slops, has acted to reduce the amount of their death-rate by consumption. *Diseases of the lungs* other than consumption have undergone no regular reduction. Dr. Buchanan concludes this most valuable Report with the observation that the progress made by the inhabitants of most of the towns in decency, cleanliness, self-respect, and morality, was at the least as striking as the improvement in their health, measured by the mortality returns.

* In an article on 'Public Health,' in the *Quarterly Journal of Science* for January 1868, it is stated that at Sandown, in the Isle of Wight, which is thoroughly drained and well supplied with pure water, the death-rate for the last five years has been only 11 in 1000. As a contrast, we may take the village of Child's Hill, in the parish of Hendon, in which there is no efficient drainage, and where the open cesspools connected with the privies often overflow into the ditches and discharge their contents into the river Brent. Here, out of an entire population of 1000, there were 70 deaths in 1867, mainly from epidemic typhoid.

† We have already mentioned that the death-rate at Liverpool not very long ago reached 70; see also the preceding note.

‡ As in the year 1865, the population of England was 20,990,946, while the deaths were 490,909; the general death-rate for that year is 23·4. If this rate could have been reduced to 15, the number of lives thus saved in that year would have amounted to 176,324!

§ Twenty-five towns were visited, but we have omitted Ottery St. Mary, because it seems to have yielded no information.

* Worthing is the town in which the increase of fever is greatest, and this need not excite surprise when we learn that on the side of the water-tower of the town is a shed containing the engine which performs the double duty of distributing the water to the houses and the sewage to the land. To enable this to be effected, there are two wells within 50 feet of one another, sunk in a porous soil, one for the reception of the sewage, and the other for the drinking-water. Moreover, the water-well is in bad condition, and the water supply is neither constant nor sufficiently abundant. See article in *The Medical Press*, 1867. [Happily, this has been amended, and Worthing is now a noted watering-place, the utmost care being devoted to the water supply and sanitary arrangements.]

TABLE ILLUSTRATING THE IMPROVEMENTS OF PUBLIC HEALTH WHICH RESULT FROM PROPER WORKS OF DRAINAGE AND WATER SUPPLY.

Population in 1861.	Towns in Order of their Population.	Periods for which the Death-rates are compared.		DEATH-RATES PER ANNUM, TOTAL AND PARTICULAR, PER 10,000 OF GENERAL POPULATION, FOR EACH OF THE COMPARED PERIODS.

In various articles on special disorders, as Scurvy, Small-pox, and Typhoid Fever, we have pointed out how completely they are under the control of sanitary or dietetic measures. In his excellent chapter 'On the Prevention of Diseases in the Army,' Dr. Parkes gives the following list of diseases, with the methods to be adopted for their prevention—viz.: (1) *Specific Diseases*—paroxysmal fevers, yellow fever, cholera, typhus exanthematus, bubo plague, typhoid fever, relapsing fever, bilious remittent fever, eruptive fevers, erysipelas, hospital gangrene; and (2) *Non-specific Diseases*—dysentery and diarrhœa, liver disease, insolation, phthisis, scurvy, military ophthalmia (gray granulations on the palpebral conjunctiva), and venereal diseases.*

It is the miasmatic diseases which form the first order of the class of zymotic diseases, which seem most under our control. We have shown in a previous page that recent researches tend to show that various of these diseases owe their origin to fungi. We shall conclude this imperfect sketch of the history, progress, and results of sanitary science with a history of the recently-discovered *cholera-fungus*, and with a notice of the other recent scientific investigations regarding the nature and prevention of this disease (which may be regarded as a supplement to the article CHOLERA). At the international congress held at Weimar, in 1867, the cholera-fungus was the great center of interest. The subject had been investigated by Professors Hallier and De Bary, two of the leading German mycologists, and the latter drew up a Report, the following abstract of which is given by Mr. Simon*: 'Both observers find in cholera evacuations, and in the intestinal mucus of the dead body, definite organic structures, zoogloea, consisting of excessively fine granules, clustered more or less densely in the interspaces of a jelly, which more or less abundantly surrounds them. The granules divide and subdivide themselves, to form beaded threads, which interlace, in immense numbers, into felted masses in the mucus.

'The further development of these organisms has yet to be determined. Dr. Thomé, by sowing them, has got, after some time, larger, round, cell-like bodies, which rapidly multiplied, and also abundant filamentous fungi (*cylindro-tænium*), on which grew cylindrical spores, capable of developing again to filaments. Views as to the mutual relations of these cells, filaments, and spores, are for various reasons to be expressed only with reserve; and the study of them is so immensely difficult, that definite results cannot at once be expected. The significance of these fungi would be greatly increased if they should be shown to exist in the

* In connection with diseases or affections which may be totally, or in a very great measure prevented, is short-sightedness. Dr. Cohn, of Breslau, has examined the eyes of 10,060 school-children, out of which number 1730, or 17·1 per cent., were found to be short-sighted. No village-children were affected until they had been at least half a year at school. Dr. Cohn attributes the evil, in a great measure, to the bad construction of the school-benches, which force the children to read with their books close to their eyes, and with their heads inclining downwards.

* A much fuller abstract (by Dr. Buchanan) of Professor Hallier's recent researches into the natural history of the cholera contagion, as contained in his pamphlet, entitled *Der Cholera-Contagion: Botanische Untersuchungen, Aertzen und Naturforschen mitgetheilt*, 1867, is given in pp. 512—515 of the Appendix to Mr. Simon's Ninth Report, to which that able pathologist, has added a most instructive note on the earlier microscopic observations that had been instituted, especially by our own countryman, on the cholera evacuations. On the subject of cholera the reader should also consult Dr Parkes's *Sanitary Report (Army Medical Department) for* 1865 (published in 1867), in which he discusses the recent additions to our knowledge of (1) The specific cause of cholera—the cholera-fungus; (2) The spread of cholera by intercourse; (3) Its communication by the so-called premonitory diarrhœa; (4) its spread by the agency of water; (5) and its prevention by disinfecting the discharges by means of carbolic acid, sulphate of iron, and salts of zinc.

blood as well as in the bowels of the sick; but this, though from some inquiries it seems probable, must at present be deemed questionable.' It has been since ascertained that this fungus requires a high temperature (86° to 112° F.) for its fructification, and therefore, cannot be of European origin. 'It cannot,' adds the same high authority, 'be too distinctly understood that the person who contracts cholera in this country is *ipso facto* demonstrated, with almost absolute certainty, to have been exposed to excremental pollution; that what gave him cholera was (mediately or immediately) cholera-contagium discharged from another's bowels; that, in short, the diffusion of cholera among us depends entirely upon the numberless filthy facilities which are let exist, and specially in our larger towns, for the fouling of earth, and air, and water, and thus, secondarily, for the infection of man, with whatever contagion may be contained in the miscellaneous outflowings of the population.

'Cholera, ravaging here at long intervals, is not Nature's only retribution for our neglect in such matters as are in question. Typhoid fever and much endemic diarrhœa are, as I have often reported, incessant witnesses to the same deleterious influence; typhoid fever, which annually kills some 15,000 to 20,000 of our population, and diarrhœa, which kills many thousands besides.'

We may further refer to the French treatises on hygiene by Becquerel, Levy, Tardieu, and Vernois; but the best in any language is that of Dr. Parkes, from which we have, with the author's permission, freely borrowed.

[Sanitary science, diverging for a little into the sphere of the possible, has depicted a new earthly paradise, which has interested the British public all the more, that it is proposed to plant it on English ground. In a lecture delivered at the Brighton meeting of the Social Science Association in 1875, Dr. B. W. Richardson gave an ingenious and happy sketch of a model and ideal City of Health, perfect in its sanitation, where the death-rate would be infinitely lessened, and where all preventible diseases would be well-nigh stamped out. As described by Dr. Richardson, *Hygeia*, the City of Health, might contain a population of 100,000, living in 20,000 houses, built on 4000 acres of land, with an average of twenty-five persons to an acre. The houses, which in the business part of the town must not exceed 3 or 4 stories in height, would rest on arches of solid brick-work, and as there would be no lower kitchens or areas, the space would be used as a passage for air. The main thoroughfares might consist of three wide streets, running east and west, crossed by others from north to south. Trees would be planted at the side of the pathways. Beneath the main streets would run a sub-way or railway, along which the heavy traffic would pass. The spaces at the backs of the houses would be all gardens.

The houses of the wealthy and all the public buildings standing apart would be surrounded with garden spaces, adding to the beauty and healthfulness of the city. The streets could be paved with wood set in asphalt, all accumulations of mud being washed away every day. In the dwellings themselves, the living-rooms ought to begin on the level of the street; the bed-rooms be on the first floor; and the kitchen, which is well lighted, be placed immediately below the roof. The roof itself would be but slightly arched, and almost flat, with a railing around it, and be available for the cultivation of flowers and other like purposes. The smoke, passed through a gas-furnace, would be sent into the air colorless and robbed of its carbon. The gas, water, and other pipes must pass along sub-ways, and so be easily accessible. An abundant supply of pure water would be introduced by iron, not leaden pipes. Ventilation would of course be elaborately provided for. The sewage, conveyed from the city by pipes copiously flushed, would be utilized at a distance therefrom. Any factories which could be called a nuisance would be placed outside the town. The unhealthy habit adopted by some workmen of working in their own homes would be forbidden and rendered unnecessary, small workshops being made available for their use at a moderate rent. Hospitals for the sick would be small and numerous, entirely detached from other dwellings, and easily removable. Ample provision would be made for baths, gymnasia, schools of all kinds, lecture-halls, libraries, and places of amusement. The town would not contain one single public-house or tobacconist's shop, neither stimulants nor sedatives being required or desired by the healthy and happy Hygeians.

To sum up the results of the system, infantile diseases would be unknown; typhus, typhoid fever, and cholera would cease to exist; and those diseases which arise from change of temperature and uncontrollable causes would be much mitigated. The death-rate would, according to Dr. Richardson's startling estimate, be reduced to 8 per thousand in the first generation, and 5 in the next. Even in Hygeia, men would, however, die at last; and when dead, would not be 'cremated,' but, in their shrouds only, or in basket-coffins, be laid to rest in cemeteries of artificially prepared soil. Some steps have been taken towards realizing this model City of Health, a site having been secured to the west of Worthing, in Sussex, at a cost of £30,000].

SA'NJAK, a Turkish word signifying 'a standard,' is employed to denote a subdivision of an *eyalet* (q. v.), because the ruler of such a subdivision, called *sanjak-beg*, is entitled to carry in war a standard of one horse-tail. The sanjak is frequently called a *liva*, and its ruler a *mirmiram*.

SANJAK-SHERIF. See FLAG OF THE PROPHET.

SAN JOAQUI'N, a river of California, U. S., rises in the Sierra Nevada, and runs first south-west to its junction with the outlet of Lake Tulare, thence north-west to its junction with the Sacramento River, 50 miles from the Bay of San Francisco. It receives numerous branches from both the coast range of mountains and the Sierra Nevada. Entire length 350 miles, for only a small portion of which it is navigable for large vessels.

SAN JOSE', a town of California, U. S., 40 miles S.-E. of San Francisco, with a considerable trade and some manufactures. Pop. (1870) 9089; (1880) 12,567.

SAN JOSE', the capital of Costa Rica, Central America, midway between the Pacific and Atlantic oceans. It stands on a tableland 4500 feet above sea-level, contains a number of important institutions, and carries on an active trade. Its port is Punta Arenas, on the Pacific coast. A line of railway, to connect S. J. with Punta Arenas and with Limon on the Atlantic, is partly made. Pop. 12,000.

SAN JUA'N DE PO'RTO RI'CO. See PUERTO RICO.

SAN JUAN DE LA FRONTE'RA, a town of the Argentine Republic, the capital of a province of the same name in the extreme west of the Republic. The town, 660 miles north-west from Buenos Ayres, stands on the right bank of a river, also called San Juan de la Frontera, which rises in the Andes, and falls into the large salt lake of Guanacache. The province is as yet only very partially settled, but exports considerable quantities of fruits and wine. The chief seat of trade is this town, which has a pop. of 20,000, almost one-third of that of the whole province.

S'ANKARA, or S'ANKARACHARYA, i. e., the *âchârya*, or spiritual teacher, S'ankara, is the name of one of the most renowned theologians of India. His date, as is the case with most celebrities of that country, is unknown. Tradition places him about 200 B C., but H. H. Wilson assigns him, with more probability, to the 8th or 9th c. after Christ. With regard to his place of birth and to his caste, most accounts agree in making him a native of Kerala or Malabar, and a member of the caste of the Nambûri Brahmans. In Malabar, he is said to have divided the four original castes into seventy-two, or eighteen subdivisions each. All accounts represent him as having led an erratic life, and engaged in successful controversies with other sects. In the course of his career, he founded the sects of the *Das'nâmi-Dan'd'ins* (see S'AIVAS). Towards the close of his life, he repaired to Cashmere; and finally to Kedârnâth, in the Himalaya, where he died at the early age of 32. His principal works, which are of considerable merit, and exercised a great influence on the religious history of India, are his commentary on the *Vedânta* (q. v.) Sûtras, and his commentaries on the *Bhaga vadgîtâ* and the principal *Upanishads* (q. v.).

His learning and personal eminence were so great, that he was looked upon as an incarnation of the god S'iva, and was fabled to have worked several astounding miracles. One of these was his animating the dead body of a King Amaru, in order to become temporarily the husband of the latter's widow, so as to be able to argue with the wife of a Brahman Mandana upon the topic of sensual enjoyments—the only topic on which he had remained ignorant, as he had always led the life of a Brahmachârin, or bachelor student. A number of works are current in the south of India relating to his life; among these, the *S'ankara-dig-vijaya*, or the conquest of the world by S., composed by *Anandagiri*, one of his disciples, is the most important.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus;* works, vol. i. (edited by Dr. R. Rost, 1862), pp. 197. ff.; and Cavelly Venkata Ramaswami. *Biographical Sketches of Deccan Poets* (Bombay, 1847).

SANKHYA (from the Sanscrit *sankhyâ*, synthetic reasoning) is the name of one of the three great systems of orthodox Hindu philosophy. See SANSCRIT LITERATURE. It consists of two divisions—the Sânkhya, properly so called, and the YOGA (q.v.); and like the other systems (see MIMANSA and NYAYA), it professes to teach the means by which eternal beatitude, or the complete and perpetual exemption from every sort of ill, may be attained. This means is the discriminative acquaintance with *tattwa*, or the true principles of all existence, and such principles are, according to the Sânkhya system, the following twenty-five: (1), *Prakr'iti* or *Pradhâna*, substance or nature; it is the universal and material cause; eternal, undiscrete, inferable from its effects; productive, but unproduced. Its first production is (2) *Mahat* (lit. the great), or *Buddhi* (lit. intellect), or the intellectual principle, which appertains to individual beings. From it devolves (3) *Ahankâra* (lit. the assertion of 'I'), the function of

which consists in referring the objects of the world to one's-self. It produces (4—8) five *tanmâtrâ*, or subtle elements, which themselves are productive of the five gross elements (see 20—24).

Ahankâra further produces (9—13) five instruments of sensation—viz., the eye, the ear, the nose, the tongue, and the skin; (14—18), five instruments of action—viz., the organ of speech, the hands, the feet, the excretory termination of the intestines, and the organ of generation; lastly (19), *manas*, or the organ of volition and imagination. The five subtle elements (see 4—8) produce (20—24) the five gross elements—viz., *ákás'a*, space or ether, which has the property of audibleness, is the vehicle of sound, and is derived from the *sonorous* tanmâtrâ; air, which has the properties of audibleness and tangibility, is sensible to hearing and touch, and is derived from the *aërial* tanmâtrâ; fire, which has the properties of audibleness, tangibility, and color, is sensible to hearing, touch, and sight, and is derived from the *igneous* tanmâtrâ; water, which has the properties of audibleness, tangibility, color, and savor, is sensible to hearing, touch, sight, and taste, and is derived from the *aqueous* tanmâtrâ; lastly, earth, which unites the properties of audibleness, tangibility, color, savor, and odor, is sensible to hearing, touch, sight, taste, and smell, and is derived from the *terrene* tanmâtrâ. The 25th principle is *Purusha*, or soul. It is neither produced nor productive; it is multitudinous, individual, sensitive, eternal, unalterable, and immaterial. The union of soul and nature takes place for the contemplation of nature, and for abstraction from it, 'as the halt and the blind join for conveyance and guidance, the one bearing and directed, the other borne and directing.' From their union, creation is effected. The soul's wish is fruition or liberation.

In order to become fit for fruition, the soul is in the first place invested with a *linga-s'arîra*, or *súkshma-s'arîra*, a subtle body, which is composed of *buddhi* (2), *ahankâra* (3), the five *tanmâtrâs* (4—8), and the eleven instruments of sensation, action, and volition (9—19). This subtle body is affected by sentiments, but being too subtle to be capable of enjoyment, it becomes invested with a grosser body, which is composed of the five gross elements (20—24), or, according to some, of four, excluding *ákás'a*, or, according to others, of one alone—viz., earth. The grosser body, propagated by generation, perishes; the subtle frame, however, transmigrates through successive bodies, 'as a mimic shifts his disguises to represent various characters.' Some assume, besides, that between these two there is intermediately a corporeal frame, composed of the five elements, but tenuous or refined, the so-called *anusht'hâna s'arîra*.

Creation, resulting from the union of Prakr'iti (1) and Purusha (25), is *material*, or consisting of souls invested with gross bodies, and *intellectual*, or consisting of the affections of intellect, its sentiments or faculties. *Material creation* comprises eight orders of superior beings—gods, demigods, and demons; five of inferior beings—quadrupeds, birds, reptiles, fishes, and insects; besides vegetable and inorganic substances, and man, who forms a class apart. This material creation is again distributed into three classes: that of *sattwa*, or goodness, comprising the higher gods, with virtue prevailing in it, but transient; that of *tamas*, or darkness, where foulness or passion predominates; it comprises demons and inferior beings; and between these, that of *rajas*, or impurity (lit. colored condition), the human world, where passion together with misery prevails. Throughout these worlds, soul experiences pain, arising from death and transmigration, until it is finally liberated from its union with person.

Intellectual creation comprises those affections which obstruct, disable, content, or perfect, the understanding; these amount to fifty. *Obstructions* of intellect are error, conceit, passion, hatred, fear, severally subdivided into 62 species. *Disability* of intellect arises from defect or injury of organs, such as deafness, blindness, &c., and from the contraries of the two next classes; making a total of 28 species. *Content* is either internal or external—the one fourfold the other fivefold. Internal content concerns nature, proximate cause, time, and luck; external content relates to abstinence from enjoyment upon temporal motives—viz., aversion to the trouble of acquisition, or to that of preservation, and reluctance to incur loss consequent on use, or evil attending on fruition, or offence of hurting objects by the enjoyment of them. The *Perfecting* of intellect comprises eight species; it is direct, as preventing the three kinds of pain; or indirect, such as reasoning, oral instruction, amicable intercourse, &c.

Besides the 25 principles, the Sânkhya also teaches that nature has three essential *gun'as*, or qualities—viz., *sattwa*, the quality of goodness or purity; *rajas* (lit. coloredness), the quality of passion; and *tamas*, the quality of sin or darkness; and it classifies accordingly material and intellectual creation. Thus, four properties of intellect partake of goodness or purity—viz., virtue, knowledge, dispassionateness, and power; and four, the reverse of the former, partake of sin or darkness—viz., sin, error, incontinency, and powerlessness. It is worthy of notice that by power the Sânkhya understands eight faculties—viz., that of shrinking into a minute form, to which everything is pervious; of enlarging to a gigantic body; of assuming extreme levity; of possessing unlimited reach of organs; of irresistible will; dominion over all beings, animate or inanimate; the faculty of changing the course of nature; and the ability to accomplish everything desired. The knowledge of the principles, and hence the true doctrine, is, according to the Sânkhya, obtained by three kinds of evidence—viz., perception, inference, and right affirmation, which some understand to mean the revelation of the Veda and authoritative tradition.

It will be seen from the foregoing summary that the Sânkhya proper does not teach the existence of a supreme Being, by whom Nature and Soul were created, and by whom the world is ruled. It was therefore accused by its opponents to be atheistical, or to deny the existence of a creator; and it is the special object of the *Yoga* system to remove this reproach, by asserting his existence, and defining his essence (see YOGA). The truth however, is, that the Sânkhya proper merely maintains that there is no proof for the existence of a supreme Being; and the passages quoted by the opponents, to show that the founder of the Sânkhya *denied I's'wara*, or a supreme God, are quite compatible with the view, that he confined his teaching to those *tattwas* or principles which, in his opinion, were capable of demonstration. Nor is it at all probable that the founder of the orthodox Yoga would have propounded his system as supplementary to that of the Sânkhya proper, had there been that incompatible antagonism between them which must separate an atheistical from a theistical philosophy. The Sânkhya system underwent a mythological development in the Purân'as (q. v.), in the most important of which it is followed as the basis of their cosmogony. Thus, *Prakr'iti*, or nature, is identified by them with *Mâyâ*, or the energy of Brahmâ; and the Matsya-Purân'a affirms that *Buddhi*, or *Mahat*, the intellectual principle, through the three qualities, goodness, passion, and sin, 'being one form, becomes the three gods, Brahmâ, Vishn'u, and S'iva.' The most important development, however, of the Sânkhya is that by the Buddhistic doctrine, which is mainly based on it.

The Sânkhya system is probably the oldest of the Hindu systems of philosophy; for its chief principles are, with more or less detail, already contained in the chief Upanishads (see VEDA); but whether the form in which it has come down to us, and in which it is now spoken of as *the* Sânkhya, is also older than that in which the other systems are preserved, is a question as yet not solved by Sanscrit philology. That this form, however, is not the oldest one, is borne out, for instance, by the differences which exist between the Sânkhya doctrine of the Upanishads and the doctrine propounded in the first book of the Institutes of Manu on the one side, and the doctrine of the actual Sânkhya on the other.

The reputed founder of the actual Sânkhya is *Kapila* (lit. *tawny*), who is asserted to have been a son of Brahmâ, or, as others prefer, an incarnation of Vishn'u. He taught his system in Sûtras (q. v.), which, distributed in six lectures, bear the name of *Sânkhya-Pravachana*. The oldest commentary on this work is that by *Aniruddha;* another, is that by *Vijnânabhikshu*. The best summary of the Sânkhya doctrine is given by I's'wara Kr'ishn'a, in his *Sânkhya-Kárikâ*, edited by H. H. Wilson, with a translation of the text by H. T. Colebrooke, and a translation of the commentary of Gaud'apâda by himself (Oxford, 1837). For the various theories concerning the word Sânkhya, and the founder of the system, Kapila, and for the literature relating to it, see the elaborate and excellent preface by Fitzedward Hall to his edition of the *Sânkhya Pravachana*, with the commentary of Vijnânabhikshu, in the *Bibliotheca Indica* (Calcutta, 1856); and see also his valuable *Contribution towards an Index to the Bibliography of the Indian Philosophical Systems* (Calcutta, 1859). Amongst essays on the Sânkhya philosophy, the most reliable still remains that by H. T. Colebrooke, reprinted from the *Transactions* of the Royal Asiatic Society, in his *Miscellaneous Essays* (London, 1837), vol. i. p. 227, ff.

SAN LU'CAR DE BARRAME'DA, a seaport of Andalusia, in the modern province of Cadiz, and 18 miles north of the port of that name, stands on a sandy, undulating tract on the left bank of the Guadalquivir, and at the mouth of that river. It is a dull decaying place, and is notable chiefly as the mart whence inferior and adulterated vintages are exported to England as sherries. Pop. 23,000.

SAN LU'IS DE LA PU'NTA, the chief town of the province of San Luis in the Argentine Republic, is situated 445 miles west-north-west from Buenos Ayres, on a river, which falls into the large salt lake of Bevodero. S. has some trade in horses, hides, and furs. Pop. above 5000.

SAN LU'IS POTO'SI, a considerable town of Mexico, capital of the state of the same name, stands near the source of the river Tampico, and 200 miles west of the port of that name on the Mexican Gulf. It stands on a plateau 6350 feet above sea-level, is well built, containing many handsome edifices, chiefly ecclesiastical, and is surrounded by gardens. Its markets are well supplied, and

it carries on a considerable trade with the neighboring states. Shoes, hats, and hardware are the chief manufactures, and woven fabrics and liquors are imported from Tampico. Pop. 34,600.

SAN MA'RCO IN LA'MIS, a town of South Italy, in the province of Foggia, 18 miles north-north-east of Foggia. It has some trade in corn, wine, oil, and silk. Pop. above 15,000.

SAN MARI'NO. See MARINO, SAN.

SAN MATE'O, a town of Venezuela, South America, in the department of Cumana, and 50 miles south-south-west of the town of that name. Pop. 7000.

SAN MIGUE'L, a town of Central America, in San Salvador, and about 80 miles east of the city of that name. It is said to be the chief trading town in Central America. At its annual fair of La Paz, 15,000 strangers assemble, and business to the amount of 2,000,000 dollars is transacted. About five miles west of S. M. is a volcano, 6680 feet high, which was in a state of eruption in 1848, and again in 1855. Ordinary pop. 10,000.

SAN MINIA'TO, a city of Central Italy, province of Florence, and 21 miles west-south-west of the city of that name. S. M. is a fine old episcopal city, adorned with many monuments, and is famous in the history of the Florentine Republic. Pop. 2785.

SANNAZARO, JACOPO, a distinguished Italian poet, of Spanish descent, was born at Naples, July 28, 1458. Love for a young lady called Carmosina Bonifacia, whom he has celebrated under the names of Harmosine and Filli, was what developed his poetical faculty. The lady being insensible to his passion, he sought to forget her in travel. It was during his absence that he composed the *Arcadia*, a medley of prose and verse, of which Tiraboschi, the historian of Italian literature, thus speaks: 'The elegance of the style, the propriety and the choiceness of the expressions, the descriptions, the imagery—everything, in fact, is fresh and original.' The work was greatly admired, and in the course of a century went through sixty editions. It has given its author the reputation of being an Italian classic. S., after his return to Italy, was invited to the Neapolitan court, and composed some comedies for the amusement of the royal family, of which only one has been preserved. He died at Naples in 1530 or 1532. His other productions are *Sonetti e Canzoni*, *Eclogæ VI.* (reckoned by some his most perfect performance); *Elegiarum Libri III.; De Morte Christi ad Mortales Lamentatio;* and *De Partu Virginis, Libri III.*, mostly written in Latin verse. S.'s life has been written by Crispo and J. A. Volpi. See also Tiraboschi's *Storia della Letterat. Ital. VII. Part* iii.

SAN NICA'NDRO GARGANICO, a town of Southern Italy, in the province of Foggia, 26 miles north of the city of Foggia. Pop. 8186. It is situated on Mount Gargano, and is one of the most populous towns among those mountains. The lands belonging to it are very fertile, and great herds of cattle and sheep are reared there. It trades in grain, wool, and wine.

SAN NI'COLAS, or SAN NICOLAO, one of the Cape Verd Islands (q. v.).

SANPO. See DIHONG, BRAHMAPUTRA.

SAN RE'MO, a city of Northern Italy, province of Porto Maurizio, 27 miles east-north-east of Nice. It is built on the slope of a rising ground on the shores of the Mediterranean. Its fine cathedral, the Santuario della Guardia, and the Santuario dell' Assunta are worthy of notice, the last having four handsome pillars of alabaster. The palace of the Marquis Borrea D'Olmo contains a fine picture-gallery. There is a seminary for priests, besides a college and many schools. Its little harbor carries on a brisk trade in oils and lemons. Nine foreign consuls reside in the town. S. R. is an ancient city, and obscure in its origin. In 1170, it was self-governed, and made an alliance with the Genoese against the Pisans. One of its bishops afterwards sold it to Genoa. 'San Remo is perhaps the mildest situation on all the Riviera. Here palms, lemon, and orange-trees grow with the greatest luxuriance, and the fruit of the date palm almost attains maturity.'—Murray's *Handbook*. In recent years, it has begun to be resorted to by English visitors, and several new and excellent hotels have been erected. Pop. (1881) 16,055.

SAN ROQUE, a town of Spain, in the modern province of Cadiz, on the bay of Gibraltar, and eight miles north-north-west of the town of that name. The salubrity of the climate, and the cheapness of living, have attracted hither many foreign families, especially English. Pop. (1877) 8729.

SAN SALVADO'R, the smallest, though the second in point of population, of the Central American Republics (see AMERICA), consists of a strip of territory stretching along between Honduras and the Pacific, and bounded on the W. by Guatemala, and on the E. by Fonseca Bay, which separates it from Nicaragua. It averages 180 miles in length, by about 40 in breadth, and contains an area of 7230 English sq. m., with a population (according to the census of 1878) of 482,422, or 67 to the square mile. The northern frontier is formed by a portion of the great Cordillera chain, and parallel to this range, and between it and the Pacific sea-board, runs another range of mountains along the whole length of the country, breaking it up into an inland valley, and a long low rich belt along the coast. This central range is highly volcanic in character, and has 16 volcanic peaks ranging in height from 7386 to 4000 feet high. S. S. possesses numerous lakes, the largest of which is Guija, about 90 miles in circumference and abounding in fish. The greater portion of the interior valley, and the alluvial strip lying along the coast, are of extreme fertility, and agriculture is extensively and successfully practised, to the almost total exclusion of pastoral pursuits. The principal agricultural products are indigo, sugar, and maize, cotton also being successfully cultivated in the districts around La Libertad, and the Bay of Jiquilisco. The coast from Acajutla (30 miles from the western frontier) to La Libertad is known as the *Costa del Balsamo*, or Balsam Coast, as in the woods of this district is produced the famous balsam known as 'Balsam of Peru,' in such quantities that from 17,600 to 22,000 lbs. av. are annually exported. The mineral wealth of S. S. is not great, but rich veins of silver are found at Tabanco in the north-east, and mines of iron in the west near Santa Ana. S. S. has considerable export trade in indigo (which is known in trade as 'indigo of Guatemala,' and is reckoned the finest of all) and sugar, as well as turpentine, cocoa, cotton, and spices. The annual value of exports amounts to about 3,200,000 dollars, and that of imports to 2,000,000 dollars. The revenue is between 2,000,000 and 3,000,000 dollars, the expenditure being a little less. The debt in 1880 was 2,078,885 dollars.

The climate of S. S. is salubrious, and the temperature is lower than might be expected from the low latitude and general want of elevation of the country.

The bulk of the population is composed of Indians and mixed races, there being about 300,000 of the former, and about 190,000 of the latter. There are about 9000 whites (of Spanish origin), and 1000 negroes. The Indians are of the Aztec race, speak the Spanish language, and profess the Roman Catholic religion (the one established by statute), but retain many of their old heathen rites, and live in a certain degree apart from the rest of the population. They have the rights of citizens, but generally exercise them under the advice of the government. The government is carried on by a president, vice-president, and two ministers, one for foreign affairs and finance, and the other for internal business and war. The legislature consists of two chambers, an upper one of 12 senators, and a lower of 24 representatives. Education is well provided for, every village of 50 inhabitants being bound by law to support a school, and there is a university in the capital, San Salvador (q. v.), which is well endowed by the state. The standing army is 1000 men.

S. S. originally called *Cuscatlan*, 'the land of riches,' is said to have been, previous to the immigration of Europeans, the best peopled and most civilized country in America. It was conquered after a long and obstinate contest by Pedro de Alvarado, a lieutenant of Cortes, and under the Spanish rule was one of the most flourishing portions of the Guatemalan kingdom. In 1821, it threw off the yoke, and joined the Mexican Confederation, from which, however, it seceded in 1823. The several trials since made of a union among the Central American States have ended in the dissolution of all political connection; and S. S. is now an independent republic. In 1863, war broke out between S. S. and Guatemala, in which Honduras joined the former, and Nicaragua the latter. The result was the defeat of S. S., and the expulsion of the president from the country. The government has taken active measures towards developing the resources of the country.

SAN SALVADOR, the capital of the republic of San Salvador, was founded in 1589, and supplanted an older town which had been built in 1528 by a brother of Pedro de Alvarado. It was the capital of the Union of Central America from 1823 till 1839. In 1854, it was a fine, well-built city, adorned with numerous splendid buildings, and containing a population of more than 30,000, but on the night of April 16th it was completely destroyed by an earthquake, and about 100 lives lost. In January 1855, it again became the seat of government, and its population is now above 14,000. Violent shocks of earthquake in 1879 and 1880 did damage here and around Lake Ilopango. The trade of S. S. is carried on mostly through the port of La Libertad, which is about five miles distant.

SAN SALVADO'R, or BA'NZA—the former being the Portuguese, and the latter the native name—a town of Africa, the capital of Congo (q. v.). It is 120 miles south-east-by-east from the mouth of the estuary of the river Congo, in a mountainous district near the source of the river Lelunda. Pop. 20,000.

SANSANDI'NG, a large town in the north-west of Africa, in Bambarra, about 20 miles north-east of Sego, on the left bank of the Niger, here called the Joliba. A considerable trade in salt, beads, coral, gold-dust, and cotton cloth is here carried on. Pop. from 10,000 to 11,000.

SANSCARA, or SANSKARA (lit. completing, perfecting), is the name of the ten essential rites or ceremonies of the Hindus of the first three castes. They are the ceremonies to be performed at the conception of a child; on vitality in the fœtus, in the fourth, sixth, or eighth month of pregnancy; and at the time of his birth, before dividing the navel string; the ceremony of naming the child on the tenth, eleventh, or hundred-and-first day; the ceremony of carrying the child out to see the moon on the third lunar day of the third light fortnight, or to see the sun in the third or fourth month; of feeding him in the sixth or eighth month (or at other stated periods); the ceremony of tonsure in the second or third year; of investiture with the string in the fifth, eighth, or sixteenth year—when he is handed to a *guru* to become a religious student; and the ceremony of marriage, after he has completed his studies, and is fit to perform the sacrifices ordained by his sacred writings.

SANSCR'IT, or SANSKR'IT (from the Sanscrit *sam* = Gr. *syn*, 'with, together.' and *kr'ita*, 'done,' with an epenthetic *s*, imparting greater emphasis to the sense of the compound; hence, 'thoroughly done, finished, accomplished') is the name of the ancient language of the Hindus; in which their whole sacred literature, and by far the greatest amount of their numerous ritual, legal, poetical, and scientific works, are written. S. belongs to that stock of languages commonly called the Indo-European, or Indo-Germanic, which includes the Indian, the Medo-Persian, the Græco-Latin, the Germanic, the Lithuanian-Slavonian, and the Gallo-Celtic families. It is therefore intimately allied to the ancient and modern languages comprised in each of these families, itself being the parent of the *Prâkr'it* (q. v.) dialects, the *Pâli* (q. v.), and the languages spoken in the north of India. Compared with the ancient languages kindred with it, S. has come down to us in a state of preservation and development so much superior to theirs, that it must be looked upon as the principal means which enables us to understand the affinity, and in general the linguistic laws which pervade the structure of these languages. The essay of Franz Bopp, *Ueber das Conjugations system der Sanskrit Sprache*, dated 16th May 1816, began a new era in the study of language. See PHILOLOGY, BOPP.

There are two great periods into which the history of the S. language may be conveniently divided: the first embracing the language as contained in the Vedic hymns (see VEDA); and the second, that represented by the so-called classical S.; in which the epic works, the law codes, and the later literature are written. Between the two there is a transition period of the language, to which the Brâhman'a and ritual portion of the Vedas, and the Upanishads, may be assigned. In the language of the Vedic hymns, the grammar is less developed and much less settled than in the classical S.; it contains, moreover, many forms which at the second period became obsolete, or altogether disappeared from use; the structure of its sentences, too, is simpler, though it is more elliptical than in classical poetry. Another main difference between the two periods lies in the sense of its words. Though this is the same in many words of the Vedic hymns and the classical literature, still there are numerous words, which, though the same in form at both periods, have a sense which differs according as it belongs to the one or the other class of writings. The difficulty thus presented by the Vedic hymns is in a great measure removed by the commentators who explain the meanings of the Vedic words, and, in doing so, follow tradition, which, considering the peculiarities of Hindu history, and also internal evidence, is in all probability immemorial, and therefore the safest if not the only guide in the understanding of the oldest Vedic works.

That their explanations may have become unsafe in some instances, would be but natural; but it is certain that these instances are the rare exceptions; and it is likewise certain that when modern Sanscritists—and several of these only imperfectly acquainted with S. grammar,—have attempted to supersede those traditional meanings by interpretations which they suppose better suited to the context, or to some assumed etymology of their own, their rendering may better adapt the Vedic to the classical vocabulary, but is sure to falsify that understanding which the Hindu mind had of its oldest and most sacred works, and on which its further historical development is based. In the transition period of the Brâhman'a and ritual portion of the Vedas and the Upanishads, grammar and vocabulary offer similar difficulties to those of the Vedic hymns; but though for this reason the aid of the commentaries is likewise indispensable, they are much less numerous; and in those works of this extended period, which probably were composed at the classical epoch, the difference between the two is even inconsiderable. In comparing S. with other kindred languages, it is therefore necessary not to lose sight of these periods of the language, and of the peculiarities inherent in them.

SANSCRIT LITERATURE. The most natural, and, at the same time, the most scientific distribution of Sanscrit literature would be that according to the dates at which its writings were composed. The actual condition of Sanscrit philology, however, renders such a course impossible; for, with the exception of very few works, no date whatever is known to which they could be safely assigned. (See INDIA—*Religion;* VEDA.) In spite, therefore, of an apparent plausibility with which some authors have propounded a regular literary chronology of Sanscrit works, even with figures or dates appended to them, the general reader will do well to look upon all such dates as imaginary, and to rest satisfied with the hope, that perhaps future results of Sanscrit philology may afford a more satisfactory settlement of this vexed question of Sanscrit chronology. Under these circumstances, the only possible arrangement of Sanscrit literature is that suggested by their contents, irrespectively of the time at which they were composed, but, under each head, in that order which, within large margins, may be suggestive of consecutiveness.

1. *Religious Literature.*—It comprises, in the first place the Vedas, and the mystical, philosophical, and ritual works connected with them (see VEDA and UPANISHAD); and secondly, the PURAN'AS (q. v.) and TANTRAS (q. v.), besides prayer-books and smaller works, and treatises of less importance relating to the modern worship, based on the two latter classes of works.

2. *Law Literature.*—It is comprised under the name of *Dharmas'âstra* (from *dharma*, law—religious and civil—and *s'âstra*, book), and its origin is traceable to the ritual Sûtras relating to the Vedas. A complete Dharmas'âstra consists of three portions: the first treating of *Achâra*, or 'established rules of conduct,' comprising such matters as education, marriage, the funeral rites, the duties of a king, &c.; the second treating of *Vyavahâra*, or judicature, including law, private and criminal, and under the former, for instance, the law of inheritance and adoption; the third, on *Prâyas'chitta* or penance, treating, besides this subject, also of impurity, the duties of a devotee, transmigration, and final beatitude. The chief extant representatives of this class are the codes of MANU (q. v.) and YAJNAVALKYA (q. v.). Less complete than the latter—for it does not contain the Vyavahâra portion—is the code of PARAS'ARA (q. v.); but it deserves special mention, as the modern Hindus consider it to have been especially composed for the requirements of the Kaliyuga, or the present mundane age, and as it is cited, therefore, as *the* authority, for instance, on the question, and in favor, of the remarriage of Hindu widows.

For practical purposes, especially those concerning Vyavahâra, the chief actual authorities are the commentaries on Manu, *Yâjnavalkya*, and similar works, and the digests which have grown up from them. Amongst the former, the MITAKSHARA (q. v.), by Vijnânes'wara, occupies the principal rank; and amongst the latter, the *Chintâman'i*, *Vîramitrodaya*, *Vyavahâra-mayûkha*, *Smr'itichandrikâ*, and *Vyavahâra-Mâdhavîya*, which generally defer to the authority of the *Mitâksharâ;* and, besides these, the *Dâyabhâga* of Jîmûtavâhana, which, like the *Dâyatattwa* of Raghunandana, differs from it on several important questions, for instance, on that relating to the hereditary rights of women. (See MITAKSHARA). As on the Vyavahâra, there are numerous smaller treatises on the Achâra and Prâyas'chitta.

3. *Poetical Literature.*—(*a.*) The two great epic poems. See RAMAYAN'A and MAHABHARATA.

(*b.*) *The Modern Epic Poems.*—Their subject-matter is entirely borrowed from the two great epic poems and other legendary works; and their only merit consists in the art bestowed by their authors on the versification, and all that relates to the æsthetical canon of Hindu poets, which, in some respects, may meet with the approbation of western critics, but, in others, would require in the European reader a total abnegation of his ideas of poetical beauty, in order to make these poems acceptable to him. Minute descriptiveness, elaborateness of diction, and an abundance of figures of speech, are some of the characteristics of these poems, amongst which those of Kâlidâsa approach nearest our standard of poetical worth. One of them, the *Bhattikâvya*, which relates to the history of Râma, was purposely composed for illustrating rules of grammar and formations of words of special interest. In another, the *Râghava-Pândavîya*, the ambiguity of the diction is so studied, that the poem may be interpreted as relating to the history of Râma, or other descendants of Das aratha (see RAMAYAN'A), or to that of the descendants of Pân'd'u (see MAHABHARATA).

The following are the *Mahâ-kâvya* or great poems of this class: the *Raghuvans'a* and *Kumârasambhava*, by Kâlidâsa (q. v.); the *Nalodaya*, also ascribed, though probably wrongly, to the same poet; the *Bhat't'ikâvya*, or the poem by Bhat't'i; the *S'is'upâlabadha*, by Mâgha, hence also called the *Mâghakâvya;* the *Naishadîyacharita*, by S'rîharsha; the *Kirâtârjunîya*, by Bhâravi; and the *Râghava-Pân'd'avîya*, by Kavirâja (i. e., the prince of poets), as the author calls himself.

(*c.*) *Lyric and Erotic Poetry.*—Several works of this class are more of a descriptive character, and would differ therefore from

what in European poetry might be included under this head. The principal works belonging to it are the following: the *R'itusanhâra*, or a description of the seasons, attributed to Kâlidâsa (q. v); the *Meghadûta*, or the cloud-messenger, also supposed to have been written by Kâlidâsa—a poem in which a demigod, separated by fate from his wife, is imagined to make a cloud the messenger to her of his woes, and incidentally, as it were, describes his course over a large tract of India; the *Amarús'ataka*, or hundred stanzas of Amaru, on amatory feelings and scenes, the natural sense of which commentators have twisted also into one of a mystical character, so as to make them appear less objectionable, especially as they were supposed by some to have been composed by the celebrated theologian S'ankara, when he had animated the dead body of King Amaru (see S'ANKARA); these stanzas have an epigrammatic character, and share in this respect the style of the first S'ataka, or hundred verses on love, by Bhartr'ihari; the *Bhâminîvilâsa*, by Jagannâtha Pan'd'itarâja, in four books, the second of which is connected with amatory subjects, while the third is a beautiful elegy on the death of the poet's wife; the *Gitagovinda*, by Jayadeva, who probably lived in the 12th c., which, in ten sections, describes the amours of Kr'ishn'a with the cowherdesses, his separation from his wife Râdhâ, and his ultimate reconciliation with her, and which, like the *Amarús'ataka*, has also been explained in a mystical sense, Kr'ishn'a then being represented as the soul which for a time becomes estranged from the supreme soul, its original source, but finally returns to it. This poem differs from those mentioned before in being intended for singing and for representation at a festival held in honor of Vishn'u; it combines the lyric and the melo-dramatic character.

(*d.*) *Didactic Poetry.*—A portion of this class of poetry may be included under the former head, since even such works as the *Amarús'ataka*, and the erotic stanzas of *Bhartr'ihari* have much of the sententious character; another is contained in the episodes of the *Mahâbhârata*, and another forms a considerable portion of the books of fables. The chief special representatives of this class are, 'the three *S'atakas*,' or hundred stanzas on love, good and wise conduct, and renunciation of worldly desires, by *Bhartr'ihari*. Similar pieces of poetry are the hundred stanzas of *Chânakya*, and some stanzas in the anthology of *S'arngadhara*, called the *S'arngadharapaddhati*. Others have been collected in various modern anthologies such as the *Nitisankalana* and the *Kavitâmr'itakûpa*. For the poem *Bhagavadgîtâ*, see under YOGA.

(*e.*) *Dramas.*—The plays of the Hindus are not numerous; they were only acted on special occasions, and the subject of the plot is with predilection borrowed from the legendary literature of ancient India. Hindu dramatists have little regard for unity of time, place, and action; and with the exception of Kâlidâsa, they must be considered as inferior in poetical worth to the renowned dramatic writers of ancient Greece and of modern Europe. Besides the reasons to be sought for in the religious, mystical, and metaphysical tendencies of the Hindu mind, a free development of the Hindu drama was probably also impeded by the heavy and artificial canon which weighed upon Hindu dramaturgy, and which, ascribed to sacred sources, and looked upon as a law not to be transgressed by any dramatic poet, did not allow much scope for poetical imagination, and would keep down any free movement upon which it might have ventured.

The various kinds of dramatic performances, the number of their acts, the characters of the plays, the conduct of the plot, the sentiments to be represented, and even the modes of diction—all these were strictly regulated; so much so, that in spite of the differences which must exist between different authors and plays, there is still a kind of uniformity which pervades the whole Hindu drama, and must strike any one unacquainted with this elaborate dramatical canon. It must suffice here to mention a few of its peculiarities. All dramatic composition is divided, according to it, into two great classes—the *Rûpaka* or performance, and the *Uparûpaka*, or the minor *Rúpaka;* the former containing ten species from the *Nât'aka*, or the play *par excellence*, which represents exalted personages, down to the *Prahasana*, or farcical comedy; and the latter with eighteen species. Neither class contains the species 'tragedy'—which is incompatible with a belief in fate, one of the main features of the Hindu mind. Every drama opens with a prelude in the form of a dialogue between the stage manager and one of his company, in which the name of the author and of his work, and such prior events as the spectators should know, are brought before the audience. The first part of this prelude is a prayer invoking the benediction of some deity in favor of the assembly. The piece thus being opened, is then carried on in the usual manner; but so long as the same act lasts, the stage is never left empty, but the entrance of a new personage is always announced by a special person. The piece closes as it began, with a benediction. The principal characters of the play are the hero (*nâyaka*) and the heroine (*nâyikâ*). The former is either *lalita*, gay, thoughtless, and good-humored; or *s'ânta*, gentle and virtuous; or *dhîrodâtta*, high-spirited, but temperate and firm; or *udâtta*, ardent and ambitious; but as each of these categories is again subdivided, they become multiplied to 144 kinds.

Equal minuteness is displayed in specifying the classes of the heroines. The hero has his antagonist in the *pratinâyaka*, or counter-hero; and each of these may have his officers, ministers, and friends. The heroine, on her part, has always a confidential companion, who is often her foster-sister. The subordinate characters are described as being eunuchs, mutes, dwarfs, foresters or barbarians. Two characters, however, deserve special notice, as being peculiar to the Hindu stage—the *Vit'a* and the *Vidúshaka*. The *Vit'a* may be the companion of a man or woman; he is generally on familiar, yet dependent terms, with his associate, and though somewhat like the parasite of the Greek comedy, yet not rendered contemptible; if a female, she is a courtesan. The *Vidúshaka* is the humble companion of a prince or man of rank; he is always lively, sometimes witty, and, according to the definition of his attributes, he is to excite mirth by being ridiculous in person, age and attire. He is, curiously enough, always a Brâhman. The plays have eight, or according to some, nine *rasa*, or characteristic flavors: these *rasas* are love, mirth, tenderness, fierceness, heroism, terror, disgust, wonder, and tranquillity; and they again consist of conditions with numerous divisions and subdivisions. The manner according to which the form of speech is regulated, is another peculiarity of the Hindu drama. Only the hero and the principal personages speak Sanscrit, but women—with rare exceptions—and the inferior personages speak Prâkr'it; the various, higher or inferior, idioms of that language being adapted to their higher or inferior character. See PRAKR'IT. The oldest known Sanscrit drama is the *Mr'ichchhakat'i*, or 'the Clay Cart,' by King S'ûdraka, which, in the opinion of H. H. Wilson—who translated it in his *Select Specimens of the Theatre of the Hindus*—was written in the 1st c. B.C.

Of other dramas may here be mentioned *Abhijnâna-s'akuntala* (see S'AKUNTALA) and *Vikramorvas'i*, by Kâlidâsa (q. v.), to whom also the drama *Mâlavikâgnimitra* is attributed; *Mâlatîmâdhava*, *Mahavîracharita*, and *Uttararâmacharita*, by Bhavabhûti; *Ratnavalî*, by S'rîharsha; *Mudrârâkshasa*, by Vis'âkhadatta; *Hanumannât'aka*, fabled to have been composed by the monkey Hanumat (q. v.); and *Anargharâghava*, by Murâri. A drama of a peculiar nature is the *Prabodhachandrodaya*, by Kr'ishn'amis'ra, who, in the opinion of Goldstücker, expressed in the preface to his translation of this drama, lived at the end of the 12th century. Its leading personages are all of a transcendental kind; such as the supreme spirit, faith in Vishnu, volition, organ of imagination, opinion, devotion, quietude, friendship, &c., on the one side; and error, egotism, hypocrisy, love, voluptuousness, anger, avariciousness, &c., on the other; and its object is to represent the victory of the former over the latter. The general dulness of the play is relieved by a number of sectarian worshipers, who appear on the scene, each eulogising the truth of his own religion, and ridiculing that of his antagonist. That this drama, which would baffle the patience of a European audience, was acted 'before King Kîrtivarman, who, with his whole assembly, was very eager to see it,' the poet relates in the prelude to it. An imitation of this drama is the *Chaitanyachandrodaya*, by Kavikarn'apura. For the translation of several of these dramas, and an account of others, see H. H. Wilson's *Select Specimens of the Theatre of the Hindus* (2 vols., London, 1835).

(*f.*) *Fables and Narratives*—Fables, as such, occur, and are referred to, as early as in the great epic poems; but the oldest *collection* of fables is the *Panchatantra* (q. v.); and after it, the *Hitopades'a* (q. v.). These works are considered by the Hindus to belong to the class called *nîtis'âstra*, or works on conduct and polity, since the morals drawn from the fables, and expressed in sententious verses, with which they are interwoven, are the object for which these collections were made. A different class of writings are the ghost-stories, merely composed for amusement, such as the *Vetâlapanchavins'ati*, or the 25 tales of the vampire; and the *S'ukasaptati*, or the 70 tales of the parrot; and the *Sinhâsanadwâtrins'ati*, or the 32 tales of the statutes on the throne of Vikramâditya. A work of a higher order is the *Vr'ihatkathâ*, 'the Grand Tale,' or *Kathâsaritsâgara*, 'the Ocean for the Rivers of Tales, by Somadeva of Cashmere. Amongst narratives of the romance class, the most celebrated are, the *Das'akumâracharitra*, or the 'Adventures of the Ten Princes,' by Dan'd'in, who lived about the middle of the 11th c., edited, with an elaborate preface, by H. H. Wilson; *Kadambarî*, by Vânabhatta; and the *Vâsavadattâ* by Subandhu, a critical account of which work is given by Fitzedward Hall, in the preface to his edition of it (Calcutta, 1859.

(*g.*) *Chronicles*—Historical works, in the European sense of the word, do not exist in Sanscrit literature. The same causes which have clouded all Hindu chronology, and even, at recent periods of Hindu history, have transformed historical facts into myths, seem to have rendered the Hindu mind indifferent to the research and the recording of *historical* truth. The only approach to historical works is found in some chronicles, though these, also, are

not devoid of fictitious narratives. The most renowned among them is the *Râjataraṅgin'î* (q. v.), or the Chronicle of Cashmere, by Kalhana. A modern work of a similar kind, but of much smaller extent, is the *Kshitîs'avans'âvalîcharita*, or the Chronicle of a series of royal families who reigned in Bengal. It was composed in the middle of the last century.

4. *Scientific Literature.*—(*a.*) *Philosophy.* See the articles SANKHYA, YOGA, NYAYA, VAIS'ESHIKA, MIMANSA, VEDANTA.

(*b.*) *Grammar.*—That a scientific study of grammar was cultivated at a very early period of Hindu literature, is borne out by the testimony of the oldest glossator on the Vedas, YASKA (q. v.). The oldest extant work, however, on Sanscrit grammar is posterior to the work of Yâska; it is the grammar of Pân'ini (q. v.), which was criticised by Kâtyâyana (q. v.) in the *Vârttikas*, these, again, being commented on and criticised by Patanjali in the *Mahâbhâshya*. (See PAN'INI, where some of the principal later works connected with his system are mentioned.) That the *Prâtis'âkhyas* (see VEDA) did not precede the grammar of Pân'ini, has been shown by Goldsücker in his *Pân'ini, his Position in Sanscrit Literature*, &c. Of authors of grammars, not following the technical system of Pân'ini, the principal are, Hemachandra, a Jaina (q. v.) writer, and Vopadeva, who probably lived about six centuries ago, and is especially esteemed in Bengal.

(*c.*) *Lexicography.*—It consists of glossaries of words and *dhâtus*—a term which may be vaguely rendered by 'roots,' or 'radicals,' though it does not imply, to the Hindu grammarian, the idea of a linguistic *element*—and of commentaries on these glossaries. The oldest known glossary of *Vedic* words—nouns and verbs—is the *Nirukta* (q. v.) of Yâska. Renowned glossaries of *classical* words are the *Amarakosha*, by Amarasinha, who is probably not later than the 3d c., after Christ; the *Abhidhânaratnamâlâ*, by Halâyudha; the *Haimakosha*, by Hemachandra; and the *Vis'waprakâsa*, by Mahes'wara. (For other works of this class, see Wilson's *Sanscrit, English Dictionary*, preface to 1st ed. 1819; and Colebrooke's *Miscellaneous Essays*, vol. i. p. 50, ff.) The glossaries of *dhâtus* are called *Dhâtupât'has*. The oldest was probably composed by Pân'ini himself, and is the groundwork of the existing works of this name, though the latter contain numerous additions of later forms. The chief commentary on the *Dhâtupât'ha* is that by the celebrated Mâdhavâchârya (q. v.).

(*d.*) *Prosody.*—Sanscrit prosody admits three sorts of metre: one governed by the number of syllables, and which is mostly uniform or monoschematic, in profane poetry, but not so in various passages of the Vedas; the other regulated by feet equivalent to two long syllables, or to four short; and the third regulated by the proportion of syllabic instants, without noticing the number of feet. Some Sûtras (q. v.) connected with the Vedas contain rules on the Vedic metres; but the principal work on Vedic, as well as profane prosody is the *Chhandah's'âstra*, by Pingala, which has been commented on by various writers, the most conspicuous of whom is Halâyudhabhat't'a. A short treatise on prosody; which only exhibits the most common sorts of metre, the *S'rutabodha*, is attributed, but probably wrongly, to Kâlidâsa (q. v.).

(*e.*) *Art of Poetry.*—It is treated in works on dramaturgy, and works on the poetical art in general. The oldest work on the dramatic art is the *Sûtra* of Bharata; a later one is the *Das'arûpa* by Dhananjaya. Some of the principal works of the latter category are the *Kâvyaprakâs'a*, by Mammat'a, the *Kâvyadarsa*, by Dan'd'in, and the *Sâhityadarpan'a*, by Vis'wanâtha Kaviraja. Several other works of this class are especially concerned in the explanation of figures of speech.

(*f.*) *Works on Music.*—In general, they treat of notes, musical scales, melodies, the art of singing, and musical instruments; and some of them also of the art of dancing and performing. The melodies, or *Râgas*, are represented as deities, who have wives, the *Ragin'îs*. Their number is uniform in the different works, and it is probable that the passages in dramas and other poetical works intended for singing were written to suit these fixed melodies, and not that the melodies were composed after the poet had performed his task. The principal works of this kind are the *Sangîtaratnâkara*, by Sârngadeva, the *Sangîtadarpan'a*, by Dâmodara, and the *Sangîtadâmodara*, by S'ubhankara. Special treatises relate to the melodies alone.

(*g.*) *Amatory Art.*—Works treating of this art purport methodically to explain and to classify all that relates to love, and they refer for many of their statements to the oldest authorities. The chief work on this subject is the *Kâma-Sûtra* of Vâtsyâyana.

(*h.*) *Astronomy and Arithmetic.*—The calendars connected with the Vedas are the earliest evidence of Hindu proficiency in astronomy; they presuppose a knowledge of a solar year of 365 days, and their date is assumed by Colebrooke to belong to the 13th c. B.C., while others would place them a few centuries later. The scientific works of later Hindu astronomers are professedly based on five ancient systems, or Siddhântas, called the Paulis'a-, Romaka-, Vâs'isht'ha-, Saura-, and Paitâmaha-Siddhânta; and the earliest renowned author among these astronomers is Aryabhat't'a, who, according to Colebrooke's calculation, did not live later than the 5th c. after Christ. From the quotations by Brahmagupta, it appears that Aryabhatta 'affirmed a diurnal revolution of the earth on its axis, that he possessed the true theory of the causes of lunar and solar eclipses, and that he noticed the motion of the solstitial and equinoctial points, but restricted it to a regular oscillation, of which he assigned the limit and the period.' See, for further detail, Colebrooke's *Algebra*, &c. (Lond. 1817, p. 38). His principal work, the *Aryâsht'as'ata*, is at present only known from the quotations of Brahmagupta, Bhat't'otpala, and others; but his other works, the *Das'agitikâ* and *Aryabhat't'iya*, are extant. Varâhamihira, the next important astronomical writer, a native of Ujjayini, lived about the beginning of the 6th c. after Christ. His compilation of the five Siddhântas, the *Panchasiddhântikâ*, is not yet recovered; but several of his astrological treatises, and the scholia on them by Bhat't'otpala or Utpala are preserved, and his *Br'ihatsanhitâ* has been recently edited by Dr. H. Kern (Calc. 1865).

Another great astronomical authority is Brahmagupta, who appears to have written towards the close of the sixth, or the beginning of the following century; his work bears the title of *Brahmasiddhânta*, and it was followed up by Bhâskara, who, in the middle of the 12th c., composed a celebrated work, the *Siddhântas'iromanî*, translated by Lancelot Wilkinson (Calc. 1861). The *Sûryasiddhânta* has been edited by Fitzedward Hall (Calc. 1859); and two translations of it are due, one to E. Burgess in the *Journal* of the American Oriental Society, accompanied with notes by Whitney (New Haven, 1860); another to Bâpûdeva S'âstri (Calc. 1861), but whether this Siddhânta is the Saura, one of the five original Siddhântas above mentioned or a later work bearing a similar title, is matter of doubt. That Hindu astronomy is largely indebted for its progress to the kindred sciences of western nations, may be inferred from the occurrence in Sanscrit of terms which are of Arabic and Greek origin. Thus, the terms *horâ, dreshkân'a, liptâ, kendra*, &c., are easily traced to the Greek *hora, dekanos, lepta, kentron*, &c.—That works on Hindu astronomy contain more or fewer chapters or passages which no longer concern astronomy, but belong to the sphere of astrology, can be no matter of surprise, considering the intimate connection in which, in India, religion and superstition stand to every branch of human knowledge, and much more especially to one concern—the heavenly bodies. There are, moreover, numerous works which are purely astrological, merely treating of nativities and the influence of the planets on certain periods of the day or month, and the occurrences that would take place at them. Among celebrated writers on algebra, it must here suffice to name Varâhamihira and Bhâskara. See Colebrooke's *Algebra* as quoted above.

(*i.*) *Medicine.*—The origin of Hindu medicine is referred to the god Brahman, from whom the Ayurveda, or 'the science of long life,' was obtained by Daksha, who communicated it in his turn to the As'wins. Some time after this, mankind, in consequence of their wickedness, becoming afflicted with numerous diseases, the Munis, or saints, met in the Himalaya Mountains to search for a remedy. A long list of these saints is given by *Charaka*, one of the greatest medical writers, and it is so far of interest as it contains several names known in Hindu history, and which thus may be probably connected with the early study of Hindu medicine. The two greatest medical authorities the works of whom are still extant are *Charaka* and *Sus'ruta* (q. v.). Both treat of the duties of physicians and their pupils, of anatomy and physiology; hygeology; materia medica, pharmacy, and preparations of medicine; surgery; the diagnosis, prognosis, and treatment of a considerable number of diseases; midwifery, toxicology, &c. Several chapters in them are devoted to omens and portents, as well as to the evil influence of planets and demons on the human body. Charaka, who is older than Sus'ruta, contains more mythological detail than the latter. Of the authorities quoted by Charaka, Atreya seems still preserved in a work, the *Atreyasanhitâ*, which is far less scientific and complete than either the work of Charaka or Sus'ruta, and therefore appears to have preceded them.—See also T. A. Wise, *Commentary on the Hindu System of Medicine* (London, 1860).

(*j.*) *Architecture.*—Treatises on architecture, sculpture, &c., are collectively called *S'ilpas'âstra*. There appear to have been 32, or, according to some, 64 standard treatises on these arts, but of these only a few are probably still in existence. The most important of them is the *Mânasâra*, which consists of 58 chapters, each of which is devoted to a particular topic—such as measures used in architecture; the different sites to be selected for building temples and houses; the mode of determining the different points of the compass; the several sorts of villages, towns, and cities, with directions for building them; the different parts of an edifice, its ornaments, pedestals, bases, pillars, &c.; the various sorts of temples; the construction of porticoes, gates, palaces, &c.; the construction of images, and cars in which the gods are carried in procession, together with the ceremonies attending the consecra-

tion of images; the mode of determining the propitious moment for commencing to lay the foundation of an edifice, &c. See for further detail, Râm Râz, *Essay on the Architecture of the Hindus* (London, 1834).

For a more copious supply of titles of books on the subjects mentioned, the reader may consult Gildemeister, *Bibliotheca Sanscrita*, Bonn (1847), and the printed catalogues of the Library of the India Office, of the Sanscrit MSS. of the Bodleïan Library at Oxford, and of the Sanscrit MSS. of the Royal Library at Berlin.

SANSCULOTTES, i. e., 'without breeches,' was the name given in scorn, at the beginning of the French Revolution, by the court party to the democratic 'proletaires' of Paris. The latter accepted this superfine reproach with sardonic pride, and the term soon became the distinctive appellation of a 'good patriot,' more especially as such a one often made a point of showing his contempt for the rich by neglecting his apparel, and cultivating rough and cynical manners.—This is the current interpretation in England (as in Carlyle's works); but it should be observed that Littré, the best authority on French etymology, makes no mention of breechlessness in the sense of raggedness in his definition of the word; but, on the contrary, says that the Sansculottes 'were so called because they gave up the knee-breeches in fashion during the *ancien régime*, and took to wearing trousers or pantaloons.' The other notion of raggedness must have been tacked on later by a wilful pun. Towards the close of the Convention, the name, connected as it had been with all the sanguinary excesses of the period, fell into bad odor, and soon disappeared.

SAN SEBASTIA'N, a rising seaport city in the north of Spain, capital of the Basque province of Guipuscoa, 381 miles north-north-east of Madrid by the North of Spain Railway. It is built on a peninsula, at the southern base of a conical hill, called Mont Orgullo, 400 feet high, commanding a most striking view, and crowned with a castle strong enough to have obtained for itself the name of the Gibraltar of the north of Spain. Since its almost total destruction during the Peninsular War, the town has been rebuilt on a regular rectangular plan. The streets are narrow, and are bordered by high houses, and having curtained balconies in front. On the east of the town is a confined gulf, formed by the embouchure of the Urumea; and on the west is a magnificent roadstead, protected against enemy and tempest by the isle of Santa-Clara, and a series of rocks, which offer to vessels only a narrow and dangerous pass.

The roadstead is bordered by a beautiful shore, which, on account of its suitability as a watering-place, attracts visitors from all parts of the country. The town communicates with the mainland by a narrow tongue of land, and by a bridge leading across the Urumea, and connecting S. S. on the peninsula with the railway station on the mainland. By means of the North of Spain Railway, which was inaugurated by the king of Spain, 15th August 1864, the town is placed in direct communication with Madrid and Paris. Commerce increases. Near 200 vessels, of about 50,000 tons, yearly enter and clear the port; annual value of imports, £430,000, and of exports, £73,000. The exports consist principally of wool, flour, wine, cutlery, firearms, copper-ore, and lead; the imports are salted fish, sugar, silk and cotton and linen goods, cocoa, machinery, &c. Pop. (1877) 21,355.

S. S. has suffered from numerous sieges in the wars between France and Spain. The most memorable was that in 1813, when S. S. was defended against Wellington by a French garrison of 3000 men. When the defenders surrendered, 5000 of the English troops had been killed or wounded. The victors, in spite of their officers, but according to the usages of war, committed disgraceful excesses.

SAN SEVERI'NO, a city of Central Italy, province of Macerata, 15 miles west-south-west of the city of that name. It is well built, and has handsome palaces, the finest of which are the Palazzo Comunale, and that of the bishop. The neighborhood produces exquisite wine, oil, and fruit, and cattle are reared on the pasture grounds. Pop. 4700.

SAN SEVE'RO, a city of Southern Italy, province of Foggia, with 16,500 inhabitants, stands in a delightful and fertile open country, producing abundance of grain, tobacco, and wine, and affording rich pasturage. It was once remarkable for the industry and activity of its population. In 1799, it was taken, and nearly destroyed by the French. The cholera committed fearful ravages here in 1865.

SA'NTA A'NNA, or ANA, a town of Central America, in the state of San Salvador, and 32 miles north-west-by-west from the town of San Salvador. Pop. about 10,000.

SANTA ANNA, Don Antonio Lopez de, ex-president of Mexico, was born in Jalapa, in 1798. While a mere youth, he entered the Spanish army, and became lieutenant-colonel in 1821. When Mexico determined to throw off the Spanish yoke, S. A. greatly distinguished himself at the head of the Mexican troops. The Spanish royalists were expelled from Vera Cruz, and he was elected governor of the city and province. Iturbide had established an imperial rule over Mexico (q. v.), but his tyranny having worked his downfall, S. A. proclaimed, in 1822, a Mexican republic, which was recognized by every foreign state except Spain. He was incessantly engaged in quelling the civil wars kindled by the aristocratic and democratic factions. In 1829, he engaged and put to flight a division of Spanish troops which invaded Mexico by way of Tampico, with the view of again bringing Mexico under Spanish rule, The separation of Texas (q. v.) from the Mexican union was vigorously but unavailingly opposed by Santa Anna. In 1837, differences arose with France, and a division of French troops landed at Vera Cruz. They were gallantly engaged by S. A., who drove a portion of them into the sea at the point of the bayonet. In this action he received a bullet in the leg, which rendered the amputation of the limb necessary. In 1838, the French took Vera Cruz, and obtained the settlement of their differences.

In 1847, war having been declared by Mexico against the United States, S. A. took the command of the Mexican forces. He offered a gallant but ineffectual resistence to the troops of Generals Scott and Taylor. The city of Mexico having been stormed and taken by the Americans under General Scott, the war was at an end, and S. A. retired from Mexico. During 30 years he had disputed the direction of affairs with Bustamente, Herrera, Cevallos, and other chiefs of parties, being at one time dictator, and at another disgraced and an exile. In 1853, Mexico, torn by civil dissensions, and falling into anarchy, again recalled Santa Anna. He declared himself president for life, and a civil war was the immediate result. In 1855, he was driven from the country. During the government of Juarez, 1858—1863, S. A. was looked up to as their chief and future ruler by an influential party in Mexico. On the establishment of a hereditary monarchy under Maximilian of Austria as emperor, S. A. returned to Mexico, having first signed an act of adhesion to the empire. He soon, however, began to intrigue for his own return to power, issuing addresses to the people as emperor and was ordered to leave the country. After some residence in the United States, S. A. planned an expedition against Juarez; but ere a landing at Vera Cruz had been effected, S. A., with his secretary, was taken prisoner. He was condemned to death, but pardoned by Juarez, on condition of his leaving Mexico. He afterwards resided on Staten Island, New York, where he spent his time cock-fighting and playing at three-card monté. On the death of Juarez in 1875, he returned to Mexico, where he died in 1876. He was regarded by his countrymen as their ablest general, and he was more successful than any other Mexican ruler in quelling the miserable civil wars, though he sometimes showed unjustifiable cruelty. He was also accused of being greedy of wealth, and unscrupulous in the means of obtaining it. He received the Grand Cross of Charles III. of Spain, and the Grand Cross of the Red Eagle of Prussia.

SANTA CRUZ (Teneriffe), the capital of the Canary Islands (q. v.), and the chief seaport of the group, stands on the north-east side of the island of Teneriffe. Its port, the safest in Canaria, has recently been extended and improved by the construction of two moles, with a united length of about 5400 feet, which enclose a large space of water, affording excellent anchorage in from two to nine fathoms. When completed, these works will be of inestimable value, in a commercial point of view, to the island. The streets of S. C. are broad, the houses whitewashed and flat-roofed, and several of the public buildings striking in appearance. The town is defended by several forts and redoubts. Formerly, large quantities of wine of excellent quality were grown in Teneriffe, and shipped for export at S. C.; now, however, the principal article of export from this, and also from the other islands, is cochineal. Coals from England, together with manufactured goods, hardware, and furniture are imported. Of the imports at S. C., more than a third come from England, and the annual imports amount to about £160,000. Pop. 13,228.

SANTA CRUZ. See Virgin Islands.

SANTA CRUZ DE LA PALMA, the capital of Palma, one of the Canary Islands (q. v.). It stands on the east coast of Palma, on a spacious bay from 7 to 10 fathoms deep. Pop. about 5000, employed partly in manufactures of silks and hosiery.

SANTA FÉ, city and capital of the territory of New Mexico, U. S., built among the Rocky Mountains, on a plain 7047 feet above the sea. It is an old Spanish Mexican town, and contains 4 Roman Chatholic churches, mission churches, and government buildings. It is now connected by rail with St. Louis, and with the Pacific. Pop. (1880) 6635.

SANTA FÉ, a town of the Argentine Republic, on the right bank of the Salado, a large branch of the Parana, 250 miles north-west-by-north from Buenos Ayres. Pop. 15,000.

SANTALA'CEÆ, a natural order of exogenous plants, mostly trees and shrubs. The leaves are undivided, sometimes minute.

The perianth is superior, 4—5-cleft. The stamens are 4 or 5, opposite the segments of the perianth, and inserted into their bases. The ovary is 1-celled, with 1—4 ovules. The fruit is 1-seeded, nut-like, or drupaceous.—There are about 110 known species, natives of various parts of the world, the European and most of the North American species being obscure weeds, whilst the trees of the order occur chiefly in the East Indies, New Holland, and the South Sea Islands. SANDAL-WOOD (q. v.) is the produce of plants of this order. The leaves of *Osyris N palensis* are used for tea. Some species are used in medicine in their native countries. *Fusanus acuminatus* is the Quandang Nut of New Holland. Its taste and qualities resemble those of Sweet Almonds, as do also those of the seed of the *Cervantesia tomentosa* of Peru. *Pyrularia oleifera*, the Buffalo Tree or Oil Nut, has a large seed, from which, in the Southern States of America, oil is obtained.

SA'NTALIN, or SANTALIC ACID, the coloring matter of *Pterocarpus santalinus*, or red sandal-wood, is readily obtained by digesting the rasped wood in alcohol, and then precipitating the santalin by the free addition of water. It is little used in this country as a dye-stuff, but it is employed in India both in dyeing silk and cotton. It is in consequence of the santalin contained in it that red sandal-wood is retained in the *Pharmacopœia* as a coloring agent for tinctures, &c.

SANTA MARGHERI'TA BELI'CÉ, a city of Sicily, in the province of Girgenti, with 7500 inhabitants. From the lands belonging to it, grain, wine, and oil are exported. Woven goods and hats are manufactured for export.

SANTA MARGHERITA DI RAPA'LLO, a pleasant town in the province of Genoa, situated on the sea-coast about 3 miles from Rapallo. The Genoese coral fishery is carried on principally by feluccas fitted out here, and manned by the bold seafaring population. Pop. (1871) of S. M. di R. (also called Santa Margherita Ligure), 4750.

SANTA MARI'A DI CA'PUA-VETERE, a city of Southern Italy, in the province of Caserta, with about 16,800 inhabitants. It is not handsome but new, and its population increases every year. The neighboring soil is very fertile, and produces abundance of grain, fruits, oil, and excellent wines. Its manufactures consist of cloth and other woven materials and hats.

SANTA MA'RTA, a town of the United States of Colombia, the capital of a province, on a bay of the Carribean Sea, 400 miles east-north-east from Panama. There is a good harbor, defended by a castle and several batteries. Pop. 8000.

SANTA MAU'RA, or LEUCA'DIA (anc. also *Leucadia* and *Leucas*, so called from its white cliffs), one of the Ionian Islands, off the west coast of the ancient Greek province of Acarnania, from which it is now separated by a passage about a mile wide, although it was in early times connected with the mainland by an isthmus. The canal across the isthmus, which converted the peninsula into an island, is said to have been cut by the Corinthians. S. M. is about 22 miles long, and has a breadth ranging from 6 to 9 miles. Area about 180 sq. m.; pop. 20,147. Its surface is very uneven. It is traversed by a range of hills from north to south, which end at the southern extremity in the high white cliffs called by the Italian sailors of the Levant Cape Ducato (a corruption of *Leucates*), but better known under the name of 'Sappho's Leap.'

SANTA'NDER, an important and thriving seaport of Spain, in the modern province of the same name, stands on a magnificent bay, an inlet of the Bay of Biscay, about equally distant from Oviedo on the west, and San Sebastian on the east. The bay on which the town is placed is from two to three miles wide, and about 4 miles long, and is accessible to the largest vessels at all times of the tide. The situation of the town, on a headland protected by a hill, is picturesque; among its edifices few are either interesting from their appearance, or important from their character. Of its former convents one now serves as a theater; another as a cigar-factory, giving employment to about 1000 people. Numerous new houses, and handsome warehouses, and commercial establishments of various kinds have been erected recently. The fine harbor of S., with a commodious entrance, is accessible at all tides, and unobstructed by a bar. Several important improvements have recently taken place here. The half of the province of S. may be said to be impregnated with iron, copper, zinc, and other ores; though, hitherto, the timidity of native capitalists has rendered the quantity extracted comparatively small.

In one year, 12,625 tons of iron and copper ores, together with a quantity of quicksilver and cobalt, were shipped from the port of S. to Great Britain alone, and mostly to Newport and Swansea. Wheat is an important element in the trade of Santander. The annual exports amount to about £1.500.000; and of that sum the exports of wheat and flour alone amount to the value of £1.400,-000. The imports—the chief articles of which are sugar from Cuba; textile fabrics from England, France, Belgium, and Germany; and salted cod-fish from Norway—amount to about £1,-800,000. A railway runs south from S. to Venta de Banos on the Great North of Spain Railway; and in the middle portion of it, from Barcena to Reynosa, a distance of 21 miles, there are 22 tunnels. Pop. 41,000. Area of province, 2111 square miles; pop. (1877) 235,299.

SANTARE'M, an interesting old town and river-port of Portugal, on the right bank of the Tagus, 46 miles north-east of Lisbon by railway. It carries on an active trade in the products of the fertile vicinity with Lisbon, with which there is steam-communication by river as well as by rail. Pop. about 8000.

SANTEE', a river of South Carolina, U.S., which rises in the Blue Ridge, in North Carolina, by two principal branches, the Congaree and Wateree, and flowing south-east, empties into the Atlantic Ocean. Lat. 33° 6'. It is navigable 150 miles to Camden, and is bordered, in its lower course, by rice-swamps and pitch-pine forests.

SANTERRE, ANTOINE JOSEPH, a French revolutionist, who for some time exercised an influence quite disproportioned to his feeble abilities, was born at Paris, 16th March 1752. He followed the trade of a brewer in the Faubourg Saint-Antoine, and his wealth, probity, and generosity towards his *employés* gave him an immense influence in the district. On the establishment of the National Guard in 1789, he received the command of a battalion, and took part in the storming of the Bastile. During the year 1792, the Jacobin agitators of the faubourgs often met in the brewery of S., and it was there that the *émeute* of the 20th June was preconcerted, on which occasion S., along with Saint-Huruge, marched at the head of the mob who invaded the Assemblée Nationale, and turned out the Girondists. He also played a conspicuous part on the 10th of August, when he was invested with the dignity of general-commanding of the National Guard. In October he was named Field-marshal (*Maréchal de Camp*), and in April 1793 he got the 'authorities' to let him off scot-free for a debt of some 50,000 livres, which he owed the exchequer in the shape of taxes on the beer manufactured by him—the minister of finance arguing that, inasmuch as S 's beer was drunk for the most part by 'patriots' (not always careful to pay their score), it ought not to be subjected to 'duty.' But greater things were yet in store for the privileged brewer. On the 30th of July, he was appointed a general of division in the French army, and wishing to do something to justify this strict military office, he marched at the head of 20,000 men against the Vendéan royalists, but was miserably beaten, and in consequence recalled. Shortly after, he was arrested and imprisoned, and only obtained his liberty after the death of Robespierre. He then withdrew into private life; but his fortunes and his popularity alike declined, and in 1800 we find him begging money and employment from Bonaparte. The latter, who saw clearly enough that S. was intrinsically an incapable fool, declined to employ him, but restored him to his military rank. S. died 6th February 1809.

Owing to the calumnies of royalist writers, S. commonly figures as one of the ferocious monsters of the Revolution. There is positively no evidence, however, for such an opinion. Though he was hugely fond of 'brave words,' and menaced his opponents with all the bellicose grandiloquence of a French revolutionist, he was nearly as soft in the heart as in the head. Some witty contemporary made the following epitaph on him:

> Ci-gît le général Santerre,
> Qui n'eut de Mars que la bière.

SANTIAGO, the largest of the Cape Verd Islands (q. v.).

SANTIA'GO DE CHI'LI, capital of the republic of Chili, and of a province of the same name, an archbishop's see, and the seat of the supreme government, stands at the western base of the Andes, 1800 feet above sea-level, and 90 miles east-south-east of Valparaiso. It was founded in 1541 by Pedro de Valdivia, but it has only recently acquired importance. Its climate is delightful; the plain on which it stands is extensive, and fertile in vines figs, melons, and other fruits, and the scenery, looking towards the range of the Andes, is of the grandest description. The valley or plain of S. is sprinkled with tasteful villas and well-cultivated farms. The city is arranged in squares, and the houses are generally low, and are built around a court or garden, which is intended as a place of refuge during the earthquakes that frequently occur here. But of late years it has become the fashion, in spite of the earthquakes, to build costly houses of two, three, and even four stories, with a façade towards the street. The Alameda, shaded with poplars, and cooled by two streams of running water, is a pleasant promenade. The Mint, a portion of which serves as one of the president's palaces, and as offices for the ministers, is the handsomest of the public buildings, many of which, however, are beautiful structures. The university comprises the five faculties of philosophy, mathematics and physical sciences, medicine, law, and theology.

There are important educational institutions (including a nor-

mal school), and a library and museum. On the west side of the great square, which is adorned with a fine fountain, is the cathedral. On December 8, 1863, one of its churches, that of La Compania, was destroyed by fire during service, and 2000 out of the 3000 of the congregation—the victims being mostly women—met a dreadful death. Gold, silver, and lead are exported, and the imports are chiefly manufactured goods, wines, and spirits. The chief trade is with Valparaiso by the Valparaiso and Santiago Railway, opened in 1863. Pop. (1875) 148,264. Area of province, 9000 sq. m.; pop. (1875) 362,712.

SANTIA'GO DE COMPOSTE'LLA, an important and once famous city of Spain, formerly the capital of Galicia, and, from the number of pilgrims by whom it was annually visited, the Mecca of Spain, is extremely picturesque in appearance, from its hill-girt situation on an irregular uneven site, 40 miles south of Coruña. The cathedral, occupying the site of a former edifice of the same nature, was founded in 1082, and its buildings, comprising a cloister, the archbishop's palace, &c., cover more than three and a half acres. The great square is a spacious area, and occasionally used as a bull arena. In front of the town-house is an equestrian statue of Sant Jago (St. James the Elder, the patron saint of the city and of Spain), whose body, according to a monkish legend, was discovered near this by a hermit—a star miraculously pointing out the spot, whence the name Compostella (*campus stellæ*, 'field of a star'). It was removed to Santiago in 829. The bones of the saint are believed by the people to be built into the foundations of the cathedral. A desolate appearance is imparted to the town from the number of tenantless and ruined nunneries and convents which it contains. Leather is manufactured, and the making and carving of small silver graven images employ a number of silversmiths. Pop. (1877) 24,192.

SANTIAGO DE CU'BA, formerly the capital of the island of Cuba, and now the chief town of the eastern department of the island, stands on a bay on the south coast at the mouth of a stream of the same name. It is hemmed in by mountains, and is reputed the most unhealthy place in the island. Its harbor is deep, well protected, and fortified. It communicates by railway and telegraph with the other towns of the island. As a seat of commerce, it takes rank after Havana and Matanzas. Pop. 45,000.

SA'NTONIN ($C_{30}H_{18}O_6$) is a vegetable principle possessing slightly acid properties, obtained from the seeds and flower-heads of several species of *Artemisia*. The British Pharmacopœia gives *Santonica*, 'the unexpanded flower-heads of an undetermined species of artemisia,' imported from Russia, as its source. It is one of the most efficacious of the class of medicines known as anthelmintics or vermifuges, the most obstinate cases of ascarides and lumbrici almost always yielding to its prolonged use. Pure santonin may be given in powder combined with scammony or rhubarb, the dose being from half a grain to two grains, according to the age of the child. The French prescribe it in the form of lozenges made with white sugar and mucilage; they are readily obtained in this country, and usually act satisfactorily. Küchenmeister, one of the highest authorities on the subject of intestinal worms, prefers the use of santonate of soda, which he obtains by digesting an alcoholic solution of santonin with carbonate of soda, evaporating and crystallizing. The dose is from two to eight grains mixed with sugar. Two very peculiar symptoms occur after the administration of santonin. The urine often acquires a reddish tint, which may give rise to an unfounded suspicion of the presence of blood in that fluid; and under its influence, vision becomes remarkably affected for a few hours, every object appearing either yellow or green to the patient. No satisfactory explanation of the latter phenomenon has yet been given.

SA'NTOS, one of the chief ports of the province of São Paulo (q. v.) in Brazil, 34 miles south-south-east of the city of São Paulo, of which it is the port. It stands on the northern side of the island of Engua Guaçu, and commands a fine bay. Sugar, coffee, and other products of the interior are transported to S. by troops of mules; and salt, flour, and other imported goods find their way back by the same means. It is stated that 200,000 mules arrive here laden during the year. 160,000 sacks of coffee are exported annually. Pop. stated at 8000.

SAN VICE'NTI. See SAN SALVADOR.

SAO FRANCI'SCO, a large river of Brazil, rises, as the Paraopeba, in the province of Minas Geraes, in lat. about 20° 40′ S.; long. 43° 25′ W. It flows north, north-east, and east, and in its lower course it separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas. Its first considerable affluent is the Rio das Velhas, which joins it from the right in lat. 17° 45′ S. Above the junction of the Velhas, at Pirapora, where the river is 1782 feet broad, and 1700 feet above sea-level, there is a fall of 17 feet. From the mouth of the Velhas (1666 feet above sea-level) to the falls of Paulo Affonzo, the river is navigable for 920 miles; and from these falls to the mouth of the river, a distance of about 140 miles, it is navigable for larger vessels and steamers. Its entire length is 1652 miles, and its breadth at its mouth is 3486 feet.

SAONE, a river of France, an affluent of the Rhone (q. v.), rises in the dep. of Vosges, at Vioménil, in the Faucelles Mountains, at the height of 1476 feet above sea-level, and flows south past Gray, Châlons, and Maçon to its confluence with the Rhone at Lyon. Entire length, 312 miles, of which 170 miles are navigable.

SAONE-ET-LOIRE, a dep. of France, bounded on the E. by the dep. of Jura and the river Saône, and on the W. by the dep. of Nievre and the river Loire. Area, 3300 sq. m.; pop. (1881) 625,589. The country consists for the most part of vast and fertile plains, separated by rich vine-clad hills. The fertility is greatest in the vicinity of the two main streams. Horses of a small but vigorous breed are reared; the excellent and abundant pasturage supports numerous herds. The wines, of which 15,400,000 gallons are made annually, are well known as *vins de Mâcon*. Agriculture, iron-mining, and manufactures of cotton fabrics, leather, pottery, fire-arms, &c., are all actively carried on. The dep. was formed in 1790 out of four districts of the ancient province of Burgundy—Maconnais, Charollais, Chalonnais, and L'Autunois. It now forms five arrondissements, of which Mâcon is the capital.

SAONE, HAUTE, a dep. in the north-east of France, bounded on the N. by the dep. of Vosges, and on the E. by that of Haut-Rhin. Area, 2050 sq. m.; pop. (1881) 295,905. About one-half of the entire area is in cultivable land, and more than a fourth part, comprising the north and north-east districts, is covered with forest-clad mountains. In the south and south-west, are fertile plains, bounded by hills, covered with vines or timber. The climate of this rich champaign district, with its bulwark of mountains against the north and north-east winds, is remarkably mild and healthy. Sheep, including some flocks of the merino breed, and cattle are reared in large numbers. Fruits are largely cultivated; and 6,600,000 gallons of wine and 220,000 gallons of brandy are made annually. The arrondissements are Gray, Lure, and Vesoul, and Vesoul is the capital.

SAO PAU'LO, a southern maritime province of Brazil, bounded on the N. by the province of Minas Geraes. Area, 169,050 sq. m.; pop. (1872) 837,354. Its coast-line—part of which in the north-east is high and rocky, though the rest is low—is about 400 miles in length. Sugar, coffee, rice, millet, and tobacco are staple crops; horses, cattle, and swine are reared for export; and among the minerals are the precious metals and gems. There are several commodious harbors, and the capital is São Paulo.

SAO PAULO, city of Brazil, capital of the province of the same name, stands on an uneven elevation between two small streams, tributaries of the Tiete, 220 miles west-south-west of Rio de Janeiro. There is an Academy of Laws, attended by about 500 legal students. The general appearance of the town is picturesque, and the vicinity and suburbs are beautiful. Pop. stated at 22,032.

SAO PEDRO DO RIO GRANDE. See RIO GRANDE DO SUL.

SAP, the fluid which circulates in plants, and is as indispensable to vegetable life, as the blood to animal life. Entering by the roots of the plant (see ENDOSMOSE), it ascends through the cells and vessels of the stem, proceeding to the surface of the leaves and utmost extremities of the system, and having been exposed, chiefly in the leaves, to the influences of air and light, returns through the bark, a portion ultimately reaching the root and being excreted there, whilst another portion probably enters again into circulation with the new fluid entering from the soil. See CIRCULATION OF SAP. Sap in its most simple state, the ascending or crude sap, consists chiefly of water, mucilage, and sugar; the elaborated sap varies much more in its properties in different plants, forming the peculiar juices of the plants. The elaborated sap always contains much less water than the ascending sap.

Plants seem to derive their supply of sap not only from the soil by their roots, but also from the atmosphere by the Stomata (q. v.) of their bark and leaves; and some, especially succulent plants, are capable of existing and increasing in size although entirely severed from the soil. The ascending sap appears to find its way through the whole wood of the stem in ligneous plants, but chiefly through the alburnum or sap-wood. The elaborated sap has been named LATEX (q. v.).—The ascent of the sap is one of the most wonderful phenomena of spring, and seems to depend not so much on the state of the weather, for it begins in the depth of winter, as on the plant having had its sufficient period of repose, and being therefore constrained by its very nature to renewed activity.

SAP, in Military Engineering, is a narrow ditch or trench, by which approach is made from the foremost parallel towards the glacis or covert-way of a besieged place. The sap is usually made by four sappers, the leading man of whom rolls a large

gabion before him, and excavates as he progresses, filling smaller gabions with the earth dug out, and erecting them on one or both sides to form a parapet. The other sappers widen and deepen the sap, throwing more earth on to the parapet. A sap is considered to advance in average ground about eight feet per hour. From the nearness of the enemy's works, running a sap is an extremely dangerous operation. When possible, therefore, it is carried on at night; in any case the sappers are relieved at least every hour. When a sap is enlarged to the dimensions of a trench, it bears that name.

SA'PAJOU, a name sometimes applied to all that division of American monkeys which have a prehensile tail, and sometimes limited to those of them which are of a slender form, as the genera *Ateles* (q. v.), *Cebus* (q. v.), &c.

SAPINDA'CEÆ, a natural order of exogenous plants, consisting of trees and twining shrubs furnished with tendrils, and a few herbaceous climbers. Their leaves are often marked with lines of pellucid dots. The flowers are in racemes or racemose panicles, hermaphrodite or unisexual. The calyx is 4—5-partite, or consists of 4—5 sepals. The petals are 4—5, occasionally wanting, hypogynous, usually having an appendage in the inside. The stamens are usually 8—10; often inserted into the disc, which is fleshy, and sometimes glandular. The ovary is generally 3-celled, the cells containing one or few ovules. The fruit is fleshy, or *samaroid*, or capsular. The order contains about 380 known species, natives of warm climates, especially of South America and India; none of them natives of Europe, although the HORSE-CHESTNUT (q. v.) is now as well known in many parts of it as most of its native trees.—The timber of some species is valuable, particularly that of *Pteroxylon utile* and *Hippobroma alatum*, natives of the Cape of Good Hope, the former known there by the name of *Nieshout*, and the latter of *Pardepis*. Some are used in medicine as astringents. Narcotic and poisonous properties are very generally developed—also a saponaceous principle, especially in the genus *Sapindus* (see SOAP BERRY). Yet GUARANA BREAD (q. v.) is made from the seeds of a species of this order; the leaves of another (*Cardiospermum halicacabum*) are used as a boiled vegetable in the Moluccas; and the fruits of some species are excellent.

SAPODI'LLA PLUM, the name given in the West Indies to the fruit of *Achras Sapota* and other species of *Achras*, a genus of the natural order *Sapotaceæ*. The seeds are aperient and diuretic, but an overdose is dangerous. The pulp of the fruit is subacid and sweet, and it is much esteemed for the dessert in the West Indies. The fruit of *Achras mammosa* is called MARMALADE. The NASEBERRY, also of the West Indies, belongs to this genus.

SAPONIFICA'TION. See OILS AND FATS, and SOAP-MAKING.

SA'PONIN ($C_{24}H_{20}O_{14}$) is a vegetable principle contained in various plants, including the *Saponaria officinalis*, or Soap-wort, the *Polygala Senega*, several varieties of *Lychnis*, the fruit of the horse-chesnut, &c. It is readily extracted from the root of soap-wort by means of boiling alcohol, which, as it cools, deposits the saponin as an amorphous sediment. It derives its name from its behavior with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken, like a solution of soap, if even $\frac{1}{1000}$th part of saponin be present. Its solution, or an infusion of soap-wort, is sometimes employed in place of a solution of an alkaline soap, for cleansing the finer varieties of wool from grease.

SAPOTA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, often abounding in milky juice. The leaves are leathery, entire, and without stipules. The flowers are axillary; the calyx regular persistent, generally with five divisions; the corolla monopetalous, hypogynous, deciduous, regular, its segments usually equal in number to those of the calyx, rarely twice or thrice as many. The stamens are inserted on the corolla, fertile ones generally as many as the segments of the calyx, and generally with alternate sterile ones. There is no disc. The ovary is superior, with several cells, each cell with one ovule. The fruit is fleshy; the seeds nut-like, sometimes cohering; the *testa* bony and shining, with a very long, opaque, and softer scar on the inner face.—There are considerably more than two hundred known species, chiefly natives of the tropics, and the remainder of sub-tropical countries. One of the most recently discovered species is also already one of the most important, *Isonandra gutta*, which produces GUTTA PERCHA (q. v.).—The fruits of some are pleasant, as the SAPODILLA (q. v.), and other species of the genus *Achras*, the STAR APPLE, and other species of *Chrysophyllum* (q. v.), different species of *Mimusops; Imbricaria Malabarica* and *I. maxima*, various species of *Lucuma*, &c. The genus BASSIA (q. v.) contains species valuable for the oils which they yield. The seeds of *Mimusops elengi* also yield oil abundantly.

SAPPAN WOOD, SAPAN WOOD, or BUKKUM WOOD, the wood of *Cæsalpinia Sappan* (see CÆSALPINIA), an East Indian tree, about forty feet high, with twice pinnate leaves, and racemes of yellow flowers. The wood is much used as a dye-wood, yielding a good red color, which, however, is not easily fixed. It is a very considerable article of export from Singapore and other ports of that region both to Calcutta and to Europe.

SAPPER, the name given to a private soldier in the corps of Royal Engineers.—The name of the corps was formerly Royal Sappers and Miners.—The pay of a sapper is £20, 10*s*. 7½*d*. a year, with extra pay when at work; the number of such men for 1877–78 was 2952. Only men of good character, already adepts in a mechanical trade, are eligible for this service, which is very popular, as an intelligent sapper frequently passes into some situation in civil life for which his practical military training specially fits him. Many sappers are excellent surveyors, photographers, and draughtsmen.

SA'PPHIRE, a gem excelled in value by no precious stone except diamond, and regarded as a variety of Corundum (q. v.), highly transparent and brilliant. It is sometimes colorless, and the colorless kind, called *White S.*, is sometimes sold as diamond. It more frequently exhibits exquiste color, generally a bright red or a beautiful blue; more rarely, gray, white, or green. The red variety is the Oriental Ruby (q. v.) of lapidaries; the blue is that commonly called S., and which has received this name from ancient times. It is found crystallized, usually in six-sided prisms, terminated by six-sided pyramids; and is sometimes found imbedded in gneiss; but it more frequently occurs in alluvial soils. It occurs at Bilin in Bohemia, and Expailly in Auvergne, but more abundantly in some parts of the East.

Ceylon is famous both for its rubies and its sapphires, the latter being the more abundant. They occur with garnets and other minerals, in a stratum of water-worn pebbles firmly imbedded in clay, in which there are occasional lumps of granite and gneiss. But nothing has yet been done to seek for them in their original situation in the mountain rocks. A piece of S., which was dug out of the alluvium within a few miles of Ratnapoora in 1853, was valued at upwards of £4000. The S. was one of the stones in the breastplate, of the Jewish high-priest. Among the Greeks, it was sacred to Jupiter.—The name *Girasol S.* is given to a beautiful variety with a pinkish or bluish opalescence, and a peculiar play of light. The *Chatoyant S.* has more pearly reflections. The *Asteria S.* has in the midst of it a star of six bright rays, resulting from its crystalline structure.

SA'PPHO, along with Alcæus, the chief representative of the Æolian school of lyric poetry, was born either at Mitylene or at Eresos in Lesbos. She was only six years old when she lost her father Scamandronymus. She was contemporary with Alcæus, Stesichorus, and Pittacus, with the first of whom she lived in friendly intercourse, as is seen in the surviving lyrics of both. All that we know of her is contained in an obscure reference in the Parian Marble, and in one of the epistles of Ovid, to her having fled from Mitylene to some place of refuge in Sicily, between 604 and 592. Her famous plunge into the sea from the Leucadian rock, on finding her love for Phaon unrequited, seems to be an invention of later times. At Mitylene, she is supposed to have been the center of a literary coterie, all of them females, and most of them pupils of her own in the art of poetry. Her moral character has been the subject of controversy in modern times; the most recent disputants being the late Colonel Mure and the well-known F. G. Welcker of Bonn, who, in the *Rheinisches Museum* (1857—1858), appeared, the former, for the prosecution, and the latter for the defence.

To whatever opinion on this subject we may incline, there is no doubt of her high lyrical genius, which was the admiration of antiquity from Solon downwards, and which, as still surviving in her matchless ode to Aphrodite, enhances our regret that of the nine books of her poems, we only possess fragments. The best text is that contained in Bergk's *Poetæ Lyrici Græci* (1854); the best separate edition is Neue's (1827).

SAPUCAIA NUT, the seed of *Lecythis ollaria*, a lofty tree, which is plentiful in the forests of the north of Brazil, and belongs to the natural order *Lecythidaceæ*. The fruit is urn-shaped, as large as a child's head, and opens by a lid which falls off. Each fruit contains a number of seeds or nuts, as in the case of the allied Brazil nut. The flavor is finer than that of the Brazil nut, although, hitherto, the S. N. is much less common in our shops. Its form is oval, somewhat pointed at both ends, which are slightly bent in opposite directions. Monkeys are very fond of the S. N., and are sometimes caught in consequence of thrusting the hand into a capsule, and not being able to withdraw it when filled with a nut, whilst they obstinately keep hold of the expected prize.

SA'RABANDE, originally a slow dance, said to be of Saracenic origin; and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in ¾ time, the accent being placed on

the second crotchet of each measure. The sarabande is of frequent occurrence among the *suites* or series of short pieces written by Handel, Sebastian Bach, and others of the old masters, for the harpsichord or clavichord.

SARACE'NIC ARCHITECTURE. See ARABIAN ARCHITECTURE.

SA'RACENS, a name variously employed by medieval writers to designate the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of Northern Africa, who conquered Spain and Sicily, and invaded France. At a later date, it was employed as a synonym for all infidel nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, and even to the pagan Prussians. The true derivation of the word was long a puzzle to philologers; Du Cange deduced it from Sarah, the wife of Abraham, an opinion coincided in by the medieval Christian authors; Hottinger (*Biblio. Orient.*), from the Arab. *saraca*, to steal; Forster (*Journey*), from *sahra*, a desert; while others strove to see its origin in the Hebrew *sarak*, poor; but the opinion which has been most generally supported, and prevails at the present time, is that the word was originally *Sharkeyn** (Arab. 'eastern people'), corrupted by the Greeks into *Sarakenoi*, from which the Romans derived their word *Saraceni*. The epithet Sarakenoi was applied by the Greek writers (from the 1st c. of the Christian era) to some tribes of Bedouin Arabs in Eastern Arabia, though they do not agree among themselves as to the particular tribe so denominated. Pliny and Ammianus place the S. in Arabia Petræa and Mesopotamia, on the common frontier of the Roman and Persian empires; and the description of them by the latter, a most painstaking and accurate historian, coincides, in every important particular, with what is known at the present day of the Bedouin tribes of those regions.

SARACEN'S HEAD, a not unfrequent bearing in Heraldry. It is represented as the head of an old man, with a savage countenance.

SARAGO'SSA, or ZARAGOZA, a city of Spain, the capital of a province of the same name, and formerly of the kingdom of Aragon. It stands on the Ebro, here a muddy stream, which divides the city into two parts, and is crossed by a noble stone bridge, built in 1437. The city has an imposing appearance from a distance, being adorned with numerous slender towers and spires; but the traveler, on entering it, finds it full of narrow winding lanes, instead of streets, although the houses—which are built of brick—are of most solid structure, and many of them are the palaces of a nobility who have now ceased to reside here. These buildings, rich in finely carved decorations and magnificent cornices, are now mostly inhabited by agriculturists of a rude class; their spacious courts converted into farm-yards, and filled with dung-heaps. Everything about the city indicates decay and poverty. S. was the Celtiberian *Salduba*, but received the new name of *Cæsarea Augusta* in 25 B.C., of which the present name is a corruption. It was a place of importance under the Romans, but there are few remains of the Roman city. S. was one of the first cities of Spain in which Paganism was generally renounced and Christianity adopted; it afterwards became rich in relics, to which miraculous powers were ascribed. S. was taken by the Moors in the 8th c., and recovered from them in 1118, after a siege of five years, during which great part of the inhabitants died of hunger. It was taken by the French in 1809, after a siege of eight months, and one of the most heroic defences recorded in the history of modern warfare. See PALAFOX.

S. has a university, founded in 1474. It has two cathedrals, both interesting as specimens of architecture; but the older is in a simple and severe style; the modern one—that of *Nuestra Senora del Pilar*—is very ornate. The latter cathedral boasts of a pillar on which the Virgin descended from heaven, 40 A.D.—an event so strongly attested, that Diego de Astorga, primate of Spain, on 17th August 1720, excommunicated all who even questioned it. Pilgrims flock from all neighboring parts of Spain to this pillar and the image of the Virgin, which came down from heaven. S. suffered grievously at the hands of the French in 1809, and lost most of its treasures of art. It has a considerable trade in agricultural produce, mostly carried on by the Ebro; and manufactures of silks, woollens, and leather. Pop. (1877) 84,577.

SARA'NSK, a town of European Russia, in the province of Penza, and 80 miles north from Penza, at the confluence of the Saranga and Insara, feeders of the Sura. Pop. (1880) 13,438.

SARASWATI is, in Hindu Mythology, the name of the wife, or the female energy, of the god Brahman, the first of the Hindu Trimûrti or triad. She is also the goddess of speech and eloquence, the patroness of music and the arts, and the inventress of the Sanscrit language and the Devanâgarî letters. She was induced to bestow these benefits on the human race by the sage *Bharata*, who, through his penance, caused her to descend from heaven, and to divulge her inventions. Hence she is also called *Bharati*. She was very white, hence another of her names, *Mahas'weta*, or *Mahas'ukla* (from *mahat*, great, and *s'weta* or *s'ukla*, white).—S. is also the classical name of the river now called *Sarsooty*, which rises in the mountains bounding the north-east part of Delhi, whence it runs in a south-westerly direction, and is lost in the sands of the great desert in the country of the Bhatti. According to the Hindus, the river only disappears in this place, and continuing its course underground, joins the Ganges and Jumna at Allahabad.

SARATO'GA SPRINGS, one of the chief watering-places in the U.S., is in New York, 32 miles north of Albany. It contains 28 mineral springs, some chalybeate; some containing iodine, with salts of soda and magnesia; and all highly charged with carbonic acid. They are prescribed in diseases of the liver, chronic dyspepsia, &c. In the village are 32 hotels, some of immense magnitude; and during each season there are from 30,000 to 45,000 visitors. Pop. (1870) 7516; (1880) 10,822. A few miles to the east, near Saratoga Heights, an engagement took place on Sept. 14, 1777, between the British under Burgoyne and the Americans under Gates, the British being worsted; and on Oct. 17 the British general surrendered with an army of 5800 men.

SARATO'V, a government in the south-east of Russia, is bounded on the E. by the river Volga. Area, 32,500 sq. m.; pop. (1880) 1,988,350. In 1850 the territory *east* of the Volga, formerly part of S., was erected into the government of Samara (q. v.). Nearly half the area of S. is as yet waste land. A number of German colonists settled here in 1765—1775, and distinguished themselves by their persevering industry and by diligent cultivation of the soil. Their descendants have become an important section of the population. Cattle-breeding is carried on extensively; fishing is of considerable importance.

SARATOV, a city of Russia, capital of the government of the same name, on the right bank of the Volga, 460 miles south-east of Moscow. Though its houses are generally built of timber, the town has a rich and picturesque appearance. Its 16 churches are ornamented with numerous towers and cupolas; and its broad streets, from the character of the houses and of the elegant equipages that roll through them, have quite a European appearance. It manufactures pottery, bricks, tobacco, silk, hosiery, &c. Pop. (1880) 86,420.

SARA'WAK, a kingdom on the north-west coast of Borneo, is bounded S. and W. by Sambas, E. by Brunai, and N. by the Bight of Datu. The coast stretches from the west of Cape Datu, in lat. 2° N., and long. 109° 55′ E., to the east of the river Samerahan, in long. 111° 3′ E., a distance of nearly 70 miles. Area, 25,000 sq. m. Pop. 240,000. The Sarawak is the most important river; it has two navigable mouths, the one entering the Bight of Datu in lat. 1° 42′ 30″ N., and long. 110° 20′ 30″ E.; the other, a few miles further to the east. Other considerable rivers are the Rejang (navigable for 120 miles for vessels of more than 1000 tons), the Lûndu, Samerahan, and Sadang. A chain of mountains, 3000 feet in height, rises in S., and, with increasing elevation, tends towards the north; while others are detached, as the Samerahans, and the steep, densely-wooded Lûndu. Sandstone and granite are the prevailing rocks; porphyries, basalt, and quartzose schists also occurring. In some parts, the soil is clayey; in others, it is a rich mould. With the exception of some cultivated spots, the surface is covered with forests, which abound with wild swine, harts, and a variety of monkeys. There is excellent coal near the river Sadang. Antimony ore, which can be both easily worked and shipped, is obtainable in any quantity, copper and gold have been found, and iron ore is plentiful at Lûndu. Fine timber trees, as ironwood, ebony, sandal-wood, teak, and other sorts peculiarly adapted for shipbuilding, grow on the lands near the mouths of the rivers. Overtopping them all is the tall Camphor Tree (*Dryobalanops aromatica*), from which by incision, the valuable camphor-oil is obtained; or by felling and splitting the wood, the crystallized camphor, which is prized above that produced in any other part of Asia.

The climate is not considered unhealthy. Much rain falls from September to March, and the thermometer usually indicates about 83° F. Edible nests, wax, and aromatic woods are collected by the Dyaks for the Singapore market, and the plains are well adapted for the growth of rice and sago. In 1862, two cargoes of choice timber for ship-building were sent to the royal dockyards of Great Britain, and more attention is now being paid to that natural source of wealth. The chief exports are gutta-percha, sago flour, antimony ore, and edible birds' nests, and have a value of near £300,000 annually; and the imports, chiefly cloth, tobacco, brass-ware, opium, rice, and cocoa-nut oil, have about the same annual value. The exportation of antimony and sale of opium are monopolized by the government, and with a small head-tax, form the chief revenue.

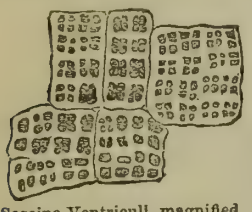
The original inhabitants are Dyaks, divided into some 20 tribes,

* *Sharkeyn*, or *Sharakyoun*, 'eastern people,' is thus opposed to *Magharibé* or *Maghribé*, 'western people,' the self-styled appellation of the inhabitants of *Maghrib* ('the west') or *Morocco*.

and speaking different dialects; they are, for savages, mild, industrious, and honest. Malays live on the coast, and the mines are worked by Chinese. From 1841 to 1868, S. was governed by Sir James Brooke (q. v.), as an independent rajah. Sir James was succeeded by his son. The rajah is an absolute sovereign, but has a legislative council of natives and Europeans. Even on the testimony of the Dutch, who view with jealousy the increased influence of the British on that coast, the new rule has done much to suppress piracy and promote the civilization and prosperity of the people.

The seat of government is the town of Sarawak, formerly called Kūtjing, about 18 miles from the mouth of the river, which is navigable for large ships. Mission-stations and schools have been erected, and the population has increased to 12,000. Trade, which is authoritatively reported to have increased about 600 per cent. since 1854, is principally carried on with Singapore.

SA'RCINA (Lat. a package), or SARCI'NULA, a genus of minute plants of very low organization, sometimes reckoned among *Algæ*, and sometimes among *Fungi*. A number of forms or species are known. The first discovered, called *S. ventriculi*, was originally observed by Goodsir in matters vomited from the human stomach. It is of a roundish quadrangular form, about $\frac{1}{100}$th to $\frac{1}{150}$th of a line in diameter; the individuals generally grouped in cubes of four, sixteen, or sixty-four in the cube, separated by rectangular striæ. Although the most common seat of sarcinæ is the human stomach, they have likewise been detected in the stomach of the tortoise, the rabbit, the dog, the ape, and in the cæcum of the fowl; in the urine, in a considerable number of cases; in the lungs; in the fæces and intestinal canal; in the fluid of the ventricles of the brain; in cholera stools; in the fluid of hydrocele; in the bones; and Dr. Lowe has noticed its existence in stagnant water. It appears from the measurements of Welcher that the sarcinæ occurring in urine are about half the size of those occurring in the stomach, and the aggregations of sarcina cells are also smaller.



Sarcina Ventriculi, magnified 1000 diameters. (Copied from the *Micrographic Dictionary*. Lond., Van Voorst.)

The occurrence of the sarcina in the urine, the fluid of the ventricles of the brain, &c., is probably a *post-mortem* phenomenon of little diagnostic or pathological importance. Its appearance in vomited fluids is, however, characteristic of a peculiar and important form of dyspepsia. The vomited matter in these cases has a faint acid smell, like that of fermenting wort, and is obviously in a state of fermentation. After standing a few hours, it becomes covered with a thick, brownish, yeast-like froth, and deposits a brown flaky sediment. On examining the froth and the deposit under the microscope, sarcinæ are found in great abundance, together with the torulæ characteristic of Yeast (q. v.). The fluid is always acid, if sarcinæ are present. The amount of vomited matter is always large, and sometimes enormous. It is usually ejected in the morning, after a night spent awake from a sense of heat, gurgling, and distention in the epigastric region; and its discharge gives almost immediate relief. Dr. Budd, one of the highest authorities in diseases of the stomach, believes that the disease consists, primarily and essentially, in some organic change, which prevents that organ from completely emptying itself, and which causes a secretion from its coats, capable, when mixed with food, of undergoing or exciting a process of fermentation; and that the development of the sarcinæ bears to this process, or to some stage of it, the same relation which the development of torulæ bears to simple alcoholic fermentation. The well-known power of sulphurous acid in checking the fermentative process, induced Professor Jenner to try the effect of sulphite of soda—a salt which readily yields its sulphurous acid—in this disease; and experience has fully confirmed the accuracy of Jenner's induction; for this salt, administered soon after a meal, or when the fermenting process is commencing, in doses varying from 10 grains to a drachm, dissolved in water, is the most effectual remedy at present known for relieving this disorder. The hyposulphite of soda, in somewhat larger doses, has a similar action.

SA'RCINE (Gr. *sarx*, gen. *sarcos*, flesh) is the name now given to a nitrogenous substance ($C_{10}H_4N_4O_2$) which has been obtained from the muscular tissue of the horse, ox, and hare; and from various glandular organs, as the liver and the spleen of the ox, the thymus gland of the calf, and the human liver, in cases of acute atrophy of that organ, in which case it is associated with xanthine ($C_{10}H_4N_4O_4$), a substance differing from it only by two atoms of oxygen. It is identical with the substance formerly known as Hypoxanthine.

SARCOLE'MMA is the term applied to the delicate sheath which invests each primary muscular fibre. See MUSCLE.

SARCO'MA is a somewhat vague term used by Abernethy and many subsequent surgical writers to designate a fleshy or firm morbid tumor. The term sarcoma is comparatively rarely met with in recent works on surgery.

SARCO'PHAGI. See CANNIBALISM.

SARCO'PHAGUS (Gr. flesh-eater), any stone receptacle for a dead body. The name originated in the property assigned to a species of stone found at Assos in Troas and used in early times, of consuming the whole body, with the exception of the teeth, within the space of forty days. The oldest known Sarcophagi are those of Egypt, some of which are contemporary with the pyramids. The earliest of these are of a square or oblong form, and either plain, or ornamented with lotus leaves; the later are of the form of swathed mummies, and bear inscriptions. The Phœnician and Persian kings were also buried in sarcophagi. The Roman sarcophagi of the earlier republican period were plain. Sarcophagi were occasionally used in the later republic, although burning had become the more general mode of disposing of the dead. The use of stone chests for the interment of distinguished persons has not been altogether discontinued in modern times.

SARDANAPA'LUS. See ASSYRIA.

SARDE, or SARDA, a variety of quartz, differing from carnelian only in its very deep red color, blood-red by transmitted light. It is rare, and brings a much higher price than common carnelian. The name is probably from Sardis. The S. was one of the stones of the breastplate of the Jewish high-priest. There were also two in the ephod. The SARDONYX is an Onyx (q. v.) containing layers of sarde.

SA'RDÉS, OR SARDIS, anciently a city of Asia Minor, the capital of Lydia, was situated in a fertile plain, between the northern base of Mount Tmolus and the river Hermus, about 60 miles east-north-east of Smyrna. Through its *agora*, or market-place, flowed the Pactolus, a tributary of the Hermus. The city is first mentioned by Æschylus. It was taken by the Cimmerians in the reign of King Ardys (680—631 B.C.). In the reign of Crœsus, the last Lydian king, S. attained its highest prosperity. It became the residence of the Persian satraps after the overthrow of the Lydian monarchy. The Athenians burned it 503 B.C., and it afterwards passed under the Romans, and was the seat of a separate provincial government. It is one of the Seven Churches mentioned in the Book of Revelation.—*Sart*, the modern Sardis, is a poor village, worthy of mention only for the ruins of the ancient city to be seen in the vicinity. Of these, the chief are those of a stadium, of a theater, and of the Acropolis.

SA'RDINE (*Clupea Sardina*), a fish of the same genus with the herring and pilchard, smaller than the pilchard; abundant in the Mediterranean, and found also in the Atlantic Ocean, although not so far north as the British shores. It is much esteemed for its flavor, and sardines preserved in oil are exported in large quantities from some of the Mediterranean ports. But the 'sardines' of the west coast of France, which are largely imported into Britain, are generally not true sardines, but young sprats—the *garvies* of the Firth of Forth—and sometimes young herring.

Sardines appear in shoals on the coasts of the Mediterranean at particular seasons, as herrings and pilchards on those of Britain. The S. fishery on the coast of Provence is chiefly in the months of May, June, and July; but the fishery for sprats, which are cured as sardines, and sold under that name in the west of France, takes place in the winter months. About the year 1880, sardines disappeared from the coasts of Brittany, where they were estimated to be worth 15,000,000 francs per annum (£600,000) to the fishermen. They are exported to the most distant parts of the world; cured with oil in tin boxes, forming a much esteemed delicacy, and, at the same time, a most wholesome article of food. To cure them in this way, they are first carefully washed in the sea, then sprinkled with fine salt; and after a few hours, the head, gills, &. are removed; they are then washed again, and spread out on willow branches or wire-work, exposed to the sun and wind, if the weather is dry, but in damp and rainy weather, to a current of air under cover. They are next put into boiling oil, in which they remain for a short time, and when they are taken out, the oil is drained away from them as much as possible, and they are put into the tin boxes, of which the shape and appearance are so familiar to everyone. The boxes being filled with sardines, are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling-water, or exposed to hot steam. The boxes which have leaked or have burst in boiling are rejected, and those which remain sound are now ready for the market.

In the south of France, sardines are sometimes cured in red wine, and those so cured are called *Sardines Anchoisées*, or Anchovied Sardines.

In 1875 the 'Cornish Sardine Company' was formed at Falmouth for the purpose of preserving pilchards in oil after the

manner above described. The result is a delicacy hardly to be distinguished from French sardines. The company is thriving; and thus, it is to be hoped, tons of hitherto waste food will be utilized.

Several species of small *Clupeidæ*, much resembling the S., are found in different parts of the world, and are used in the same way as the S. of the Mediterranean. One species frequents the southern and eastern coast of Ceylon in such vast shoals, that 400,000 have been taken at a single haul of the nets in a little bay; and when the shoal approached the shore, the broken water became as smooth as if a sheet of ice had been floating below the surface.

SARDI'NIA, KINGDOM OF, a former kingdom of Italy, and the nucleus of the present *Kingdom of Italy*, included the duchies of Savoy and Genoa, and parts of those of Montferrat and Milan, the principality of Piedmont, the county of Nice, and the islands of Sardinia and Caprera, amounting in all to 19,564 English sq. m. of continental territory, with a pop. of (1857) 4,590,260, and 9205 of insular territory, with a pop. of 577,282; total area 28,769 English sq. m., pop. 5,167,542. In 1859, it was increased by the addition of the Austrian portion of the Milanese, and diminished by the cession in 1860 of Savoy and Nice to France, the change in the continental territory being shown by the following figures: area, 21,099 English sq. m.; population, 6,530,232; the insular territory remaining unaltered. The various districts above mentioned differ greatly from each other in physical configuration and climate, and the more important of these are treated in separate articles. See also ITALY. The Roman Catholic religion was established by law in March 1848; but monastic orders, with the exception of those which are also benevolent institutions, were suppressed May 28, 1855. In 1859, the army amounted to 76,172 men, and the fleet to 29 ships (none of them men-of-war), with 436 guns; the revenue (1858), which was mostly derived from customs, duties, and direct taxation, to £5,799,301; and the expenditure to £5,949,902—a want of equilibrium in the finances which had long existed, and which caused the establishment, since 1819, of a gradually increasing national debt, that amounted (1858) to £27,080,810. The annual import trade amounted (1857) to a declared value of £19,123,054, and the exports to £14,605,043.

The kingdom of S. was originated by a treaty (24th August 1720) between Austria and the Duke of Savoy (q. v.), by which the latter agreed to surrender Sicily to the former on condition of receiving in exchange the island of Sardinia, and the erection of his states into a kingdom. In 1730, *Victor-Amadeus I.*, the last Duke of Savoy and first king of S., resigned the throne to his son, *Charles Emmanuel I.* (1730—1773); but repenting his resolution, and attempting to resume the government, he was put in prison, where he died in 1732. His son, by joining with France and Spain against Austria, obtained (1735) the territories of Tortona and Novarra, to which were further added (1743), during the war of the Austrian Succession, the county of Anghiera, and the territories of Vigevano and Pavia, He was the author of the code known as the *Corpus Carolinum*. His successor, *Victor-AmadeusII.* (1773—1796), acceded to the European coalition against France, and was deprived in consequence of Savoy and Nice in 1792; but sustained by England and the pope, he raised an army, and maintained himself in his kingdom till 1796, when Bonaparte forced him formally to relinquish the territories he had lost. His son, *Charles Emmanuel II.* (1796—1802), was at first an ally of France; but the Directory, in 1798, compelled him to surrender all his continental possessions, which were then incorporated with France; and it was not till the first peace of Paris (May 30, 1814) that the House of Savoy regained its territories. The Congress of Vienna (December 1814) annexed to S. the ancient republic of Genoa, and the second peace of Paris (1815) restored a small portion of Savoy, which France still possessed, and gave the king a protectorate over the small principality of Monaco. Long before this time, Charles-Emmanuel had abdicated, and his brother *Victor-Emmanuel I.* (1802—1821), succeeded to his rights, and made his entry into Turin, 20th May 1814. His return restored the ancient misgovernment; and similar political changes in the other Italian states revived the societies of the 'Carbonari' (q. v.) and other similar secret associations, whose aims were supported by a portion of the nobility and army, and by the heir-presumptive to throne, Charles-Albert, Prince of Savoy-Carignan.

The insurrection of the army on the 9th and 10th of March 1821, brought on a general revolution. But the king having abdicated in favor of his brother, *Charles-Felix* (1821—1831), and the Austrians having come to the rescue, the insurrection was put down. Under the protection of an Austrian army of occupation till 1828, Carles-Felix re-established absolute power, recalled the Jesuits, persecuted the Protestants, and took various other measures for rooting out all opposition. On his death, the elder line of Savoy became extinct, and the succession fell to the cadet branch of Savoy-Carignan (see SAVOY, HOUSE OF), whose rights had been recognized by the Congress of Vienna, and *Charles-Albert* (q. v.) (1831—1849) ascended the throne. The liberals were gratified with some slight reforms, but the power of the clergy was untouched, and the conspiracy of 30th November 1833 at Turin, and the mad inroad of Mazzini, at the head of a small band of German, Polish, and Italian refugees, in February 1834, only disturbed the country, and confirmed the government in its despotic policy. The interior administration was, however, carried on with more energy than under the two previous reigns, through the conclusion of treaties with France, Britain, Turkey, the Low Countries, Denmark, Austria, and the Hanse Towns, &c; the construction of roads, bridges, and railways was vigorously prosecuted, and agriculture and other industries were encouraged. In 1842, the king commenced a gradual but progressive liberal policy, promulgated a limited act of amnesty to political offenders, relaxed the severity of censorship, reformed judicial administration and prison discipline, and abolished the feudal system in Sardinia. The kingdom participated in the agitations of 1846 and 1847, which affected the whole peninsula, but was wholly exempt from insurrections and conspiracies, the people contenting themselves with expressing their views and wishes in petitions and demonstrations displaying entire confidence in the government.

On February 8, 1848, the king announced a new and extremely liberal constitution, which was proclaimed some weeks afterwards; a liberal law of election was decreed, the first Sardinian parliament convoked for the 17th April, and the act of amnesty declared general. In the midst of these changes, the revolution broke out, and Charles-Albert, who was saluted with the title of 'the sword of Italy,' put himself at the head of the movement, and declared war against Austria. (See ITALY, RADETSKY, &c.) On the day after the fatal rout of Novara (13th March 1849), Charles-Albert abdicated, and was succeeded by his son, Victor-Emanuel (q. v.), who, in alliance with France, declared war against Austria in 1859; and by March 1861 was in possession of the whole of Italy, except Venetia and Rome, and exchanged the title king of S. for that of king of Italy. Venetia was added to the kingdom in 1866, and the Papal States in 1870, when the union of Italy was complete.

SARDI'NIA, ISLAND OF, the largest, after Sicily, of the islands of the Mediterranean, lies directly south of Corsica, from which it is separated by the Strait of Bonifacio, a channel only 7 miles wide in its narrowest part. S. is situated about halfway between Central Italy and Africa, and between Southern Italy and Spain. Its length is 166 miles; greatest breadth 90 miles; and area 9361 sq. miles. The country is mostly mountainous, some of the peaks of the central chain having an elevation of 6300 feet. The Limbara range, in the northwest, is granite, the diagonal chain palæozoic, and the central range of the tertiary calcareous formation; many of the peaks, especially within the semicircle formed by the Limbara range, are extinct volcanoes. The coasts are generally steep and rugged. A few islands lie off the coast, and all, of any considerable size and importance, are situated at the corners; off the north-east corner are the Maddalena group, consisting of Maddalena, Caprera, and five or six minute islets; off the north-west corner is Asinara; and off the south-west corner are San Pietro and San Antioco. The island is well supplied with streams, but none of them have a long course, and only one is partially navigable.

Soil and Climate.—Between the mountain ranges are several wide valleys of remarkable beauty and fertility. There are also several large sandy or stony districts (*macchie*), of almost irremediable sterility. The mountain sides are partly rocky and barren, partly clad with woods, and partly fitted for pasture. The climate is mild, the temperature ranging from 34° to 90°; but in the low lands, which are largely of a marshy character, and in the neighborhood of the littoral lakes, a deadly malaria (*intemperie*) prevails, especially in autumn. The inhabitants of those districts, who can afford to do so, migrate annually during the unhealthy season; and those who are compelled to remain never leave their houses till an hour after sunrise, and carefully return before sunset, taking all precautions to prevent the entrance of the poisonous gas by door or window. The inhaling of the miasma by a stranger is considered among the inhabitants to be as deadly as a dose of strong poison.

Products.—Wheat, barley, maize, oranges, and other fruits are produced in abundance, and are esteemed for their excellent quality. The vine is extensively cultivated, but, from carelessness in the process, the wine is not so good as might naturally be expected. The olive-grounds are extensive, and the produce excellent. Tobacco (of inferior quality), cotton, linseed, flax, hemp, saffron, and madder are also produced. The woods which clothe the mountain sides are chiefly composed of cork, chestnut, oak, pine, and other timber trees, which form a considerable item in the export trade. Many mountain-slopes have, however, been much deteriorated in fertility by the excessive cutting down of timber.

The bullock is the favorite animal for draught, but horses are also used; and a small species of pony, which in ancient times was much esteemed by the Roman matrons, is still found. The sheep are of ordinary quality, and the swine are said to be among the best in Europe. Few cows are kept, and cheese is obtained almost wholly from sheep's and goat's milk. Wild boars and deer are not uncommon, and the Moufflon (q. v.) is found in the Alpine woods. Foxes, rabbits, hares, and martens are so abundant that a large export trade in their skins is carried on. The fisheries are important.

Manufactures are insignificant, being mostly the result of home industry; but the royal manufactories of gunpowder, salt, and tobacco are of considerable importance. S. is rich in minerals, but these, like its other resources, are as yet little developed; silver, mercury, granite, gypsum, marble, alabaster, amethyst, and other precious stones, are found; and lead, iron, and copper are in considerable abundance. Gold, bismuth, and antimony are said to exist.

Inhabitants.—The inhabitants bear a considerable resemblance to the Greeks, and speak a barbarous dialect, composed chiefly of Spanish, Arabic and Italian; they are ignorant and bigoted, having been subjected to misgovernment and oppression from their emancipation from Roman rule till 1836, when feudal tenure was abolished, and the enormous power of the clergy somewhat reduced. They are generally stupid and indolent, clothe themselves in sheep-skins, and invariably profess the Catholic religion. The custom of the *Vendetta* is frequently practised, though not to the same extent as in Corsica.

History.—S., at first called by the Greeks *Ichnusa* and *Sandaliotis* (from its resemblance to a human foot-print), and afterwards *Sardo* by the Romans, was colonized at a very early period. The first really historical event is its conquest, about 480 B.C., by the Carthaginians, who, during their occupation, rendered the island a celebrated corn-producing country. They were forced to abandon it to the Romans (238 B.C.), who gradually subdued the rebellious natives, and made it a province of the republic; but on three several occasions, formidable outbreaks required the presence of a consul with a large army to restore the authority of Rome. From this time it was held as a subject province, and on account of its value as the 'granary of Rome,' was carefully protected from invasion. It fell into the hands of the Vandals and other barbarians, and was recovered by the Eastern Empire in 534 A.D., but was finally separated from the Roman Empire by the Saracens. They were driven out in their turn by the Pisans, one of whose deputy-governors, being supported by the Genoese, obtained the erection of S. into a kingdom (1154) by Frederick I.

The popes, who had long claimed a right of suzerainty over the island, gave it, in 1296 to James II. of Aragon; and it continued in the possession of Spain till 1708, when it was taken possession of by the British, and by the peace of Utrecht (1713) it was yielded to Austria. In 1730, Austria gave it to the Duke of Savoy in exchange for Sicily, and it has since that time formed a part of the dominions of the House of Savoy. When S. came to the House of Savoy, two-thirds of it belonged to barons of Spanish descent, and the most of the remainder to the clergy, who also levied a tithe on the whole produce, and for a century afterwards, it was shamefully neglected by the government. However, in 1836 and 1837, patrimonial rights and compulsory labor were abolished; and in 1838 and 1847, the peasants were freed from the rest of the vexatious imposts with which they were burdened. In 1847, the vice-royalty was abolished, and S. incorporated with the Sardinian kingdom (q. v.). Pop. of island (1881) 682,012. It is divided into two provinces, Cagliari in the south (area, 5326 sq. m.; pop. 421,085), and Sassari in the north (area, 4125 sq. m.; pop. 260,927). Cagliari is the capital of the whole island.

SARDO'NIC SMILE is a term applied by the older medical writers to a convulsive affection of the muscles of the face, somewhat resembling laughter. It may occur in tetanus or lock-jaw, and other convulsive affections, or may result from the action of certain vegetable poisons. The name is from a ranunculus termed *Herba Sardonica*.

SARDOU, VICTORIEN, a prolific, brilliant, and successful French dramatist, born at Paris, 7th Sept. 1831. He studied medicine, and produced his first comedy in 1854. This proved a total failure, and for a while S. was in the deepest poverty and distress. Having a few years after made a hit, he speedily became famous, and ten years later was a wealthy man. Of his innumerable pieces, *Monsieur Garat*, *Nos Intimes*, *Les Diables Noirs*, *Dora*, *Les Bourgeois de Pontarsy*, are among the best known. He became a member of the Academy in 1878.

SARGA'SSUM. See GULF-WEED.

SARI', the capital of the province of Mazanderan, Persia, is situated on the banks of a small stream, the Tejend, 18 miles south of the Caspian Sea. It is a modern town, built near the ruins of a very ancient one, and contains a pop. of about 25,000, who carry on a small trade with Russia, and with the interior of Persia. It stands in the midst of fine gardens.

SARK, one of the Channel Islands. See JERSEY.

SARMA'TIANS. The root *s-rm* in this word is in all probability the same as *s-rb*, so that it has been conjectured the name S. has the same ethnological meaning as *Serbi* and *Servi*. The oldest Greek form of the word (and the only one found in Herodotus is *Sauromatæ*. The region occupied by the S. embraced (according to Ptolemy, our chief authority) a portion both of Europe and Asia.—1. The *European S.* are found as far west as the Vistula; as far north as the Venedicus Sinus (Gulf of Riga?), or even further; as far east as the Crimea and the Don; and as far south as Dacia. Roughly speaking, their territory corresponded to modern Esthonia, Lithuania, Western Russia, and parts of Poland and Galicia. The principal, or at least the best-known nations among the European S., were the Peucini and Bastarnæ, about the mouths of the Danube, and in Moldavia and Bessarabia; the Jazyges and Roxolani, probably in Kherson, Tauris, and Ekaterinoslav; the Venedi and Gythones, about Riga, Memel, and Elbing; and the Avareni, at the sources of the Vistula.—2. *The Asiatic S.* are found as far west as the Tanais (Don), as far east as the Caspian, as far south as the Euxine and Caucasus, and as far north as the water-shed between the rivers that fall into the White Sea and the Black, but we have no distinct knowledge of their territorial possessions.

North of the Don, in the region now occupied by the Don Cossacks, dwelt the *Perierbidi;* south-east of it, about Astrakhan, the Jaxamatæ. Beyond the Perierbidi lay the Asæi, the 'horse-eating' (*Hippophagi*) Sarmatæ, the 'Royal' and Hyperborean Sarmatæ, and many others, besides a multitude of nations in the region of the Northern Caucasus. The question naturally arises: What were these Sarmatians? The vast extent of territory over which they spread, and the manifest inclusion under the name S. of different races, as, for example, Goths, Finns, Lithuanians, Circassians, Scythians, and Slaves, prove that the term was loosely used by Ptolemy and his contemporaries, just like the older Herodotean term Scythia, and is not strictly ethnological; yet Dr. Latham's view (see Smith's *Dictionary of Greek and Roman Geography*, arts. Sarmatia and Scythia), that it designated on the whole Slavic races, and in particular the north-eastern portion of the great Slavic family, may be regarded as tolerably certain. The S. figure prominently among the barbarians who vexed the north-eastern frontiers of the Roman Empire.

SA'RNO, a city of Southern Italy, in the province of Salerno, on the river of the same name, 13 miles north-west of Salerno. It is a well built town, with a very handsome cathedral containing some good paintings, and has a seminary for priests, a hospital, several paper-manufactories, and foundries. Its environs are famous for the produce of very fine silk. In the center of the town, there are springs of sulphureous and chalybeate waters. Among the buildings worthy of notice is the ancient castle of the Barberini family. Pop. 10,933.

In the plain near S., Teias, king of the Goths, in a desperate battle with the Greeks, commanded by Narses, in 553, was vanquished and slain, and the reign of the Goths in Italy brought to a close.

SARPI, PIETRO, better known by his monastic appellation, FRA PAOLO, or Brother Paul, was born at Venice, in the year 1552; became an early proficient in mathematics, as well as in general literature, resolved to embrace the monastic life, and in his 20th year took the vows in the religious order of the SERVITES (q. v.). Soon afterwards, he was appointed by the Duke of Mantua to a professorship of theology in that city; but he held it only for a short time; and returning to his order, of which he was elected provincial in his 27th year, he continued to pursue in private his studies in languages, in mathematics, in astronomy, and in all the other branches of natural philosophy, including the medical and physiological sciences, in which he attained to great proficiency, being by some writers regarded (although, as it would seem, without sufficient grounds) as entitled to at least a share in the glory of the discovery of the circulation of the blood. The freedom of some of his opinions led to his being charged at Rome with heterodox views, and although held free from actual heresy, his opinions became an object of suspicion; and in the dispute between the republic of Venice and Paul V. (q. v.) on the subject of clerical immunities, S. justified these suspicions by the energy with which he threw himself into the anti-papal party. On being summoned to Rome to account for his conduct, he refused to obey, and was accordingly excommunicated as being contumacious. The zeal of S.'s opposition to Rome drew upon him the hostility of the partisans of the Roman claim; and an attempt was even made upon his life by a band of assassins, whom the ardor of party-spirit at the time did not hesitate, although, upon mere presumption, to represent as emissaries of the Jesuits.

Fra Paolo himself openly professed to share this suspicion, and believing his life in danger, confined himself thenceforward within the enclosure of his monastery. It was in this retirement

that he composed his celebrated *History of the Council of Trent*, which has long been the subject of controversy and criticism. It was published in London by Antonio de Dominis, the ex-bishop of Spalatro, who had recently conformed to Protestantism, at first under the pseudonym of *Pietro Soave Polano*, an anagram of the real name of the author, *Paolo Sarpi Veneto;* and it almost immediately rose into popularity with the adversaries of Rome as well in England as throughout the continent. It is by no means a simple history of the proceedings of the Council, but rather a controversial narrative of the discussions, in which the writer freely enters into the merits of the doctrines under discussion, and in many cases displays a strong anti-Catholic bias. His judgment of the motives and of the conduct of the members of the Council, especially of the representatives of the pope and his partisans in the assembly, is uniformly hostile, and has been accepted by Protestants as a strong testimony against Rome from a member of the Roman Church. It must be confessed, however, that whatever judgment we may form of S.'s credibility on his own merits, it is idle to look upon him in the light of a member of the church of Rome. It is plain, from numberless declarations in his work, and from remains of his correspondence published after his death, that his opinions were strongly biassed, not merely with an anti-Roman, but even with rationalistic leanings; and Ranke does not hesitate to declare that his unsupported statements cannot be accepted with security, when there is question of a damaging narrative of some intrigue of the legates in the Council, or some cabal of the Italian bishops in the interest of Roman views. A voluminous counter-history of the Council of Trent was written by the Roman Jesuit (afterwards Cardinal) Pallavicino, which follows him into the details as well of the history as of the controversy.

It would be out of place here to enter into any comparison of these rival histories of the Council. The history of S. has been translated into most of the European languages. The French translation is by the celebrated Courrayer, and is enriched with copious vindicatory and critical annotations. S. lived in the full vigor of intellect to the age of 71, and died of a neglected cold, which led to a protracted illness, in the year 1623. His life, as an ecclesiastic, was without reproach; and his long-tried zeal in the cause of the republic had made him the idol of his fellow-citizens. He was honored accordingly by the republic with a public funeral. His *History of the Council of Trent* has been reprinted in numberless editions; and his collected works were published at Verona in 8 vols. 4to, 1761—1768, and again at Naples, in 24 vols. 8 vo, in 1790.

SARRACE'NIA or SIDE-SADDLE FLOWER, a genus of very singular marsh plants, natives of North America. *S. purpurea* is common from Hudson's Bay to Carolina; the other species are confined to the Southern States. They are herbaceous perennial plants, with radical leaves and scapes, which bear one or more

Sarracenia purpurea:
1, a flower, from which the corolla has fallen off, showing the very large 5-angled stigma; *a*, a fully expanded flower; *b*, germen; *c*, section of the fruit.

large flowers. The leaves are of very remarkable structure, the stalk being hollow and urn-shaped, and the blade of the leaf articulated at its apex, and fitting like a lid. It is from the form of the leaves that the name Side-saddle Flower is derived.—The genus is the type of the small natural order *Sarraceniaceæ*, the only other genus of which has been discovered in Guyana. The order is closely allied to *Papaveraceæ*.

SARREGUEMINES (Ger SAARGEMUND), formerly a frontier town in the N. of France, but since the war of 1870—71 in the possession of Germany, is in the province of Alsace-Lorraine, 41 m. E. of Metz. It is famous for its pottery; hempen fabrics and velvets are also made. Pop. (1880) 9573.

SARSAPARI'LLA, or SARSA. This much employed medicine is the produce of several species of *Smilax* (q. v.), although the species yielding the different kinds brought to the market have not yet been fully ascertained. Among them, the three

Sarsaparilla.

principal are believed to be *S. officinalis*, *S. medica*, and *S. papyracea;* twining shrubs, with prickly angular stems; the first with large ovate-oblong, acute, heart-shaped, leathery leaves; the second with shortly acuminate smooth leaves; the lower ones heart-shaped, the upper ones approaching to ovate; the third with membranous, oval-oblong, obtuse leaves. These shrubs are natives of warm parts of America; *S. officinalis* and *S. papyracea* being found in South America, and *S. medica* on the Mexican Andes. Some botanists regard them as mere varieties of one species.

The part of the plant used in medicine is the dried root, of which the following are the characters, as given in the British Pharmacopœia: 'Roots not thicker than a goose-quill, generally many feet in length, reddish-brown, covered with rootlets, and folded in bundles about eighteen inches long, scentless; taste mucilaginous, feebly bitterish, faintly acrid.' S. has been analyzed by various chemists, and appears to consist of volatile oil, most of which is expelled during the process of drying, of a white crystallizable neutral substance named *Smilacin*, whose composition is represented by the formula $C_{16}H_{13}O_6$, an acrid bitter resin, lignin, starch, and mucilage. S. is one of the class of medicines called Diaphoretics. The British Pharmacopœia contains three preparations of this drug—viz., the Decoction, the Compound Decoction (containing S., sassafras chips, guaiac wood-turnings, liquorice root, and mezereon), and the Liquid Extract. The cases in which they are serviceable are those of chronic rheumatism, secondary syphilitic affections, chronic skin diseases, &c. To be of any service, S. must be taken in considerable doses. The compound decoction, formerly known as the *Decoction of Sweet Woods*, is the best preparation, and should be taken in doses of four or six ounces three times a day.

The root of *S. aspera*, a native of the south of Europe, is used as a substitute for S., although of inferior quality, and is called Italian sarsaparilla.

The root of *Hemidesmus Indicus*, a climbing shrub of the natural order *Asclepiaceæ*, is used in India as a substitute for S., and is therefore called Indian sarsaparilla. The plant is common in all parts of India. The root has a peculiar aromatic odor and bitter taste. In consequence of the high price charged for genuine S., the root of *Hemidesmus Indicus*, or *Indian Sarsaparilla*, has been introduced into the British Pharmacopœia. The following are its characters: 'Yellowish-brown, cylindrical, tortuous, furrowed, and with annular cracks, having a fragrant odor, and a very agreeable flavor.' The only officinal preparation is the Syrup; but in India, where this root is highly esteemed as a diaphoretic and tonic, and is extensively used as a substitute for S., an Infusion, prepared by infusing two ounces of the root in a pint of boiling water, is generally employed, the dose being from two to four ounces three times a day. The syrup is chiefly used, in consequence of its pleasant flavor, as a vehicle for more active medicines.

In Germany, the roots of *Carex arenaria*, *C. disticha*, and *C. hirta* (see CAREX) are occasionally used as a substitute for S., under the name of German sarsaparilla.

SARTHE, an inland dep. of France, north of the Loire. Area, 2390 sq. m.; pop. (1881) 438,917. It is a country of plains, traversed by low hills and by undulations clothed with vines, of large picturesque forests, and of pleasant valleys. The soil is fertile, productive in grain and in clover; hemp is cultivated, and hempen fabrics largely manufactured. The wine produced is of a mediocre quality. The climate is healthy and temperate. Clover-seeds are exported to England and Holland, and swine and cattle

are reared in large numbers for the Paris and other markets. S. is divided into the four departments of Mans, La Flèche, Mamers and St. Calais. The capital is Le Mans. See MANS, LE.

SARTI, GIUSEPPE, one of the most skilful and learned musical composers of the 18th c., was born at Faenza in the Papal States in 1729. He studied under Padre Martini at Bologna; and in 1752 produced his first opera, *Il Re Pastore*, which was performed at Faenza with great success. He held for a time the office of *Hof Kapellmeister* at Copenhagen, but returned to Italy in 1765. In 1770, and the following years, he composed his principal operas, including *Le gelosie villane* and *Giulio Sabino*, the latter of which was enthusiastically received throughout Italy, and is highly praised by Dr. Burney. In 1779, he became *maestro di capella* of the Duomo at Milan, and gave himself to the composition of church music. In 1784, he went to St. Petersburg as music director of the court of the Empress Catharine, by whom he was treated with great liberality, and raised to the highest rank of nobility. He died at Berlin in 1802, on his way to Italy. His operas are thirty in number; but the composition by which he is now most known is his beautiful sacred terzett, *Amplius Lave Me*. S. was the musical instructor of Cherubini (q. v.).

SARTO, ANDREA DEL, one of the most famous painters of the Florentine school, was born at Florence in 1488. According to later writers, the family name was Vannucchi, and Andrea only received the name of *del Sarto* (the Tailor) from the occupation of his father; but this statement is probably erroneous. S. was a pupil of Piero di Cosimo, but formed his style mainly through study of the works of Masaccio, Domenico, Ghirlandajo, and Buonarotti. These artists inspired him with a love of fresco-painting, in which he achieved great distinction.

During 1509—1514, he executed a series of representations from the life of St. Filippo Benizzi, in the porch of the Annunziata at Florence; and in these the characteristics of his genius—dignity of composition, purity of form, freshness of color, and grace of expression—are seen at their best. In 1514 he commenced a series of frescoes from the life of John the Baptist, which were not finished, however, till 12 years afterwards. The finest works, of what may be called his middle period, are the 'Madonna di San Francesco' and the 'Contending Theologians,' both in the Florentine galleries. In 1518, Francis I. invited S. to Paris, where he painted, among other things, the picture of 'Charity' in the Louvre; but at the solicitations of his wife, he returned to Florence, where he died in 1530. To the later years of his life, which were neither happy nor honorable, belong his 'Piety,' his most celebrated fresco the 'Madonna del Sacco' (in the Annuziata at Florence), the 'Madonna with Saints' (in the Berlin Museum), and the 'Sacrifice of Abraham' (in the Dresden Gallery). His largest fresco is the 'Lord's Supper,' in what was formerly the Abbey of San Salvi, near Florence.—See Reumont's *Andrea del Sarto* (Leip. 1835).

SA'RUM, OLD, an extinct city and borough of England, was situated on a hill two miles to the north of Salisbury, in Wiltshire. It dated from the time of the Romans, by whom it was known as *Sorbiodunum*, and remained an important town under the Saxons. A Witenagemôte was held at O. S. in 960; and here William the Conqueror assembled all the barons of his kingdom in 1086. It was the seat of a bishop from the reign of William the Conqueror till 1220, when the cathedral was removed to New Sarum, now Salisbury (q. v.), and was followed by most of the inhabitants. In Henry VII.'s time it was almost wholly deserted, and has so continued till the present time. Some traces of walls and ramparts, and of its cathedral and castle, are still seen. Though without a single house or inhabitant, two members represented it in parliament, till, like many other rotten boroughs, it was disfranchised by the Reform bill of 1832. William Pitt, Earl of Chatham, first sat in parliament for O. S. in 1735.

SARVASTIVADAS, or SARVASTIVADINS (lit., those who maintain the reality of all existence), is the name of one of the four divisions of the *Vaibhashika* system of Buddhism; its reputed founder was *Rahula*, the son of *the* Buddha S'akyamuni.— See C. F. Koeppen, *Die Religion des Buddha*, (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

SARZA'NA, a city of northern Italy, in the province of Genoa, 8 miles east of Spezia. Its cathedral, built in 1200, is very rich in paintings and marbles. There is also an ancient fortress built by the Pisans in 1262. It is the birthplace of Pope Nicholas V. Pop. (1871) 5396.

S. is a very ancient city, founded 176 B.C. The adjacent city of Luni having been sacked and destroyed by the Vandals and by the Normans, its inhabitants abandoned it, and took refuge in S., to which place they removed the episcopal see in 1204. There are stills remains of the amphitheater of Luni.

SASH, in the British Army, is a military distinction worn on duty or parade by officers and non-commissioned officers. For the former, it is of crimson silk; for the latter, of crimson cotton. By officers it is worn over the left shoulder, and by non-commissioned officers it is worn over the right shoulder. There are no sashes in cavalry regiments.

SASH. The frames in which the glass of windows is inserted are called window-sashes. Common windows are usually made with an upper and lower sash, contrived so that, by means of cords or chains, pulleys, and balance-weights, they slide up and down in a wooden case.

SASIN. See ANTELOPE.

SA'SINE. (See INFEFTMENT.) The ceremony was as follows: the attorney of the party giving the right produced his warrant of title, and gave it to the bailie or representative of the other party, who gave it to the notary to be explained by the latter to witnesses, and then the first party delivered earth and ground, that is, part of the very soil, to the other in presence of the witnesses. The notary then drew up an instrument reciting what had been thus done, and which was signed by the notary and two witnesses. In England, *seisin* never had so narrow and technical a meaning as it had in Scotland.

SASKA'TCHEWAN, a large, important, and only recently-explored river of British North America, draws its waters from the Rocky Mountains, and is formed by two head-waters called the South Branch or Bow River, and the North Branch. The South Branch issues from a lake about four miles long, fed by a glacier descending from a magnificent *mer de glace*, and by a group of springs in the vicinity. A few yards north of this group of springs is another group, from which the North Branch takes its rise. The height above the sea is 6347 feet; the lat., 51° 40′ N.; the long., 117° 30′ W. The South Branch flows south-east to its junction with the Belly River in long., 111° 40′ W., then north-east to its junction with the North Branch in long., 105° W. Fed mainly from the same glacier that feeds the South Branch, the North Branch flows north past Mount Murchison, 15,789 feet above sea-level, and one of the highest peaks of the Rocky Mountains, north through Kutanie Plain, a fine prairie abounding in game, and then flows in a general eastern direction to its confluence with the South Branch. From long. 105° W., the river flows east, and falls into Lake Winnipeg. Length of main river, 200 miles; of north branch, over 550 miles. From its mouth it is navigable (on the north branch) about two-thirds of its entire length. It flows through a country rich in coal and iron, with a healthy climate, and comprising almost boundless plains suited to the cultivation of grain. At the sources of the S., there are several easily practicable routes across the Rocky Mountains, especially the Vermilion Pass.—*Journal of the Geographical Society for* 1860; Earl of Southesk's *Saskatchewan* (1875).

SA'SSAFRAS (*Sassafras*), a genus of trees or shrubs of the natural order *Lauraceæ*, having dicœcious flowers, a 6-parted membranous perianth, 9 stamens, a succulent fruit placed on the thick fleshy apex of the fruit-stalk, and surrounded by the unchanged perianth. The S.-tree (*S. officinale*) of North America, found from Canada to Florida, a mere bush in the north, but a tree of 50 feet in the south, has deciduous leaves, yellow flowers which appear before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in fibre, dirty-white and reddish-brown, with a strong but agreeable smell, resembling that of fennel, and an aromatic, rather pungent and sweetish taste. The wood of the root possesses these properties in a higher degree than that of the stem, and the thick spongy bark of the root most of all. The wood is brought to market in the form of chips, but the bark of the root is preferred for medicinal use, is a powerful stimulant, sudorific, and diuretic, and is employed in cutaneous diseases, gout, rheumatism, and syphilis, generally in combination with other medicines. It contains a volatile oil, *Oil of S.*, which is often used instead. An agreeable beverage is made in North America by infusion of S. bark or S. wood; and a similar beverage was once very commonly sold at daybreak in the streets of London under the name of *Saloop*. A few saloop-venders are still to be seen plying their vocation. The leaves of S. contain so much mucilage that they are used for thickening soup—Another species of S. (*S. parthenoxylon*), possessing similar properties, is found in Sumatra.

SASSAFRAS NUTS. See PITCHURIM BEANS.

SASSA'NIDÆ, the dynasty which succeeded that of the Arsacidæ on the throne of Persia (q. v.), derived its name from Sassan, the grandfather of the newly-elected monarch ARDISHIR. The reign of the Sassanidæ is remarkable in the history of Persia, not for the extent of their sway, or the luxury and magnificence of their court, though in these respects they could vie with the Achæmenidæ at the epoch of their greatest power and splendor, but for the intense energy which they succeeded in infusing into the people at large. A comparatively small army of Greeks might and did successfully strive against the immense hordes of a Xerxes and a Darius; but the veterans of Rome could gain no

permanent laurels in a conflict with an equal force of Persians under the Sassanidæ. Ardishir made the desert of Khiva and the Tigris his boundaries, and resigned the throne to his son, SHAHPUR I. (SAPOR) (240—273 A.D.), who subdued Armenia, took Algezira (258) and Nisibis, totally routed the Romans at Edessa, taking prisoner the Emperor Valerian and the relics of his army, and overrunning Syria, Cappadocia, and other portions of Western Asia. This monarch paid as much attention to the prosperity of his subjects and the encouragement of the fine arts as he did to the extension of his power; but his enlightened plans were not carried out by his immediate successors.—NARSI (NARSES) (294—303) retook Armenia, and signally defeated the Romans under Galerius; but fortune deserted him in the following year (297).—His grandson, SHAHPUR II. (310—381), surnamed POSTHUMUS, an infant, succeeded, and Persia, during his minority, was much harassed by the Arabs, Romans, and Tartars; but Shahpur had no sooner taken in his hands the reins of government, than in return, he ravaged Yemen, punished the Tartars, and took the sole revenge at that time in his power against the Romans, by commencing a dreadful persecution of the Christians in his dominions.

A regular war speedily followed; the army of Constantius was routed at Singarah, and he was compelled to sue for peace. But the war continued, Constantius's successor, Julian, was defeated, and lost his life (363) near Ctesiphon, and the Romans were glad to conclude the humiliating peace of Dura. Armenia, Iberia, and the other Caucasian principalities were then reduced by Shahpur. The wholesome terror thus infused into the Romans effectually restrained them from aggressions for many years.—Among his successors were BAHARAM V. (420—448), surnamed GOUR, who recommenced hostilities with the Romans, the result being a partition of Armenia, and a truce for 100 years; and KOBAD (COBADES or CABADES) (488—498, 502—531), a wise and able monarch, who, on the Romans refusing any longer to pay the stipulated tribute, declared war against them, and defeated them in every engagement, concluding peace (505) on receiving 11,000 lbs. of gold. A second war, which commenced in 521, was from beginning to end in favor of the Persians, though the Romans at that time possessed a staff of generals unsurpassed at any previous epoch of their history. The war continued for some time after the accession of KHUSRU I. (q. v. (531—579), and was continued at intervals till nearly the conclusion of the century, when another great Persian conqueror, KHUSRU II. (q. v.) (591—628), ascended the throne; but the details of his annihilation of the Roman power in Asia, and the resistless march of Heraclius (q. v.), who again cooped up the Persians within the Tigris, and inflicted upon the S. a blow from which they never recovered, will be found under these names.—After four years of petty civil war, which wore out the remaining strength of the nation, YESDIGERD III. (632—651) was raised to the throne. The Arabs, who had already twice attacked Persia without success, made a third attempt in 639, and routed Yesdigerd's army at (Kudseah Cadesia) with immense loss.

Yesdigerd made another energetic attempt to rescue his kingdom; but the great battle of Nahavend, in which more than 100,000 Persians are said to have been slain, extinguished all hope of success; and the unfortunate monarch became a fugitive and a wanderer in Northern Khorassan till 651, when he was treacherously murdered.—Thus perished the dynasty which had pulled down the Romans from their proud pre-eminence among nations by the hands of a horde of robber-fanatics, under whose barbarous rule the extensive commercial prosperity and refined civilization which had been so carefully fostered for four centuries, were utterly swept away, leaving only such traces as ruined aqueducts, choked-up canals, and the still magnificent remains of almost forgotten cities.

SA'SSARI, a city in the north-west of the island of Sardinia, the chief town of the province of the same name, 8 miles from the shore of the Gulf of Asinara. It is a handsome and important archiepiscopal city, and has a vast cathedral, with many sculptures, one of which is by Canova; a university, founded in 1776; a college; and a rich library, with the MSS. of the Azuni. S. is a very busy town, and trades especially in grain, wine, fruits, wood, olive oil, and tobacco. Its harbor, Torres, is 10 miles north-west of S.; it is narrow and shallow, and does not admit large vessels. Pop. (1881) 31,596.

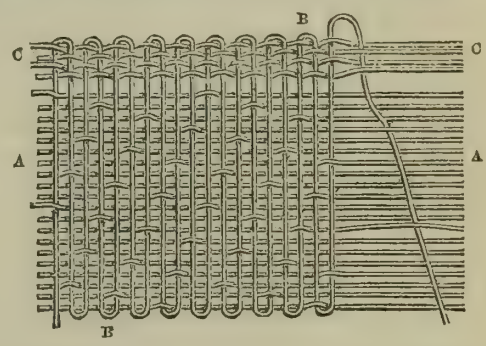
SATA'LIAH, another name of Adalia (q. v.).

SATAN. See DEVIL.

SÁTÁRÁ, generally spelled *Sattara*, a collectorate in the Southern Division of the province of Bombay, British India, is bounded on the N. by the state of Poona, and on the W. by the lofty ridge of the Western Ghauts. Area, 5371 sq. m.; pop. (1872) 1,052,853. SATARA, the capital, from which the state derives its name, one of the most salubrious and pleasant stations in the Deccan, 133 miles south-east of Bombay. Pop. (1872) 24,484.

SA'TELLITES (Lat. *satelles*, an attendant) are certain celestial bodies which attend upon and revolve round some of the planets as these latter revolve round the sun; and hence scientific men frequently apply to them the generic term, 'secondary planets.' The Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, each possesses one or more of these attendants. The eclipses, inequalities, inclinations, and reciprocal attractions of the satellites, have been carefully noted from time to time, and the theory of their motions, at least of the most prominent of them, has been found to coincide with that of the moon. The satellites of Jupiter are invested with additional interest, from their eclipses having been the means of directing Römer to his great discovery of the successive propagation and velocity of light. On careful investigation, he found that the eclipses regularly happened 16′ 26″ earlier when the planet was in opposition (i. e., nearest the earth), than when it was in conjunction (i. e., furthest from the earth), a phenomenon which could only be accounted for by the supposition, that light requires 16′ 16″ to pass over a distance equal to the diameter of the Earth's orbit.

SATIN, a fabric in which so much of the weft is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and weft cross each other more frequently; this will be better understood by reference to the figure than by any verbal description. A are the warp threads, of which only every tenth one is raised to allow



the shuttle to pass, but they are all raised in regular succession, so that the weaving is quite uniform throughout; B are the weft threads; and C is the selvedge, which is formed on each side of the piece of stuff by the regular method of plain-weaving, that is, by raising every other warp thread for the passage of the weft. The term satin is very rarely applied to any other than silk fabrics, woven as described; but there are woollen, linen, and cotton satins known in the markets.

SATIN-BIRD. See BOWER-BIRD.

SA'TINET, an inferior satin, woven much thinner than the ordinary kind. The term is also occasionally applied to a variety of cloth woven with cotton warp and woollen weft.

SATIN-WOOD, a beautiful ornamental wood obtained from both the West and East Indies. The former is the better kind, and is supposed to be the produce of a moderate-sized tree, *Ferolia Guianensis*, and probably other species, as there are several varieties of the wood. That from the East Indies is less white in color, and is produced by *Chloroxylon Swietenia*. Both are much used by cabinet-makers, and for marquetry, &c. The logs are usually only 6 or 7 inches square.

Chloroxylon Swietenia is a tree of the natural order *Cedrelaceæ*, growing on the mountains of the Circars in India, and in Ceylon. Sir James E. Tennent says that 'in point of size and durability, it is by far the first of the timber-trees of Ceylon. The richly-colored and feathery logs are used for cabinet-work, and the more ordinary for building purposes, every house in the eastern province being floored and timbered with satin-wood.'—Tennent's *Ceylon*.

SA'TIRE (Lat. *satira;* older form, *satura*), the name given by the Romans to a species of poetry of which they may be considered the inventors. The word *satura* (from the root *sat*, enough) is strictly and originally an adjective, meaning 'full' or 'filled;' but afterwards it came to possess also a substantive signification, and denoted a dish filled with a medley of ingredients, like the *Pot-pourri* (q. v.) of the French, or the *Olla Podrida* (q. v.) of the Spaniards. Hence, in its figurative application to a branch of literature, it throws a light on the primary character of that literature. The oldest Roman satire was a medley of scenic or dramatic improvisations expressed in varying metres (Livy, lib. 7, cap. 2), like the Fescennine Verses (q. v.); but the sharp banter and rude jocularity of these unwritten effusions bore little resemblance, either in form or spirit, to the earnest and acrimonious criticism that formed the essential characteristic of the later satire. The earliest—so far as we know—who wrote *saturæ*, were Ennius

(q. v.) and Pacuvius; but the metrical miscellanies of these authors were little more than serious and prosaic descriptions, or didactic homilies and dialogues. Lucilius (b. 148, d. 103 B.C), is universally admitted to be the first who handled men and manners in that peculiar style which has ever since been recognized as the satirical; and the particular glory of Lucilius, in a literary point of view, consists in this, that he was the creator of a special kind of poetry, which in all subsequent ages has been the terror and aversion of fools and knaves. The serious, and even saturnine gravity of the Roman mind must have readily disposed it to a censorious view of public and private vices.

After the death of Lucilius, satire, as well as other forms of literature, languished, nor do we meet with any satirist of note till the age of Horace (q. v.), whose writings are as a glass in which we behold mirrored the tastes and habits of the Augustan age. His satire, though sharp enough at times, is in the main humorous and playful. It is different when we come to Juvenal (q. v.)—a century later, when satire became a *sæva indignatio*, a savage onslaught on the tremendous vices of the capital. Persius (q. v.), who lived in the generation before Juvenal, is every way inferior, in force of genius, to the latter. After Juvenal, we have no professed satirist, but several writers, prose and poetic, in whom the satiric element is found, of whom Martial, the epigrammatist, is perhaps the most notable.

During the middle ages, the satirical element showed itself abundantly in the general literature of France, Italy, Germany, England, and Scotland. Men who have a claim to the character of satirists, *par excellence*, are Ulrich von Hutten, one of the authors of the *Epistolæ Obscurorum Virorum* (q. v.), Erasmus, (q. v.), Rabelais (q. v.), Sir David Lindsay (q. v.), George Buchanan (q. v.). In all of these writers, priests are the special objects of attack; their vices, their greed, their folly their ignorance, are lashed with a fierce rage. But it was in France that satire as a formal literary imitation of antiquity first appeared in modern times. Vauquelin (q. v.) may be considered the true founder of modern French satire. The satirical verses of Mottin, of Sigogne, and of Berthelot, of Mathurin Regnier, *L'Espadon Satirique* of Fourqueraux, and *Le Parnasse Satirique*, attributed to Théophile Viaud, are very impure in expression, and remind us that at this time a satire was understood to be an obscene work—the 17th c. scholars supposing that the name had something to do with Satyr, and that the style ought to be conformed to what might be thought appropriate to the lascivious deities of ancient Greece!

During the 17th and 18th centuries, both England and France produced professed satirists of the first order of merit, who have not been surpassed by the best either of their predecessors or successors. The names of Dryden (q. v.), Butler (q. v.), Pope (q. v.), and Churchill (q. v.) on this side of the Channel, of Boileau (q. v.) and Voltaire (q. v.) on the other, are too well known to require more than mention. Dr. Edward Young (q. v.) and Dr. Johnson (q. v.) have also made a name for themselves in this branch of literature. It may be noticed, however, as a distinguishing characteristic of Dryden, Boileau, Young, Pope, Churchill, and Johnson, and as a mark of the difference of the times in which they lived from those of the satirists of the Reformation, that it it is no longer the church that is assailed, but society, political opponents, literary rivals, &c.; the war is carried on, not so much against bad morals in the clergy, as against the common vices of men in general, or is even the expression of partisan hatreds. Swift (q. v.) and Arbuthnot (q. v.) are perhaps as great satirists as any of those we have mentioned.

Satire in the shape of political squibs, lampoons, &c., is very abundant in the 17th and 18th centuries. Butler's *Hudibras* is simply one long lampoon against the Puritans; most of the playwrights of the Restoration were royalist satirists—unscrupulous and indecent partisans. Dryden himself was but *facile princeps* of the herd. Andrew Marvell (q. v.) is the most famous name on the side of liberty. The *Beggars' Opera* of the poet Gay is a piece of very fine political satire. Gifford (q. v.) and Wolcot (q. v.), better known as Peter Pindar, also deserve mention in a historical point of view, though their intrinsic merits are small. Incomparably superior to all their contemporaries, and among the first order of satirists, are Robert Burns (q. v.) and Cowper (q. v.).—Meanwhile, in France, since Voltaire, no great name has appeared, except, perhaps, that of Béranger (q. v.), though the spirit of satire has pervaded most of the current literature, more particularly political literature, of which one of the latest expressions is the pamphlet published in 1865 by M. Rogeard against the system of government pursued by Napoleon III., and entitled *Les Propos de Labienus*. In Germany, the most conspicuous modern names are those of Hagedorn, Rabener, Sturz, Stolberg (q. v.), Kästner, Wieland (q. v.), Tieck (q. v.), and Goethe (q. v.), but none of these have adhered very strictly to the classic models of satire. Of 19th c. satirists in England, the best names are Byron (q. v.), the brothers Smith (q. v.), and Hood (q. v.) in poetry; and Hook (q. v.), Jerrold (q.v.), Thackeray (q. v.), and Carlyle (q. v.) in prose. To these may be added the name of the author of the *Biglow Papers*, James Russell Lowell.—See Sellar's *Roman Poets of the Republic* (2d ed. 1881); Browne's *History of Roman Classical Literature* (Lond. 1853); Thomson's *History of Roman Literature* (forming a volume of the *Encyclopædia Metropolitana*); Mommsen's *History of Rome;* Niebuhr's *Lectures on Roman History;* M. Viollet le Duc, article 'Satire' in the *Dictionnaire de la Conversation;* and James Hannay's *Satire and Satirists*.

SA'TRAP, in the ancient Persian monarchy, was the governor of a province, whose power—so long as he enjoyed the favor of the king—was almost absolute. He levied taxes at his pleasure, and could ape the tyranny of his great master without let or hindrance. When the monarchy of Cyrus began to decline, some of the satraps threw off their slight allegiance, and founded independent kingdoms or sultanates of their own, the most famous of which in ancient times was the Mithridatic kingdom of Pontus. See PONTUS and MITHRIDATES.

SA'TURN, an ancient Italian divinity, who presided over agriculture. His name, from the same root as *satum* (*sero*, to sow), indicates what was probably one of the earliest personifications in the Italian religion, S. being the god who blessed the labors of the sower. His identification with the Greek KRONOS by the later Græcizing myth-mongers is a peculiarly infelicitous blunder, and has led to more than ordinary confusion. The two have absolutely nothing in common except their antiquity. The Greek *Demeter* (Ceres), it has been observed, approaches far more closely to the Italian conception of the character of Saturn. The process of amalgamation in the case of Kronos and S. is visible enough. First, there is the Greek myth. Kronos, son of Uranos (Heaven) and Gæa (Earth), is there the youngest of the Titans. He married Rhea, by whom he had several children, all of whom he devoured at birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of Kronos for this horrible conduct was his hope of frustrating a prophecy which declared that his children would one day deprive him of his sovereignty, as he had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus, had grown up, he began a great war against Kronos and the Titans, which lasted for ten years, and ended in the complete discomfiture of the latter, who were hurled down to Tartarus, and there imprisoned. So ran the common myth. But other myths added, that after his banishment from heaven, Kronos fled to Italy, where he was received hospitably by Janus, who shared his sovereignty with him. At this point the Greek myth coalesced with the Italian.

S., the old homely deity of the Latin husbandmen, was transformed into a divine king, who ruled the happy aborigines of the Italian peninsula with paternal mildness and beneficence, taught them agriculture and the usages of a simple and innocent civilization, and softened the primitive roughness of their manners. Hence the whole land received from him the name of *Saturnia*, or 'land of plenty.' His reign was that 'golden age,' of which later poets sang as the ideal of earthly happiness, and in memory of which the famous *Saturnalia* (q. v.) were thought to have been instituted. At the foot of the Capitoline, where the fugitive god had formed his first settlement, there stood in historical times a temple dedicated to his worship. Ancient artists represented him as an old man, with long, straight hair, the back of his head covered, his feet swathed in woollen ribbons, a pruning-knife or sickle-shaped harp in his hand. Other attributes, as the scythe, serpent, wings, &c., are of later invention.

SATURN. See PLANETS.

SATURNA'LIA, an ancient Italian festival, instituted, according to the common belief of the ancients, in memory of the happy reign of Saturn (q. v.). Discarding all mythical explanations of the institution of the S. as simply incredible, and not worth the trouble of refutation, we may rationally conjecture that the S. was a rural festival of the old Italian husbandmen, commemorative of the ingathering of the harvest, and therefore of immemorial antiquity. It is not, we conceive, to be doubted for a moment that the untrammelled jollities of the S. were familiar to the farmers of Latium long before their homely national god, who blessed the labors of seedtime with abundant fruit, had been decorated with incongruous Hellenic honors, and transformed into a skyey Titan. Later ages may have introduced novel elements into the S. befitting the hybrid myth of king Saturn, but originally, no thoughtful investigator can doubt that the cessation from toil, and the wild self-abandoning mirth that marked the feast, were expressive of the laboring man's delight that the work of the year was over, and not of an artificial enthusiasm for a 'golden age' that never had been.

The great feature of the S., as we know the festival in historical times, was the temporary dissolution of the ordinary conditions of ancient society. The distinctions of rank disappeared or were reversed. Slaves were permitted to wear the *pileus*, or badge of freedom, and sat down to banquets in their master's clothes, while the latter waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress, shout-

ing *Io Saturnalia;* sacrifices were offered with uncovered head; friends sent presents to each other; all business was suspended; the law-courts were closed; school-boys got a holiday; and no war could be begun. During the Republic, the S. proper occupied only one day—the 19th of December (xiv. Kal. Jan.). The reformation of the calendar by Julius Cæsar caused the festival to fall on the 17th (xvi. Kal. Jan.), a change which produced much confusion, in consequence of which the Emperor Augustus ordained that the S. should embrace the whole three days 17th, 18th, and 19th of December. Subsequently the number was extended to five, and even seven, though even in the times before the Empire, it would appear that the amusements often lasted for several days. But while the whole week was regarded in a general sense as devoted to the S., three distinct festivals were really celebrated—the S. proper; the *Opalia*, in honor of *Ops*, the wife of Saturn, and the goddess of field-labor (from *opus*, a work); and the *Sigillaria*, in which *sigilla*, or little earthenware figures, were exposed for sale, and purchased as children's toys. The modern Italian Carnival (q. v.) would seem to be only the old pagan S. baptized into Christianity.

SATU'RNIAN VERSE, the name given by the Romans to that species of verse in which their oldest poetical compositions, and more particularly the oldest national poetry, were composed. In the usage of the later poets and grammarians, the phrase has two different significations. It is applied in a general way to denote the rude and unfixed measures of the ancient Latin ballad and song, and perhaps derived its name from being originally employed by the Latin husbandmen in their harvest-songs in honor of the god Saturn (q. v.). In this sense, it simply means *old-fashioned*, and is not intended to determine the character of the metre. In is also applied to the measure used by Nævius, and a common opinion, sanctioned by the great name of Bentley, is, that it was a Greek metre introduced by him into Italy. But though the Saturnian verse is found among the measures employed by Archilochus, scholars generally incline to the opinion that this is an accidental coincidence, that the measure of Nævius is of Italian (Hermann even thinks of Etruscan) origin, and that it merely improved on the older ballad-metre—the primitive Saturnian verse. It continued in use down to the time of Ennius (q. v.), who introduced the Hexameter (q. v.). According to Hermann, the basis of the verse is contained in the following *schema :*

which, as Macaulay happily points out, corresponds exactly to the nursery rhyme,

The queén was in her párlor | éating bréad and hóney,

and is frequently found in the Spanish poem of the *Cid*, the *Nibelungen Lied*, and almost all specimens of early poetry; but in the treatment of it a wide and arbitrary freedom was taken by the old Roman poets, as is proved by the still extant fragments of Nævius, Livius Andronicus, Ennius, and of the old inscriptionary tables which the *triumphatores* set up in the Capitol, in remembrance of their glorious achievements.—See *History of Roman Literature*, by Thompson, Arnold, Newman, &c. (*Encyclopædia Metropolitana*, 1852); Browne's *History of Classical Roman Literature* (1853); Niebuhr's *History of Rome;* Preface to Macaulay's *Lays of Ancient Rome;* and Sellar's *Roman Poets of the Republic* (1863; new ed. 1881).

SATYRI'ASIS (see SATYRS) is the insanity, or the ungovernable sway of the lowest instincts and propensities, by which man becomes an animal in its savage and excited state. The ancients were acquainted with this loathsome form of alienation, in which man is the sport of foul and dangerous instincts, and recognizes no law or hindrance to the promptings of hunger, thirst, or lust. It still appears at puberty and in dotage, but is more rarely met with; and its disappearance may be hailed as significant of the predominance of the higher sentiments, or of the subjection of propensities to law, decency, and decorum.—Mason Good, *Study of Medicine*, vol. v. p. 124; Sauvages, vol. ii. p. 214.

SA'TYRS, in Greek Mythology, were a race of woodland deities, first mentioned by Hesiod, who designates them 'the race of worthless Satyrs unfit for work.' Subsequently, they figure in great numbers in the train of Dionysus (Bacchus)—their leader being that model of tipsy revelers, the never-sober Silenus! In appearance they were at once grotesque and repulsive, like all old woodland demons. They are described as robust in frame, with broad snub noses, large pointed ears like those of animals (whence they are sometimes called *theres*, 'wild beasts'), bristly and shaggy hair, rough skin, little horny knobs on their foreheads, and small tails. The S. are of course sensual in their inclinations, and ravishers of the woodland nymphs, fond of music, dancing, wine, and of the deep slumbers that follow a debauch. The Roman poets identified them with the *Fauni* of their own mythology, and gave them larger horns and those goats' feet with which they are so often represented. Ancient sculpture was fond of the Satyr as a 'subject'—one of the most famous specimens of ancient art being the Satyr of Praxiteles (q. v.).

SAUCES are preparations of various condiments, used for the purpose of giving piquancy and flavor to various kinds of food, chiefly animal. Sauces have been in use from the earliest times of culinary art. The ancients prided themselves much upon them, and used them almost wholly with fish. Sauces were used by the Greeks, but seemed to have arrived at the summit of their reputation in the time of the Roman Empire, when that called *garum*, made from a fish called *garon* by the Greeks, probably the anchovy, was considered one of the greatest luxuries of the table. Besides the garum, many other sauces were made of the tunny and other fishes. In modern times, we have sauces in great variety: there are those ready prepared, as Harvey's, Worcestershire, Yorkshire Relish, &c., the basis of which is Ketchup (q. v.), which of itself is one of the most extensively known sauces; and there are a large number prepared, when wanted, by the cook, to suit every kind of dish sent to the table. These usually consist of rich gravies, thickened with flour or other materials, and flavored with some suitable condiment. One of the reproaches of British cookery is the extensive use of a sauce called melted butter, which is usually little better than bill-stickers' paste, and which at the best is a little flour, water, and butter warmed together, and well mixed; and it is the habit to serve this to almost every kind of dish needing a sauce, whether animal or vegetable.

SAU'CISSON, or SAUSAGE, is a fascine of more than the usual strength; but the principal application of the term is to the apparatus for firing a military mine. This consists of a long bag or pipe of linen, cloth, or leather, from one inch to one and a half inch in diameter, and charged with gunpowder. One end is laid in the mine to be exploded; the other is conducted through the galleries to a place where the engineers can fire it in safety. The electric spark is now preferred to the saucisson. See BLASTING.

SAUER-KRAU'T, a preparation of the common white cabbage, well known and in extensive use in Germany and the north of Europe, where it supplies during the winter the place of fresh vegetables. The cabbages are gathered when they have formed firm white hearts; and these, sliced into thin shreds, are placed in a succession of thin layers in a cask, each layer being sprinkled with fine salt, to which some add juniper berries, cumin seed, caraway seeds, or other condiment. A board is then placed on the top, with a heavy weight, so as to press the whole down firmly, but gently. After a time, fermentation begins; and when a sour smell arises from the cask, it must be removed into a cool place, and kept for use. It is generally eaten boiled, in the same way as fresh cabbage.

SAU'GOR, a town of India, the chief town of a district in the Central Provinces, is situated in a hilly tract, on the Bees, or Bes, a feeder of the Jumna, in lat. 23° 50′ N., and long 78° 49′ E. S. is the seat of a military cantonment and of a collegiate school. The elevation is so considerable, that the climate is moderately cool; but the cantonment is unhappily in a swampy and unhealthy situation. Pop (1872) of town, 45,655; of dist., 527,725.

SAUL, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. The circumstances that marked his election to the royal dignity are familiar to all the readers of Scripture, and need not be repeated here (see JEWS, SAMUEL). Gigantic in stature, noble in mien, and imperious in character, he appeared admirably fitted to accomplish the task of consolidating the dislocated tribes of Israel. His earlier achievements augured hopefully for his future. The deliverance of the men of Jabesh Gilead, above all, his victories over the Philistines, the Moabites, Ammonites, Edomites, and Amalekites, were unmistakable proofs of his vigorous military capacity, but gradually there showed itself in the nature of the man a wild perversity—'an evil spirit of God,' as it is called—culminating in paroxysms of insane rage, which led him to commit such frightful deeds as the massacre of the priests of Nob. Samuel, who had retired from the 'court' of S., and had secretly anointed David as king, did not cease to 'mourn' for the wayward monarch; but nothing availed to stay his downward career, not even the noble virtues of his son Jonathan; and at last he fell in a disastrous and bloody battle with the Philistines on Mount Gilboa.

SAUMAREZ, JAMES, BARON DE, a celebrated naval hero, was descended from an old French family, which had long been settled in Guernsey, and was born there, 11th March 1757. He entered the navy as midshipman at the age of thirteen, and served in the American war (1774—1782), receiving for his gallantry at the attack of Charleston (1775) the grade of lieutenant; but he was recalled before the end of this war, and placed under Sir Hyde Parker. He did good service in the action off the Dogger

Bank (August 1781), and was rewarded with promotion to the rank of commander, being soon afterwards placed under the orders of Admiral Kempenfeldt on the Jamaica station. At the great fight between Rodney and De Grasse (12th April 1782), S. commanded the *Russell*, a line-of-battle ship, and gained much distinction by his coolness and intrepidity throughout. For his gallant capture of the French frigate *La Reunion*, with one inferior in size and equipment, he received the honor of knighthood; and in command of the *Orion*, a seventy-four, he served under Lord Bridport at the battle of l'Orient, June 23, 1795. He also took a prominent part in the battle off Cape St. Vincent (February 14, 1797), and was second in command at the battle of the Nile, in which he was severely wounded. In 1801, he became a baronet, and vice-admiral of the blue; and in the same year fought his greatest action off Cadiz (July 12), defeating a French-Spanish fleet of 10 line-of-battle ships and 4 frigates, with a squadron less than half their strength, and causing to the enemy a loss of 3000 men and three ships. This contest, than which, according to Admiral Nelson, 'a greater was never fought,' gained for S. the Order of the Bath, the freedom of the city of London, and the thanks of parliament. In the Russian war, he commanded the Baltic fleet, and took or destroyed two large Russian flotillas (July 1809). In 1814, he became admiral, vice-admiral of Great Britain in 1821, was created a peer in 1831, and died at Guernsey, 9th October 1836. His life has been written by Sir John Ross (*Memoirs of Admiral Lord de Saumarez*, 2 vols., 1838).

SAUMUR, a town of France, on the left bank of the Loire, in the dep. of Maine-et-Loire; 28 miles south-east of Angers by railway. Bridges connect the town with a suburb on the right bank of the river. The river-side is lined with handsome quays, and there are good bridges and agreeable promenades. There is a great cavalry school, in which riding-masters for the army are trained. The hôtel de ville and the castle are prominent buildings. Rosaries of cocoa-nut shell and articles in enamel are manufactured. The trade of S. is in spirits, wines, hemp, and linen. Pop. (1876) 13,463.

S., formerly the capital of the province of Saumurois, was a stronghold of the Protestants during the reign of Henry IV., at which time it contained 25,000 inhabitants. Its prosperity was annihilated by the revocation of the Edict of Nantes, and its population reduced to a fourth. Perhaps the most striking event in the history of the town was its brilliant capture by Larochejaquelein, and the Vendeans, June 10, 1793. In this action, the victors, with but a slight loss, captured 60 cannon, 10,000 muskets, and 11,000 republicans.

SAUNDERSON, NICHOLAS, LL.D., a distinguished English scholar, was born at Thurleston in Yorkshire in 1682. He became blind from small-pox at the age of twelve months, but received a good education, including instruction in the classics, which was orally communicated. His strong predilection for mathematics becoming known to his friends, attempts were made with success to instruct him in arithmetic, geometry, and algebra, by means of ingenious mechanical contrivances which it is not necessary to describe. In 1707, he came to Christ's College, Oxford, as a teacher, and there delivered a series of lectures on the Newtonian philosophy, including (strange to say) a discussion of Newton's theory of optics. Four years afterwards, he succeeded Whiston as Lucasian professor, and died 19th April 1739. A valuable and elaborate treatise on Algebra, from his pen, was published in 1740 (2 vols., 8vo), and another on Fluxions, including a commentary on some parts of Newton's *Principia*, in 1756. The mental process by which he was enabled to understand the rules of perspective, the projections of the sphere, and some of the more recondite propositions of solid geometry, seems to have been peculiar to himself, and was almost wholly unintelligible to others.

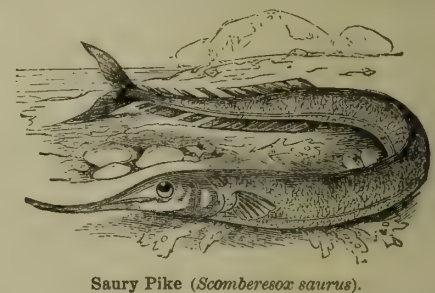
His sense of feeling was extremely acute; and he is said even to have been able to distinguish, by this sense alone, true Roman medals from counterfeits. He could judge fairly of the size of a room and of his position in it by the sound of his own footsteps, and could tell, in some inexplicable manner, when light clouds were passing across the sun's disc.

SAU'RIA, in the systems of Cuvier and other recent naturalists, an order of Reptiles (q. v.), having an elongated body, covered with scales or with bony plates; a more or less elongated tail; four limbs, or sometimes only two apparent, the rudimentary hind-limbs being concealed beneath the skin; the mouth always furnished with teeth; the ribs movable, rising and falling in respiration; the young issuing from the egg in a form similar to that of the mature animal.—To this order belong Crocodiles, Alligators, &c.; Chameleons, Geckos, Iguanas, Agamas, Varans, Teguixins, Lizards, Skinks, &c., numerous families, some of which contain many genera and species. Crocodiles and their allies, being covered with bony plates instead of overlapping scales, are by some naturalists removed from amongst the Saurians, and a place nearer to the Chelonians is assigned to them. In their general form and structure, however, they correspond with Saurians, and have no resemblance to Chelonians. The recent S. are far excelled in size and in variety of strange forms by the fossil S., as the *Plesiosaurus*, *Ichthyosaurus*, &c.

SAURIN, JACQUES, a celebrated French Protestant preacher, was born at Nîmes, 6th January 1677, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. But the climate of England did not agree with his delicate health; and in 1705 he settled at the Hague, where his extraordinary gift of pulpit oratory was prodigiously admired, but not by his clerical brethren, who enviously assailed him with the accusation of heresy. The ground of their charge was that S. had attributed falsehood to God. Commenting in a thesis on the conduct of Samuel (1 Sam. chap. xvi.) when about to proceed to Bethlehem to anoint David, S. had pointed out that God certainly induced the prophet to adopt such measures and such language as could not but lead King Saul to believe what was not true. He argued, however, that the 'will of God' can never command what is criminal or wrong, and that this deception—this falsehood, as men would call it—was quite innocent and permissible. S.'s logic is not perhaps quite faultless, but he at least deserves credit for not denying the existence of a moral difficulty. The dispute was carried to the synod of Hague, and S. was subjected to a series of petty persecutions that shortened his days. He died at the Hague in 1730. As a preacher, S. has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety of religious sentiment. His chief productions are: *Sermons sur divers Textes de l'Ecriture Sainte* (La Haye, 1708—1725); *Nouveaux Sermons sur la Passion* (Rotterdam, 1732); *Discours sur les Evénements les plus mémorables du V. et du N. T.* (Amst. 1720—1728); *Abrégé de la Théologie et de la Morale Chrétiennes en Forme de Catéchisme* (Amst. 1722); and *Etat du Christianisme en France* (La Haye, 1725).

SAU'ROID FISHES, a name sometimes employed to designate fishes which approach in their structure to saurian reptiles. Of recent S. F., examples are found in Bony Pikes (q. v.) and Sturgeons (q. v.). Fossil S. F. are numerous, some of them of very large size. The teeth of *Megalichthys* are nearly four inches in length, far exceeding those of any existing fish and bony plates of the same fish have been found five inches in diameter.

SAU'RY PIKE (*Scomberesox*), a genus of fishes of the order *Pharyngognathi* and family *Scomberesocidæ*, having the body greatly elongated, and covered with minute scales; the head also much elongated, and the jaws produced into a long sharp beak, as in the Garfish (q. v.); from which, however, the present genus differs



Saury Pike (*Scomberesox saurus*).

in the division of the dorsal and anal fins into finlets, as in mackerels. One species (*S. saurus*) is common on the British coasts. It is about fifteen inches long, the back dark-blue, the under parts white; the fins dusky-brown. It approaches the coast, and enters firths in shoals, which are pursued by larger fishes, porpoises, &c.; and in order to escape from these, the S. P. often leaps out of the water, or rushes along the surface, for a distance of one hundred feet, scarcely dipping or seeming to touch the water. Hence the name SKIPPER, which it very commonly receives on the British coasts. Vast shoals sometimes enter bays, so that they may be taken by pailfuls, and great numbers are sometimes found among the sludge at the ebbing of the tide, in the upper parts of the Firth of Forth and elsewhere. The flesh of the S. P. is palatable.

SAU'SAGE, a well-known preparation of the flesh of various animals for culinary purposes. It is made by chopping the raw meat very fine, adding salt and other flavoring materials, and often bread-crumbs also, the whole forming a pasty mass. This is pressed into portions of the intestines of the animal, previously thoroughly cleaned and properly prepared. Usually, a considerable length of the intestine is filled and divided into separate sausages, by constricting it with pieces of string, at short intervals. The sausages of Lucania were very celebrated amongst the Romans. They were made of fresh pork, and bacon chopped fine, with nuts of the stone-pine, and flavored with cumin seed, pepper, bay-leaves, various pot-herbs, and the sauce called garum. Italy

is still celebrated for its Bologna sausages, and with many people the smoked sausages of Germany are highly prized; but except when quite fresh, sausages cannot be recommended as wholesome food.

SAUSAGE-POISON. It is well known that sausages made or kept under certain unknown conditions are occasionally highly poisonous; and in Germany, where sausages form a staple article of diet, fatal cases of sausage-poisoning are by no means rare. The symptoms are slow in appearing, three or four days sometimes elapsing before they manifest themselves. The poison may be described as of the narcotico-irritant character, and is very dangerous. Dr. Taylor, in his *Medical Jurisprudence*, records the cases of three persons who died from the effects of liver-sausages which had been made from an apparently healthy pig, slaughtered only the week before. The inspection threw no light on the cause of death. This case differs from those commonly occurring in Germany in this respect, that here the sausages were fresh, while the sausages which have proved poisonous in Germany had always been made a long time. Dr. Kerner, a German physician, who has specially studied this subject, believes that the poison is an acid formed in consequence of a modified process of putrefaction; others regard it as an empyreumatic oil.

SAUSSURE, Horace Benedict de, a celebrated Swiss physicist and geologist, was born at Conches, near Geneva, 17th February 1740. His education was attended to with such success that, in 1762, young S. obtained the chair of Physics and Philosophy in the university of Geneva. In 1768, he commenced the famous series of journeys which were fraught with such important consequences to science and to his own reputation; and during the course of which he visited the Jura and Vosges Mountains, those of Germany, England, Italy, Switzerland, Sicily, and the adjacent isles; the extinct craters of Auvergne, &c,; and traversed the Alps no less than 14 times, crossing them by 8 different routes. He was the first 'traveler' who ever ascended to the summit of Mont Blanc; he camped for 17 days on the Col du Géant, and finished his Alpine achievements by the ascent of Monte Rosa in 1789. During this extensive course of travel, he made numerous observations on the minerals, physical features, botany, and meteorology of the mountain ranges he visited; and these observations were found, after having undergone a searching examination, to be as correct and valuable as they were numerous. In short, they put the science of geology for the first time on a basis of fact. The work in which they are found is entitled *Voyages dans les Alpes*, &c. (Neufchatel, Geneva, Paris, 1779—1796, 4 vols.), and is much admired for its accurate and splendid descriptions of Alpine scenery. His observations were not made without considerable preliminary labor, for he found it necessary to improve his thermometer, hygrometer, eudiometer, electrometer, anemometor, and to invent other two instruments—viz., the cyanometer and diaphanometer, before his investigations, which were conducted with much care and candor, produced satisfactory results.

In 1786, S. resigned his chair; and in 1798 was appointed Professor of Natural History in the Central School of the *department of Leman* (formed on the annexation of Geneva to France); but four years afterwards, he was struck with paralysis, and after a long period of suffering, died at Geneva, 22d January 1799. Besides the great work above mentioned, he wrote numerous others, the chief of which are : *Observations sur l'écorce des Feuilles et des Pétales* (1762); *De Præcipuis Errorum nostrorum Causis, ex Mentis Facultatibus Oriundis* (1762); *De Electricitate* (1766); *De Aqua* (1771); *Sur l'hygrometrie* (1783), which, according to Cuvier, is one of the most important contributions to science in the 18th c.; and in which S. set forth his discovery of the dilatation in bulk, and diminution in specific gravity, of air charged with moisture. His 'Description of the Alps,' a portion of his great work, was published separately in 1834, at Geneva and Paris.

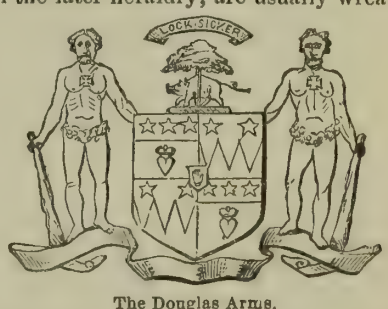
SAUTRANTIKA is the name of the second of the four great schools or systems of Buddhism, the three others being called *Vaibhâshika, Madhyamika*, and *Yogâchâra*. They recognize the authority of the *Sûtras* (q. v.), but reject that of the Abhidharma. —see C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

SAVAGE, Richard, an English poet, was born in London on 16th January 1696—1697. He was the fruit of an illicit intercourse between Lord Rivers and the Countess of Macclesfield, which resulted in the divorce of the lady, and the declared illegitimacy of her offspring. Lord Rivers, though permitting his name to be given to the child, seems not to have concerned himself further with him at all; and at the hands of his mother he met with only the grossest neglect. To the interference of *her* mother, Lady Mason, he was indebted for his education, received at the grammar-school of St. Albans. Afterwards, he was apprenticed to a shoemaker in Holborn, but an accident revealing to him the secret of his birth, he quitted this obscure handicraft. Repeatedly and in vain he appealed to the tender sympathies of his mother, who declined even to see him, and withheld all acknowledgment and assistance. Failing other means of subsistence, he turned his attention to literature, and at an early age produced several comedies, which met with but little success. Somewhat more fortunate was his tragedy of *Sir Thomas Overbury*, which, though indifferently received on the stage, with the author himself as actor of the leading part, obtained in print some approval, and put a little money in his purse. In 1727, he killed a man in a drunken tavern brawl—an offence for which he was tried, and sentenced to death. A pardon was, however, obtained for him on the intercession of the Countess of Hertford with the queen, and the details of his story becoming widely known, a strong feeling arose in his favor. Though his mother continued inexorable, and would, it was thought, have been well pleased to be rid of him by the hands of the hangman, certain of her relations interested themselves in him, and he was received into the household of Lord Tyrconnel, who allowed him £200 a year, and otherwise treated him with considerate generosity. His poem, *The Wanderer*, was now published; its success was great, and for a time the career of Savage was prosperous, and even brilliant. But it did not very long remain so. The inveterate irregularity of his habits involved him in difficulties with Lord Tyrconnel, and they parted with mutual recriminations. After this, he sunk irretrievably.

Though he failed in an attempt to obtain the post of poet-laureate, a poem which he wrote to commemorate her birthday so pleased the queen, that along with 'a permission to write annually on the same subject,' she conferred on him a pension of £50 a year. This sum, which might have been to him the basis of a modest subsistence, it was his regular habit to dissipate in a week's debauchery, passing the rest of his year in what disreputable fashion he could. On the failure of his pension by the death of the queen, a subscription was set on foot, mainly through the influence of Pope, with the view of sending him to live quietly at Swansea in Wales. Thither, accordingly, he retired; but happening to visit Bristol, where he lived in the reckless manner habitual to him, he was arrested for a debt of £8, and died in prison there, on the 31st July 1743.

The poetry of S., though a few vigorous lines of it continue to be remembered, is scarcely such as of itself would have sufficed for a permanent reputation. His most powerful and finished piece is *The Bastard*, in which, when he had finally broken with the relations of his mother, he held her up to public execration. Such celebrity as still attends his name he owes, however, almost entirely to the masterly life of him by Dr. Johnson, who, in the time of his own early struggles, was thrown much into his society.

SA'VAGES, or WILD MEN, in Heraldry, are of frequent occurrence as supporters. They are represented naked, and also, particularly in the later heraldry, are usually wreathed about the



The Douglas Arms.

head and middle with laurel, and often furnished with a club in the exterior hand. Savages are especially prevalent in the heraldry of Scotland. In more than one of the Douglas seals of the first half of the 15th c., the shield is borne in one hand by a single savage, who acts as sole supporter.

SAVA'NNAH, a city and port of Georgia, U. S., on the right bank of the Savannah River, 18 miles from its mouth, 90 miles south-west of Charleston, lat 32° 5′ N., long. 81° 5′ W. It is built on a sandy plain, 40 feet above the river, with broad streets shaded by beautiful trees. Its chief edifices are the custom-house, city exchange, court-house, state arsenal, theater, St. Andrew's Hall, Oglethorpe Hall, market, hospitals, and asylums. In 1874, the exports valued 50,500,000 dollars, consisting of cotton, rice, lumber, &c. The cotton exported in 1875 was 610,903 bales. Vessels of upwards of 14 feet draught discharge and load three miles below the harbor. S. is surrounded by marshes and islands, and on the river side is defended by Forts Pulaski and Jackson. It was founded in 1733 by the English general Oglethorpe. In 1776, a British fleet attempting to take the town, was repulsed after a severe action; but it was taken in 1778, and held in 1789 against the combined French and American forces. In the war of Secession.

after many unsuccessful attacks by sea, it was taken by General Sherman in February 1865. Pop. (1870) 28,235; (1880) 30,681.

SAVANNAH, a river which forms the boundary between Georgia and South Carolina, U.S., rises in the Alleghanies, on the south-western border of North Carolina, and flows south-east to the Atlantic. Its length is 300 miles, navigable to Augusta.

SAVANNAHS (Span. *savana* or *sabana*), the name given by the early Spanish settlers to the great plains or prairies (q. v.) of the North American continent.

SAVARY, ANNE JEAN MARIE RENÉ, Duc de Rovigo, a French general and diplomatist, was born at Marcq, in Ardennes, 26th April 1774, entered the army as a volunteer in 1790, and served with distinction in the army of the Rhine. In 1797, he accompanied Desaix to Egypt as *chef d'escadron*, and remained under his command as long as that general lived. After the battle of Marengo (1800), Napoleon made him his aid-de-camp, and for several years employed him only in political affairs, for which he showed an admirable capacity. In 1803, he was made general of brigade; in 1804, as commandant of the troops stationed at Vincennes, he presided at the execution of the Duc d'Enghien, an event which he is believed to have unduly hastened; and in the Prusso-Russian Austrian wars of 1806—1808, he acquired high military reputation, his victory at Ostrolenka (February 16, 1807) being really a brilliant achievement. Created Duke of Rovigo in the beginning of the following year, he was sent to Spain by the emperor, and negotiated the perfidious arrangement by which the Spanish king and his son were kidnapped. In 1810, he replaced Fouché as Minister of Police. After the fall of Napoleon, to whom he had always been passionately, and, we may add, unscrupulously devoted, he wished to accompany him to St. Helena; but he was confined by the British government at Malta for seven months, when he succeeded in making his escape, and getting on board a ship, was landed at Smyrna.

After experiencing several vicissitudes, he returned to Paris in 1818, and was reinstated in his titles and honors. In 1823, he removed to Rome; but at the close of 1831, he was appointed commander-in-chief of the army of Africa, and during his brief administration of affairs in Algeria, exhibited a splendid energy and generalship. But ill-health forced him to withdraw to France in March 1833, and on the 2d of June following, he died at Paris. S.'s *Mémoires* (Par. 8 vols. 1828) are among the most curious and instructive documents relating to the period of the Empire.

SAVE, a river of the south of Austria, and an important affluent of the Danube, is formed by two upper waters, which rise in the extreme north-west of Carniola, and unite at Radmannsdorf 1560 feet above sea-level. The river then flows south-east through Carniola, passing Laibach (at which point it becomes navigable), and forming in part the boundary between Carniola and Styria, after which it enters and traverses Croatia; and at its confluence with the Unna, first touches the Turkish dominions, the northern boundary of which it continues to form throughout the remainder of its course to its junction with the Danube at Belgrade. Estimated length, 500 miles. Its principal affluents are the Laibach (200 miles long), Kulpa, Unna, Bosna, and Drina.

SA'VELOY, a kind of sausage common in the London shops; it only differs from pork sausages in being made of young *salted* pork, highly seasoned, and having a little saltpetre added to give the contents a red color.

SAVIGLIA'NO, a fortified town of N. Italy, province of Cuneo, 9 miles east of Saluzzo. It is situated on the Maira and the Grana, and is a handsome and clean town. Cloth and silk are extensively manufactured, and the country in the vicinity is productive in wines and grain. Cattle are reared in great numbers, and silk-worms are bred largely. Pop. of town (1871), 9544; of commune, 16,150.

SAVIGNY, FRIEDRICH KARL VON, an illustrious writer on Roman jurisprudence, descended from a French Calvinistic family, that had emigrated to Germany in 1622, to avoid religious persecution, was born at Frankfurt on the 21st February 1779. He studied at Marburg, and took his degree in 1800, after which he commenced a series of lectures on juridical subjects, which were attended by a numerous auditory. Struck, in his exposition of the Digest, with the divergence existing between the text and the commentaries on the theory of possession, he composed in 1803 his masterly treatise, *Das Recht des Besitzes*, in which the Roman law is disengaged from the extraneous elements introduced into it by Germanic law, common usage, and the misapprehensions of commentators. Its merit was quickly recognized, and S. received the most advantageous offers from different universities, which, however, he declined, in order to prosecute researches in the libraries of France and Germany, with a view to a historical development of the glosses of commentators. He was assisted in this laborious undertaking by his pupil, Jakob Grimm, and his young wife, a daughter of the poet Clem. Brentano, and Bettina von Arnim. Appointed Professor of Law at Landshut in 1808, he was called, two years afterwards, to Berlin, on the reorganization of the university, and there he continued to lecture with unbroken success for a period of 32 years, in the course of which he filled various important offices in the university and the state, and died 25th October 1861, at the age of 82.

S. is the virtual founder of the new historical school of writers upon jurisprudence, although it is but fair to admit that Hugo and Schlosser had preceded him in the same direction. The essential idea of this school is, that 'law' or 'right' is not an abstract and absolute rule, manifesting itself under the same forms in all countries, but that it is one of the forces of society, with which it changes, according to fixed laws of development that are beyond the caprices of the day. This idea, when worked out historically, has produced the most important and original results, and may even be said without exaggeration to have regenerated the science of jurisprudence. S.'s principal writings are: *Vom Berufe unserer Zeit für Gesetzgebung und Rechtswissenschaft* (Heidelb. 1815); *Geschichte des Römischen Rechts im Mittelalter* (6 vols. Heidelb. (1826—1831); *System des heutigen Römischen Rechts* 8 vols. Berl. 1840—1848); *Das Obligationenrecht* (1851—1853), and *Vermischte Schriften* (5 vols. Berl. 1850), a collection of essays which had originally appeared in the *Zeitschrift für Historische Rechtswissenschaft*, and elsewhere.

SA'VINE (*Juniperus Sabina*, see JUNIPER), a low, much-branched, and very widely-spreading shrub, with very small, imbricated, evergreen leaves, which grows on mountains in the south of Europe and the east. It bears small black berries, covered with a pale blue bloom. Its foliage has a strong, fetid, aromatic, penetrating odor, particularly when rubbed. Its exhalations cause headache. The part of the plant used in medicine is the tops of the branches, collected in spring, and dried. Their odor is strong, peculiar, and unpleasant, and their taste acrid, bitter, resinous, and disagreeable. The therapeutic properties of S. are due to the volatile oil which it contains. Two pounds of the tops yield about five ounces of this oil, which is limpid and nearly colorless, having the odor of the plant, and a hot acrid taste. Its composition is $C_{10}H_8$, being isomeric with oil of turpentine.

S. exerts a stimulating effect on the uterine organs, and is employed with much benefit in cases of amenorrhœa and chlorosis, depending upon want of tone in those parts. It is best given in the form of the oil, one or two minims of which may be prescribed in a pill, to be taken twice a day. This drug is often employed by the lower classes for the purpose of procuring abortion; but it ought to be generally known that if it is given in a sufficiently large dose to produce the desired effect, the life of the mother is placed in the greatest possible peril. If a poisonous dose has been given for this or any other object, emetics should first be employed to remove any of the drug that may remain in the stomach, after which opiates and demulcents should be prescribed, and a general cooling and lowering treatment adopted. S. in the form of ointment is much used as an external application, with the view of keeping up the discharge from a blistered surface. The ointment cannot, however, be kept long without losing its properties.

SAVINGS-BANKS. The application of the banking-system to the middle and humbler classes of society was commenced by individual exertions long before the legislature took cognizance of the matter. In 1799, the Rev. J. Smith, rector of Wendover in Bucks, as a means of inducing habits of prudence and frugality among his parishioners, offered, with two other inhabitants, to receive weekly any sum not less than twopence; and if the amount were not touched before the next following Christmas, to add one-third to it as a bonus or encouragement. In 1810, the Rev. H. Duncan established a Parish Bank Friendly Society at Ruthwell (Scotland), more resembling a modern savings-bank. A minute account of its organization and mode of operation drew so much attention to it, that, by the year 1817, there were 78 establishments resembling it in the United Kingdom.

The first savings-banks acts were passed in 1817, one for England and Wales, and one for Ireland. A fund, called the Fund for the Banks for Savings, was opened with the National Debt Commissioners; and into this fund were to be placed all savings-banks deposits as soon as they reached £50. On these sums the National Debt Commissioners gave £4, 11*s*. 3*d*. per cent. interest (3*d*. per cent. per diem). The managers of the savings-banks in most cases allowed the depositors 4 per cent., the difference being applied to the working expenses.

This, the fundamental statute on the subject, has been modified and extended in many ways since. In 1824, as it was found that the benefits of the savings-banks system were reaped by persons for whom it was not intended, an act was passed declaring that the deposits in the first year should not exceed £50; that those in subsequent years should not exceed £30; that no interest would be allowed on any excess beyond £200; and that no person would be allowed to make deposits at more than one savings-bank. In

1828, an act was passed to give greater security to the depositors. The rules drawn up by the trustees and managers of all savings-banks were to be submitted to a barrister appointed by the National Debt Commissioners, and without his approval no savings-bank could commence or continue operations. The justices of the peace had also a veto in the matter; and the clerk of the peace was to keep a certified copy of the approved rules and regulations. The trustees were to receive £3, 16*s.* 0½*d.* per cent. interest (2½*d.* per cent. per diem), and were to pay the depositors not exceeding £3, 8*s.* 5½*d.* interest (2½*d.* per cent. per diem). No depositor was to deposit more than £150; but compound interest might accumulate until the total reached £200. Friendly societies and charitable institutions were, however, permitted to invest to the amount of £300.

In 1833, an act was passed to enable savings-banks to manage the granting of small deferred annuities, to be paid for by weekly, monthly, quarterly, or yearly instalments. In 1835, another act extended the operation of the statutes of 1828 and 1833 to Scotland, and enabled existing savings-banks to conform to the stipulations without a necessity for reorganization.

In 1844, a new act made extensive changes in the savings-banks system, the chief items of which may thus be summarized: Interest allowed by the commissioners to trustees to be reduced to £3, 5*s.* 0*d.* per cent., and to depositors to £3, 0*s.* 10*d.* per cent. (2*d.* per diem); every depositor's book to be sent once a year to his savings-bank for examination; the extent of the liability of trustees, managers, actuaries, and cashiers exactly defined; arrangements for making deposits in trust for other persons; annuities under the act of 1833 not to exceed £30 for any one person, but separate annuities to that amount may be granted to a husband and wife; deposits made by a married woman may be returned to her, unless the husband give notice to the contrary; rules laid down concerning the inheritance of the deposits of intestate and illegitimate persons; payments to the relations of intestate depositors to be made to the next of kin according to the law of Scotland, if in that country. An act passed in 1848 placed a limit on the liability of trustees of savings-banks in Ireland. In 1853, an act placed the maximum and minimum of savings-banks annuities at £30 and £4 respectively; and allowed a husband and wife to purchase a joint annuity, although one of them may have already had an annuity of the full amount. Another act in 1860 authorized the National Debt Commissioners to invest the moneys received by them from savings-banks in any kind of stock, debenture, or other security that has received parliamentary sanction; and required them to make an annual return to parliament of all such transactions. The act of 1861, establishing Post-office savings-banks, contained provisions for the transfer of deposits from the one kind of savings-banks to the other. By another statute passed in 1863, the arrangements for deposits in the name of a minor are defined; the order of proceedings is settled whereby any savings-bank may be wound up and closed, and the claims of the depositors transferred to the Post-office savings-banks. Two more recent statutes will be noticed in the concluding paragraphs of this article.

From time to time, as the above-named statutes came into operation, the National Debt Commissioners have laid down rules for giving them practical effect, and the registrar of savings-banks has exercised the necessary supervision. The rules on the important subject of savings-banks annuities may be thus briefly noticed: The nominee's age must not be under 15; no annuity below £4, and the aggregate of annuities to any one person not to exceed £30; by purchasing two half-annuities instead of a whole one, the annuitant may receive his money in four quarterly sums; on the death of the annuitant, a sum equal to one-fourth part of the annuity will be paid to his or her next representative, if claimed within two years; if the purchaser of an annuity is unable to continue his instalment of payments, he may either receive back the whole of his money without interest, or may have an immediate or deferred annuity equivalent in amount to the moneys which he has paid; if the purchaser of a deferred life-annuity die before the annuity becomes due, the whole amount of his payments, but without interest, is paid to his family; an annuity is not transferable, except by a bankrupt to his creditors, from whom it will be purchased by the National Debt Commissioners at its proper value.

These institutions have wrought vast benefit, by inducing habits of economy among the working-classes. Let us compare two years thirty years apart, 1833 and 1863. On November 20, 1833, there were 484 savings-banks, holding balances belonging to 475,155 depositors; the sum in hand was £15,715,111, giving an average of more than £33 due and belonging to each depositor; these totals applied to England, Wales, and Ireland, but did not include Scotland. On November 20, 1863, there were savings-banks in the United Kingdom holding balances belonging to 1,555,089 individual depositors, charitable institutions, and friendly societies; the sum in hand (including interest) was £43,278,656, giving an average of about £28 due and belonging to each depositor. The charitable institutions and friendly societies which had accounts open with savings-banks were so large in number as 28,334, having deposits of about £100 each on an average. About 300,000 depositors had accounts open of less than £5 each. There were 6627 savings-banks annuities then in force, for an aggregate sum of £135,748 per annum; in other words, the annuities were more than £20 each on an average.

Just before the new Post-office savings-banks came into operation, there were 1,609,103 depositors in the old savings-banks; this number increased to 1,887,510 by March 31, 1864—showing that the new system has been a positive benefit to the old. In subsequent years, many of the old or trustee banks arranged for a transfer to the Postmaster-general. The report issued in 1879 tells us of 1,506,714 accounts open with the old banks, on which was due to depositors the aggregate sum of £43,797,804; the number of savings-banks under trustees at that date was 449. The different sections of the United Kingdom had contributed to the aggregate amount in the following proportions in 1878:

England and Wales	£35.324,689
Scotland	6.178.534
Ireland	2,219,596
Channel Islands	533.069
	£44,255,890

It would appear that the Post-office savings-banks are suitable for smaller deposits than the others, judging from the sums deposited since the two systems have been in operation together. That the changes have been in the increase of the Post-office banks, rather than in the decline of the trustee banks, is satisfactorily shown by a comparison of the deposits in each in 1864 with those in 1874.

	1864.	1874.	Increase.
Post-office banks..	£4,993,124	£23,157,469	£18,164,345
Trustee banks....	35.145.567	41,505.949	6,360,382
	£40,138,691	£64,663,418	£24,524,727

a total increase of £24,524,727 in ten years.

POST-OFFICE SAVINGS-BANKS.—Mr. Sikes, of the Huddersfield Banking Company, in a paper read before the Congress on Social Science, held at Bradford in 1859, advocated the establishment of savings-banks in connection with the money-order department of the General Post-office. The subject had more or less occupied the attention of public men since 1806, when Mr. Whitbread made a proposition relating to it; but Mr. Sikes's plan was so clear and detailed, that the postmaster-general took the matter up. An act of parliament was obtained in 1861. The Postmaster-general is to act in concurrence with the Treasury and the National Debt Commissioners. Deposits not less than one shilling in amount may be made at any of the money-order offices or at such offices as the Postmaster-general may appoint. Each depositor is provided with a deposit-book; each deposit is entered in this book, and is attested by the receiving-officer, and by the dated stamp of his office. The amount received is reported on the same day to the Postmaster-general. An acknowledgment of each deposit is transmitted to the depositor, and this is to be conclusive evidence of his claim to repayment with interest. The depositor is entitled to repayment of the whole or any part of the deposit, on making a demand in a prescribed form at *any* of the offices (not necessarily the one at which he made his deposits) within ten days at furthest after sending in the demand. The names of the depositors, and the amounts paid in and returned, are not to be disclosed except to the officials immediately concerned. All the moneys are paid into and received back from the National Debt Office, on the authority of the Postmaster-general. Interest at 2½ per cent. is allowed on all deposits as soon as they amount to £1, but none on fractional parts of £1. Facilities are supplied by means of certificates for transferring deposit accounts from ordinary savings-banks to Post-office savings-banks, or *vice versâ*. All expenses are refunded to the Post-office out of the deposit fund; and if there should be any deficiency, the Consolidated Fund is to bear it.

A detailed account of the proceedings is to be presented annually to parliament. The maximum sum deposited by any one person in one year is limited to £30. By the act promoted by Mr. Henry Fawcett, Postmaster-general in 1880, the business done by these banks has been vastly increased. Deposits of one shilling in the shape of twelve penny stamps on an official form are now received. The rate of interest is £2, 10*s.* per cent. per annum. Investments in Government stock and the purchase of annuities are transacted in the same way as in the trustee banks. See *The Post-office* and *Aids to Trift*, by H. Fawcett, to be had gratis at any post-office.

This new system commenced on September 16, 1861; and at the end of 1875 the total sum deposited, with interest, was £81,397,000, and the sum withdrawn, £56,210,000. At the end of 1879 the number of P. O. savings-banks in the United Kingdom was

6016, and the amount of deposits for that year was £9,887,109, making an average of £2, 19*s*. 1*d*. per deposit. The number of withdrawals was 1,418,543, amounting to £9,030,174; average of each withdrawal, £6, 7*s*. 4*d*. The interest amounted to £743,636, and the charges of management to £192,280, being 12*s*. per cent. on the capital. The total amount at the credit of depositors at the end of the year was £32,689,001. The total amount at the end of 1878 was £30,411,563; the number of banks, 5831. The average amount at the credit of each depositor was £16, 1*s*. 4*d*. The proportion of depositors to population in 1878 was 1 to 17, thus distributed: 1 to 14 in England, 1 to 70 in Scotland, and 1 to 79 in Ireland. Large numbers of provident and charitable societies, &c., deposit their funds in the Post-office savings-banks.

MILITARY AND NAVAL SAVINGS-BANKS.—In 1842, an act was passed for establishing military savings-banks in connection with the regimental pay departments. Another act was passed in 1859, affording greater facilities to the frugal soldier. The proceedings of these banks in the following years, present the following figures:

	Deposits in Year.	Withdrawals in Year.
1859	£70.736	£64.497
1860	163,491	116,393
1861	167,136	149,090
1879–80	224,814	238,302

The figures have fluctuated through causes not stated in the parliamentary returns, being about the same in 1871 as in 1861, after being much lower in some of the intervening years, and much higher in 1866. The number of accounts open in the latest years was 17,054, including those of many army charitable funds.

Concerning seamen's savings-banks, they mainly depend for their provisions on an act passed in 1856, which recognized the shipping-offices for seamen as branch savings-banks; and authorized the Board of Trade to lay down rules with respect to the persons entitled to become depositors, the making and withdrawal of deposits, &c. The operations of the seamen's savings-banks are far less extensive in amount than those of the military savings-banks. The deposits in the year 1879–80 were £96,052, and the withdrawals £116,669; number of accounts open, 10.979; the total investment is steadily growing, and with it the total interest receivable.

A few changes have been made by the legislature, some of which have tended to widen the area of their operations. An act was passed in 1866 (29 Vict. c. 5), authorizing the investment of a stated amount of savings-banks money in terminable annuities. It applied alike to trustee savings-banks and to Post-office savings-banks; and was supplemented by another act in 1869 (32 and 33 Vict. c. 59). By the act of 1880 (43 and 44 Vict. c. 36), while the rate of interest was reduced to £2, 15*s* per cent. per annum, facilities were given for the purchase of Government stock at current rates; the smallest amount for one investment being £10, and the largest not more than £100, per annum. It need hardly be said that this new feature has been largely taken advantage of.

AMERICAN SAVINGS-BANKS.—In the report for 1879–80, the Comptroller of the United States Currency states the total deposits in United States savings-banks at over £163,000,000, owned by 2,335,582 depositors; while the number of banks was about 660.

SAVO'NA, a maritime city of Northern Italy, in the province of Genoa, and 25 miles south-west of the city of that name. It is situated on a plain near the sea, and has numerous manufactures, including extensive potteries. The neighborhood produces olives, fruits, grain, wood, and wines. It carries on a brisk trade with Marseille. The harbor, one of the safest in the Mediterranean, was 25 to 30 feet deep, till the Genoese in the 16th c. filled it with stones; but since the opening of the Mont Cenis tunnel, which promises to increase the commerce of S., steps have been taken to have it cleared out. Pop. (1872) 19,664. The city is the third in importance on the Riviera. It is a very ancient city, and in the time of the Romans was called Sava, founded, according to tradition, by Janus. It flourished under the Roman empire, was destroyed by Rotharis (639), was rebuilt by Ludovic the Pious (981), and was afterwards laid waste by the Saracens.

SAVONAROLA, JEROME, the celebrated preacher and political as well as religious reformer of Florence, was born of a noble family at Ferrara, September 21, 1452. He was educated at home, and, at a very early age, became deeply versed both in the philosophy of the schools and in the old Greek philosophy, which at that time had become popular in Italy; but his disposition from the first was strongly tinged with religious asceticism, and, in 1474, he formally withdrew from secular affairs, and entered the Dominican order at Bologna. Having completed his novitiate, and the studies of the order, his first public appearance as a preacher seems to have been in 1482, at Florence, where he had entered the celebrated convent of his order, San Marco, and where he preached the Lent in that year. His first trial, however, was a signal failure. His voice was harsh and unmusical, and he so utterly failed to interest his hearers, that, after a time, the course of lectures was entirely deserted. Some time afterwards, S. was sent to a convent of his order at Brescia, where, by degrees, his earnestness and zeal began to attract notice, and eventually, the disadvantages of manner and address, which had told against the effect of his early efforts, either were overcome through practice, or ceased to be felt under the influence of his sterling genius and irresistible enthusiasm. In 1489, he was once more recalled to the convent of San Marco at Florence. His second appearance in the pulpit of San Marco was a complete success. The great subject of his declamation was the sinfulness and apostacy of the time; and in his denunciation of the vices and crimes of his age, he took as his theme what has been the topic of enthusiasts in almost every age, the mystical visions of the Apocalypse, which he applied with terrible directness to the actual evils with which, as with a moral deluge, the age was inundated; and in these half-expositions, half-prophetical outpourings, his followers claimed for him the character of an inspired prophet.

Under the rule of the great founder of the family of the Medici, Lorenzo the Magnificent, art, literature, and philosophy had all followed the common direction of that elegant but semi-pagan revival, which the scholars of the 15th c. had inaugurated; and the whole spirit of the social as well as intellectual movement of which Florence, under the Medici, was the center, was utterly at variance with the lofty Christian spirituality and severe asceticism in which S. placed the very first conditions of the restoration of true religion and morality. His preaching, therefore, in its spirit, as well as in its direct allusions, was no less antagonistic to the established system of the government, than to the worldly and irreligious manners of the age; the visions and predictions ascribed to him had quite as much of political applicability as of religious significance; and thus, to the aristocratic adherents of the Medici, S. early became an object of suspicion, if not of antipathy and dread. It is said by Pico de Mirandola, that he refused to grant absolution to Lorenzo, when the latter lay dying in 1492; but the statement does not accord with Poliziano's account of his patron's death. Through all this time, however, S.'s relations with the church were, if not of harmony, at least not of antagonism; and when, in the year 1493, a reform of the Dominican order in Tuscany was proposed under his auspices, it was approved by the pope, and S. was named the first general vicar. About this time, however, his preaching had assumed a directly political character, and the predictions and denunciations which formed the staple of his discourses, pointed plainly to a political revolution in Florence and in Italy, as the divinely ordained means for the regeneration of religion and morality. In one of his discourses, he pointed plainly to the advent of the French under Charles VIII.; and when this prediction was fulfilled by the triumphant appearance of the French expedition, S. was one of a deputation of Florentines to welcome Charles VIII. as the savior of Italy, and to invite him to Florence.

Very soon, however, the French were compelled to leave Florence, and a republic was established, of which S. became, although without political functions, the guiding and animating spirit, his party, who were popularly called *Piagnoni*, or 'Weepers,' from the penitential character which they professed, being completely in the ascendant. It was during this brief tenure of influence that S. displayed to the fullest extent, both the extraordinary powers of his genius, and the full extravagance of the theories to which his enthusiastic asceticism impelled him. The republic of Florence was to be the model of a Christian commonwealth, of which God Himself was the chief ruler, and His Gospel the sovereign law; and thus the most stringent enactments were made for the repression of vice, and of all the sinful follies by which it is fomented and maintained. All the haunts of debauchery were suppressed; gambling in all its forms was prohibited; the vanities of dress were restrained by sumptuary enactments; and, under the impulse of the popular enthusiasm which the enthusiasm of the prophet engendered, women flocked in troops to the public square to fling down their costliest ornaments; and gay gallants and grave scholars destroyed, in one common *auto da fé* before the gates of the cathedral, whole hecatombs of the amatory poetry or licentious fiction of the day, in conjunction with the elegant paganism or unconcealed immorality of the classic period. Meanwhile, the extremes of his rigorism; the violence of his denunciations, which did not spare even the pope himself; the assumption by him, or attribution to him, of a supernatural gift of prophecy; and the extravagant interpretation of the Scripture, and especially of the Apocalypse, by which he sought to maintain his views, drew upon him the displeasure of Rome. He was cited, in the year 1495, to answer a charge of heresy at Rome; and on his failing to appear, he was forbidden to preach; the brief by which the Florentine branch of his order had been made independent, was revoked; and he was again summoned to Rome. Once again

S. disregarded this order. But his domestic difficulties now began to deepen. The measures of the new republic proved impracticable.

The party of the Medici, called 'Arrabbiati' (Enraged), began to recover ground. A conspiracy for the recall of the exiled House was formed; and although, for the time, it failed of success, and six of the conspirators were condemned and executed, yet this very rigor served to hasten the reaction. The execution of these conspirators was a direct violation of one of S.'s own laws, and it tended to direct the popular sympathy in their favor. At the critical point of the struggle of parties came, in 1497, a sentence of excommunication from Rome against Savonarola. S. openly declared the censure invalid, because unjust, and refused to hold himself bound by it. In the following year, however, 1498, when the new elections took place, the party opposed to S., the Arrabbiati, came into power. He was ordered to desist from preaching; and the struggle was brought to a crisis by the counter denunciations of a preacher of the Franciscan order, long an antagonist of S., Francesco da Puglia. In the excited state of the popular mind thus produced, an appeal was made by both of the contending parties to the interposition of divine providence by the ordeal of fire. But at the moment when the trial was to have come off, difficulties were originated by the party of S., and nothing was actually done. The result of this was to destroy, with the populace, the prestige of S.'s reputation, and to produce a complete revulsion of public feeling. In the midst of this reaction, he was cited before the council, and brought to trial for misleading the people by false prophecies. He denied the charge; but being threatened with torture, he is said to have made a confession, which, however, his friends say was garbled, if not utterly falsified. He was declared guilty of heresy and of seditious teaching. The acts of the trial were sent to Rome, where the sentence was confirmed; and he, with two others of his order, were given up to the secular power.

An effort was made to procure a remission of the capital sentence which was passed upon them, but in vain; and on May 23, 1498, this extraordinary man, with his two companions, F. Domenico da Pescia and Silvestro Maruffi, were executed and their bodies burned by the executioner. They died professing their adherence to the Catholic Church, and humbly accepting the last absolution from the papal commissary; and it is still a question among Catholics, whether S. is to be regarded in the light of a confessor of the truth, or of a fanatical forerunner of the movement which so soon reached its full development in the Reformation. The works of S. are very numerous. They were all written either in Latin or in Italian, but have for the most part been translated into French, German, Spanish, and other languages. His works in Latin are: (1.) *On the Simplicity of the Human Soul;* (2.) *The Triumph of the Cross;* (3.) *A Dialogue of the Spirit and the Soul;* (4.) *A Fourfold Exposition of the Lord's Prayer;* (5.) *On the Perfection of the Spiritual Life.* Most of them were translated contemporaneously into Italian, and some even by S. himself. His principal Italian works are: *A Treatise on Humility, On the Love of Jesus Christ, On the State of Widowhood, Two Treatises on Prayer, Rules of Christian Living* (together with a work of a title almost the same which he wrote while in prison, and at the desire of his jailor), *On the Mysteries of the Mass,* and several other doctrinal and ascetical treatises. No collected edition of his sermons has been published, and his correspondence also has, for the most part, disappeared; but the works which survive sufficiently illustrate the peculiarities of his genius, and the stern and almost fierce enthusiasm which was the secret of his influence on that corrupted but yet cultivated age.—See Madden's *Life of Savonarola* (2 vols. 8vo, 1854); Abbé Carle's *Historie de S.* (Paris, 1842); and especially Villari's *Storia di S.* (Flor. 1859—1861). See also Mrs. Oliphant's *Makers of Florence* (1877).

SAVONE'TTES, soap of fine quality, perfumed and made into balls or other shapes, for use at the toilet.

SA'VORY (*Satureja*), a genus of plants of the natural order *Labiatæ*, nearly allied to Thyme (*Thymus*), and differing from it in the regularly 5-toothed or 5-cleft calyx, and the stamens bent together into an arch under the upper lip of the corolla. The species are herbaceous and half-shrubby plants, all natives of the South of Europe and the East. They have narrow, linear-lanceolate, entire leaves, with resinous dots, and short, axillary, little corycombs. The COMMON S., or SUMMER S. (*S. hortensis*), is commonly cultivated in kitchen-gardens for flavoring dishes. It is an annual plant, ½—1 foot high, with leaves not prickly pointed, and lilac or white flowers; has a strong and agreeable aromatic smell, and an aromatic pungent taste, and is in common use both fresh and dried for flavoring dishes, and especially for flavoring beans. It is stomachic and tonic.—WINTER S. (*S. montana*) is used exactly in the same way. It is a half shrubby plant, with thickly-pointed leaves and larger flowers. Its taste is pungently aromatic.—Summer S. is propagated by seed; winter S. by slips and cuttings.

SAVOY, a cultivated variety of CABBAGE (q. v.), forming a large close head like the true cabbages, but having wrinkled leaves. A number of sub-varieties are in cultivation. The mode of cultivation and the uses are the same as those of cabbage. Savoys are much cultivated for winter use; they require a light rich soil.

SAVOY, formerly a duchy belonging to the kingdom of Sardinia (q. v.), now incorporated with France, is bounded on the N. and E. by Switzerland, E. and S. by Piedmont, and W. by the French departments of Isère and Ain. While an Italian duchy, it was politically divided into seven provinces, a division which exhibited the successive steps of its acquisition by the House of Savoy; but since its annexation to France, this division has been modified, though the change has been little more than nominal. It is now separated into two departments: first, SAVOIE, or CHAMBÉRY, the southern part of S., with an area of 2220 sq. m., and a pop. of (1876) 268,361, which is divided into four arrondissements—Chambéry (old province of *Chambéry*), Albertville (*Alta-Savoia*), Moutiers (*Tarantasia*), and Saint Jean de Maurienne (*Maurienne*)—and has Chambéry for its capital; secondly, HAUTE-SAVOIE, or CONFLANS, the northern part of S., which has an area of 1660 sq. m., with a pop. of 273,801, and is divided into four arrondissements—Bonneville (*Fossigni* or *Faucigny*), Thonon (*Ciablese* or *Chablais*), Annecy and St. Julien (*Genevese*)—Annecy being the capital. The two departments resemble each other so much in all respects, that they may be described together.

S. is the most elevated tract in Europe, and is mostly covered with mountains, which break up the country into a number of valleys, each watered by its own snow-fed torrent or stream. The highest elevation of S. is the summit of Mont Blanc (q. v.), and the lowest is the bank of the Rhone at Saint-Genix d'Aosta, 670 feet above sea-level. The Graian Alps run along the eastern boundary of S., and form a natural barrier between it and Piedmont, several breaks or gorges affording means of communication between the two countries; from this range, the mountains gradually decrease in height towards the valley of the Rhone, which is on the western boundary.

S. (especially Haute-Savoie) is extremely picturesque, and within a comparatively limited space, exhibits at once the curious, the beautiful, the grand, and the wild and forbidding phases of natural scenery. There we have the lakes of Geneva, Annecy (9 miles by 1½), Aiguebellette, each perfect in its own style of beauty; the subterranean lakes of Bauge, the cascades of Sallanches and Bout-du-monde, the intermittent springs of Pigros and Haute-Combe, the grottoes of Balme, Bauge, and Sallanches, the hot springs of Aix-le-bains (near Chamberry), of Saint Gervais, Bride, Echaillon, and others; the smiling valleys of Chamberry, Faverage, Maglan, and Albertville; the glaciers of Chamounix, Buet, and Upper Tarantasia; the wooded mountain-sides of Ciablese, the bare rugged peaks which surround Mont Blanc, the frowning gorge of Challes, and the wild and savage glens and dells of Maurienne. Tourists consequently flock in great numbers to S., the robust to gratify their love of sight-seeing, and the invalids to benefit by the thermal springs, which are much esteemed.

The whole of the country is drained by streams which flow either into Lake Leman (the northern boundary) or the Rhone. Chief of the former is the Drance, which traverses Chablais; among the latter are the Arve, which drains the Chamounix valley, the Usses, the Fier, the Laisse, the Guier, and the Isère. The geology of S. is marked by the presence of three distinct ranges, exhibiting respectively the primary, transition, and secondary series of rocks with great completeness; and the depth of the crevasses, the height of the mountains, inversions of strata, débris on the mountain-sides, afford excellent opportunities for a thorough study of the constitution and elements of the earth's crust.

The whole of S. is broken up into a multitude of small estates, and the country is, as a consequence, most carefully cultivated, some of the fertile valleys resembling a continuous garden abounding in flowers and fruits. The ground suitable for cultivation being very limited, the enterprising natives have made extraordinary efforts to increase it by constructing line above line of parapets along the steep mountain-sides, and by filling in earth behind, forming long and narrow terraces, on which, if they can succeed in growing two rows of vines, they consider themselves well rewarded for their labor. These terraces are most common in the hilly districts of Tarantasia and Maurienne.

The climate of S. is in general cold, the winters are long and severe, and the summers frequently follow without an intermediate spring. Yet S. can boast of the vegetation of warm countries, as well as of that of higher latitudes; the vine is found growing almost to the edges of the glaciers, and cereals and fruits of various sorts are produced in great perfection. The pasturage is rich and abundant, and mulberry trees are largely planted. Although it is essentially an agricultural country, the industrial arts

are not unrepresented; fabrics of cotton, printed calico and gauze, stockings, felt-hats, woollen cloth, are manufactured in various localities; and tanneries, breweries, distilleries, glass-works, potteries, &c., are occasionally met with. The chief occupation, however, is the breeding of cattle, horses, and mules, all of which are much esteemed, and fetch good prices; and bees and silk-worms are tended as a source both of amusement and profit.

S. is rich in minerals—silver, iron, copper, antimony, manganese, lead, zinc, asphalt, marble, granite, gypsum, sulphur, and salt. The principal mines are the spathic iron-mine of Saint Georges d'Hurtieres, and the lead-mine of Macot. Coal is found in Maurienne.

The exports consist of the surplusage of these products, and also of cheese, hemp, silk both raw and spun, and wood of various sorts. S. is, with the exception of Bavaria, the only country of Europe in which advanced education is given gratuitously, there being within the country 14 colleges for this purpose. Ordinary education is also well provided for, as more than 1200 schools exist, nearly the whole of which are supported on old foundations.

The Savoyards are honest, intelligent, religious, hospitable, and enthusiastically patriotic, even to a greater extent than the Swiss. More than 20,000 of them expatriate themselves annually for the purpose of pursuing various callings, but the greater portion return early in summer, while others wait till they have amassed wealth sufficient for the rest of their lives.

SAVOY, HOUSE OF. The small territory of Savoy, formed a part of ancient Gaul, and after the decline of the Roman power, was seized by the Burgundians (407 A.D.), and along with Burgundy, passed under the Franks (534). On the breaking up of the Frankish empire, Savoy was joined to *Transjurane Burgundy*, and along with that kingdom was united to *Cisjurane Burgundy*, or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II., the great lords of North-western Italy, such as the lords of Suza, Chablais, Maurienne, and Turin, became vassals direct of the empire. The counts of Maurienne, the ancestors of the House of S., are generally believed by most historians who have investigated their genealogy to have descended directly in the male line from a son of Wittekind the Great, the last independent king of the Saxons; and COUNT HUMBERT, *the White-handed*, was the first of the family who, by the addition of Chablais and Valais (grants from the Emperor Conrad the Salic) to his hereditary lordship of Maurienne, rose to high position among the princes of Northern Italy. One of his descendants, HUMBERT II. (1078—1103), succeeded to the marquisate of Suza (which included the greater part of Piedmont), and further increased his little territory by the conquest of Tarantasia. The family now commenced to form alliances with the royal Houses of France, Portugal England, Naples, Spain, and Germany, which added greatly to its political importance.

AMADEUS III. (1103—1149) received from the Emperor Henry V. the title of COUNT OF SAVOY (1111), and his grandson, THOMAS I. (1188—1233), obtained important accessions in Chambery, Turin, the country of Vaud, and many other lordships. Count Thomas was the initiator of the policy so long and successfully adopted by his successors, 'of preserving armed neutrality in all contests between France and the Empire, and of vigorously supporting the Empire against the papacy.' From this time, the counts of Savoy became the arbiters of all quarrels in North, and occasionally in South Italy, and their bravery in the field, and keen political sagacity,* increased at once their political influence and their territorial jurisdiction. After the death of Count Boniface in 1263, without heirs, his uncle PIETRO, the Earl of Richmond and lord of Essex, usurped the crown; but in 1285, the rightful heir, AMADEUS V. (1285—1323), the grandson of Pietro's elder brother, obtained the succession; and his grant to his brother THOMAS of the principality of Piedmont as a hereditary fief, founded the two lines of Savoy and Piedmont, which continued to rule over their respective territories till, on the latter becoming extinct in 1418, Piedmont reverted to the elder line. (See AMADEUS V., VI., and VIII.). Amadeus VIII. was the first DUKE OF SAVOY, being so created by the Emperor Sigismond in 1416. CHARLES I. (1482—1489) obtained from Charlotte of Lusignan, queen of Cyprus, the transference of her rights, and from this date (1485) the dukes of Savoy also claimed to be kings of Cyprus and Jerusalem.

The elder male line becoming extinct in 1496, the next collateral heirs were PHILIBERT II. (1496—1504) and Charles III. (1504—1553); but the latter, having sided with Charles V. against Francis I. of France, was deprived of the duchy of Savoy in 1533, the countries of Valais and Geneva placed themselves under the protection of Switzerland, and in 1536 the country of Vaud was seized by the people of Bern. But his son, PHILIBERT EMMANUEL, who was the Spanish governor in the Netherlands, succeeded, at the peace of Cateau-Cambresis (1559), in obtaining repossession of Savoy. It was this duke who attempted to convert the Vaudois (q. v.), and who founded the now important silk-production in Piedmont, besides, to the utmost of his power, encouraging the prosecution and development of other branches of industry. He re-annexed (1576) the principality of Oneille, and conquered the county of Tende. His successor, CHARLES EMMANUEL I. 1580—1630, was celebrated as a scholar, statesman, and warrior, but he was cursed with an inordinate ambition, which involved him in unfortunate contests with Geneva (a former town of Savoy, of which he wished to regain possession), with the French, who in revenge took possession of his dominions, and with the Spaniards. His two sons, VICTOR AMADEUS I. (q. v.) (1630—1637) and Thomas, were the respective founders of the two lines of Savoy and Savoy-Carignan. Victor Amadeus speedily regained the dominions which his father had lost; and with the consent of France, added to them Montferrat, Alba, and some other places, relinquishing Pignerol, La Perouse, Angrone, and Lucerne to the French. As generalissimo of the French army in Italy, he gained two victories over the Spaniards, but died soon after. His grandson, VICTOR AMADEUS II. (1675—1730), was one of the claimants for the Spanish throne on the extinction of the Spanish-Hapsburg dynasty (see SUCCESSION, WAR OF THE SPANISH); and by his adroit policy in the contest between the Hapsburgs and Bourbons for the possession of this crown, he succeeded in obtaining extensive additions to his little territory, the chief of these being Alessandria, Val-di-Sesia, and other portions of the Milanese, the island of Sicily in 1713, and along with this latter the title of king. He and his descendants were also recognized as the legitimate heirs of the Spanish throne, should the Bourbon dynasty ever become extinct. But in 1720 he was compelled to surrender Sicily to Austria, in exchange for the island of Sardinia, which, along with Savoy, Piedmont, and his other continental possessions, was then erected into the KINGDOM OF SARDINIA (q. v.).

SAVOY CONFERENCE, the name given to an ecclesiastical conference held in 1661 at the Savoy Palace (so called because built in 1245 by Peter, Earl of Savoy and Richmond [see AMADEUS]; burned by Wat Tyler in 1381, it was rebuilt and endowed in 1505 as an hospital for poor persons) between the Episcopalian and Presbyterian divines, with the view of ascertaining what concessions would satisfy the latter, and thereby lead to 'a perfect and entire unity and uniformity throughout the nation.' During the rule of the Protector Cromwell, the Church of England had been in a very anomalous condition. Most of the clergy who held office during the early period of the Civil Wars were strong royalists, and either were ejected or fled, when the cause of the parliament triumphed. Their places had been supplied in many cases by zealous Presbyterians—a rather numerous body in England at that time, and thus it happened at the restoration of Charles II. that a considerable section of the ministers *within the church* were hostile to the re-introduction of Episcopalian order and practice. Aware of this feeling, yet desirous of not adopting severe measures, if such could possibly be avoided, the king issued letters-patent dated 25th March appointing twelve bishops with nine clergymen as assistants on the side of the Episcopal Church, with an equal number of Presbyterian divines, 'to advise upon and review the *Book of Common Prayer*.' Among the Episcopalian commissioners were Frewen, Archbishop of York, Sheldon, Bishop of London, Gauden of Exeter, Reynolds of Norwich, &c.: among their assistants, Dr. Peter Heylin, Dr. John Pearson, and Dr. Thomas Pierce. The most notable representatives of the Presbyterian party were Richard Baxter, Dr. John Wallis (then Savilian Professor of Geometry at Oxford), Edmund Calamy, William Spurstow, and Matthew Newcomen. The Conference (which lasted four months) was opened on the 13th of April.

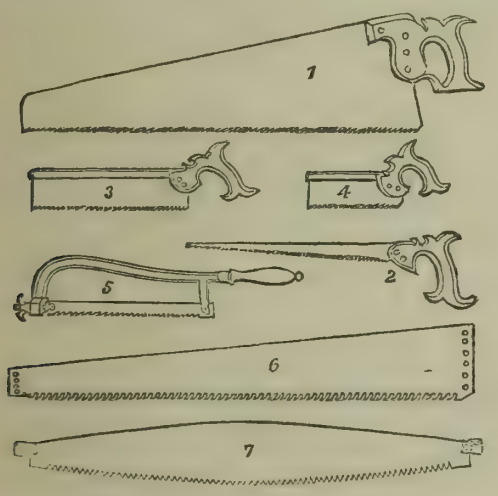
The Presbyterians (according to Burnett) demanded that Archbishop Usher's scheme of a 'reduced episcopacy,' in which the elements of the Scotch system of presbyteries, synods, and general assemblies were combined with distinctions of ecclesiastical ranks, should be made the basis to begin with; that responses should be given up; that the prayers in the Litany should be combined into one; that no lessons should be taken out of the Apocrypha; that the psalms read in the daily service should be according to the new translation; that the term regeneration (among others) should be struck out of the baptismal service; and that the use of the surplice, of the cross in baptism, of godfathers as sponsors, and of the holy days, should be abolished. They were told in reply that the commission had no authority to discuss questions affecting the government of the church, such as were contained in Archbishop Usher's scheme; whereupon they proceeded to consider the minor points, such as the alterations of the Liturgy. Baxter, with the consent of his party, drew up a 'Reformed Liturgy' which the Episcopalian commissioners would not look at, considering the wholesale rejection of the older one *ultra vires* on their part. Finally, the parties separated without

* It is a remarkable fact, in connection with the history of this family, that they have numbered among them more great warriors and politicians than any other royal House of Europe.

arriving at any conclusion; and this fruitless attempt at 'comprehension' was followed in 1662 by the famous 'Act of Uniformity,' the result of which was that 2000 clergymen were forced to abandon their livings in the Church of England.

SAVU' ISLANDS, The, lie in the Indian Ocean. Pop. 35,000. They are small, except Savu, in 121° 45′—122° 7′ E. long., and 10° 25′—10° 36′ S. lat.; area, 237 sq. miles. It is healthy, and moderately fertile, the thermometer ranging from 76° to 88° F. by day, and 68° to 70° by night. The products are those of the Archipelago, including tobacco and horses, but ships from Timor no longer call for horses. The five rajahs have relations with the Dutch Indian government, whose post-holder resides at Seba, the rajah of which possesses much influence, is a Christian, and has a missionary on the island. There is good anchorage at Seba. The Savunese are of Malay race—brave, and feared by their neighbors. Their religion is a traditionary heathenism, in which the offering of sacrifices of dogs is frequently practised.

SAW, one of the most important tools used in working timber. It usually consists of a long strip of thin steel, with one edge cut into a continuous series of sharp teeth. Notwithstanding the great simplicity of the principle upon which the saw is made, it admits of great variation, and modern carpentry has brought into use a great many kinds of saws adapted to different purposes. The most common is the *Hand-saw* (fig. 1), in general use. For this the blade is broader at one end than the other, and a wooden handle is fixed to the broader end, without which it could not be used. This kind of saw is varied by the manner in which the teeth are cut and set, and in the shape and width of the blade, as in *Compass* or *Key Saws* for cutting small holes (fig. 2). Other kinds of hand-



saws, such as the *Back-saw* (fig. 3) and the *Tenon-saw* (fig. 4), have straight blades, and the back is guarded and strengthened by a piece of brass or iron bent over it. The *Bow-saw* (fig. 5) is used for a variety of purposes; the blade, which is always thin, is stretched like a bowstring to an iron frame. The *Frame-saw* (fig. 6), chiefly used in sawpits and mills for cutting timber longitudinally, is similar in shape to the ordinary hand-saw, but much larger, with holes at each end, for fixing it in the frame by which it is moved up and down. For cutting timber transversely, the *Cross-cut-saw* (fig. 7) is used; this differs not only in shape, but in

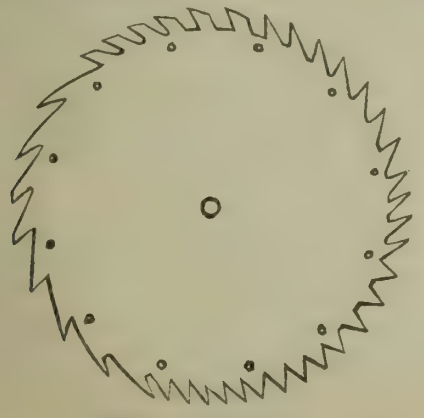


Fig. 8.—Circular-saw.

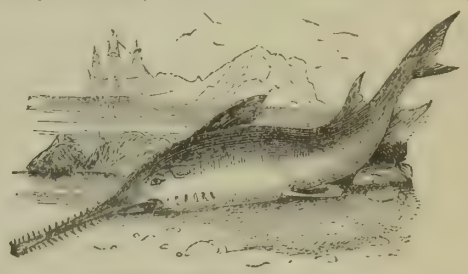
the set of the teeth from other saws. Within the present century, the *Circular-saw* (fig. 8) has come into universal use wherever machinery can be had for working it. It is generally so fitted as to be worked under a flat bench, a part only of the blade projecting through a narrow slit cut in the top of the bench. It is made to revolve with great rapidity, and the wood resting on the bench is pushed against the saw in the direction it is intended to be cut. The rapidity with which wood is cut by the circular-saw is truly marvelous. To save space, several forms of teeth are shown in the figure, but each saw has but one kind. The *Ribbon-saw* is comparatively a new invention. It consists of a very long band—or web, as it is called—of steel, usually very narrow, and with finely-cut teeth. The two ends are joined together so as to form an endless band, which is passed over two revolving drums, one above, and the other below the working-bench, through holes in which the saw passes. With this work, the finest patterns in open work may be cut out with great ease and rapidity. Numerous other kinds of saws are in use, but these are the chief.

SAWDUST. The waste made by sawing timber, formerly of little or no use, has now become a material of some value in localities where it can be applied. Its most interesting application is one very recently patented by Messrs. Dale & Co., of Manchester, whereby it is converted into oxalic acid, and with so much success as to have nearly or altogether displaced every other method of making that chemical. The process is very simple. The sawdust is first saturated with a concentrated solution of soda and potash in the proportion of two of the former to one of the latter; it is then placed in shallow iron pans, under which flues run from a furnace, whereby the iron pans are made hot, and the saturated sawdust runs into a semi-fluid, pasty state. It is stirred about actively with rakes, so as to bring it all in contact with the heated surface of the iron, and to granulate it for the succeeding operations. It is next placed in similar pans, only slightly heated, by which it is dried. In this state it is oxalate of soda mixed with potash. It is then placed on the bed of a filter, and a solution of soda is allowed to percolate through it, which carries with it all the potash, leaving it tolerably pure oxalate of soda. It is then transferred to a tank, in which it is mingled with a thin milk of lime, by which it is decomposed, the lime combining with the acid to form oxalate of lime, and the soda being set free. Lastly, the oxalate of lime is put into a leaden cistern, and sulphuric acid is poured in; this takes up the lime, and sets free the oxalic acid, which readily crystallizes on the sides of the leaden cistern, or on pieces of wood placed on purpose. So rapid and cheap is this method, compared with that formerly in use, that several extensive manufactories for making oxalic acid in the old manner have been shut up, being unable to compete with the patent process.

Another interesting use of the sawdust of hard woods, such as rosewood, ebony, &c., is that recently made known in France under the name of *Boisdurci*. The various kinds of sawdust used are reduced to fine powder, and mixed with blood into a paste; other materials are doubtless added, for when pressed into moulds it is jet black, and receives the most beautiful impressions. Messrs. Latry, Senior, & Co. of Paris produce some very beautiful medallions and other small articles in this material.

SAWFISH (*Pristis*), a genus of cartilaginous fishes, constituting the family *Pristidæ*, which is ranked with the Rays (q. v.)



Sawfish (*Pristis antiquorum*).

although the elongated form of the body agrees rather with that of the sharks. In a number of anatomical characters, however, the sawfishes differ from sharks, and agree with rays, and conspicuously in the position of the gill-openings, which are not on the sides, as in sharks, but on the under-surface, as in rays. The mouth is on the under surface of the head, and is furnished with pavement-like teeth, adapted for crushing. But the S. is particularly remarkable for the elongation of the snout into a flat bony sword, armed on each edge with about twenty large bony spines or teeth; a most formidable weapon, of which it seems to make use for killing prey, rushing amongst shoals of fishes, and slaying them right and left. Whales are said to be sometimes killed by sawfishes, and the saw has been sometimes driven into the hull of a ship. There are six or seven known species of S., and they are distributed over the whole world. The Common S. (*P. antiquorum*) was known to the ancients, being found in the Mediter-

ranean. It is a very widely distributed fish, being found both in polar and tropical seas. It sometimes attains the length of eighteen feet, including the saw. Sawfishes are seldom seen near the shore, and no species is reckoned among British fishes.

SAWFLY (*Tenthredo*), a Linnæan genus of insects of the order *Hymenoptera*, now divided into many genera, and constituting a family of which the species are very numerous. They derive the name S. from the ovipositor of the females, which is, scaly, serrated, pointed, and enclosed in a sheath of two concave plates. By means of this instrument, the female S. perforates the stalks or other parts of plants, laying an egg in each hole. The hole soon becomes filled with a frothy liquid, and sometimes a gall-like swelling is formed, within which the larva resides.

Turnip Sawfly (*Athalia spinarum*), in its various stages of Transformation.

The larvæ of many sawflies, however, live in no such nests, but feed on foliage, like caterpillars, which they very much resemble. One of the most common species of gooseberry 'caterpillar' is the larva of a S. (*Nematus ribesii*). Sawflies have the abdomen cylindrical, and so united to the thorax that the distinction is not easily perceived. They vary much in the antennæ. Both pairs of wings are divided by nervures into numerous cells. Among the more notable species is the CORN S. (*Cephus pygmæus*), which, in its perfect state, abounds on umbelliferous flowers, a shining black insect, marked with yellow, the abdomen elongated. The larva consumes the inside of the straw of corn, and descending to the base of the straw, cuts it down level with the ground.—Another important species is the TURNIP S. (*Athalia spinarum*), reddish, spotted with black; the larva nearly black, and known by the names of *Black Jack* and *Nigger*. The Turnip S. is sometimes very troublesome and destructive for a year or two, and then almost completely disappears for a number of years. It has sometimes been very destructive to the turnip-crops of Britain.—The S. of the Pine (*Lophyrus pini*) is a common British species, and sometimes, although not very often, strips pine and fir trees of their leaves.

SAW-MILL. Within the present century, the art of working saws by machinery has been invented, and large mills for cutting up timber by means of large saws worked by machinery, are to be found in most civilized countries. They are worked both by steam and water-power, and in Holland, wind-mills are made to work sawing machinery. The arrangements of a saw-mill are very simple: they consist of a fixed horizontal frame, with rollers at short intervals, upon which the tree or log of timber is laid; at the end of this, another frame is placed in a vertical position; it contains as many saws placed side by side as it is proposed to cut planks out of the log, and they are set as far apart as the desired thickness of the planks or boards. A rapid up-and-down motion is given to these saws by the machinery, and at the same time the log is pulled forward on the rollers by the same power, so as to be kept constantly up to the saws. In this way, a large tree or log of wood may be cut into twenty planks in much less time than was formerly required by laborious hand-labor to cut one single thickness.

The circular-saw is also much used in mills for cutting planks and boards into pieces of almost any form.

SAXE, HERMANN MAURICE, COUNT OF, one of the greatest warriors of the 18th c., was the natural son of Augustus II. (q. v.), Elector of Saxony and king of Poland, and the Countess Aurora von Königsmark, and was born at Goslar, 28th October 1696. When only twelve years of age, he ran off from home, made his way to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change, he joined the Russo-Polish army before Stralsund (1711), and after the taking of Riga, returned to Dresden, where his mother induced him, in 1714, to espouse a young and amiable German heiress. In the two following years, he took part in the civil war then raging in Poland; but having quarrelled with his father's favorite minister, he returned to Dresden, where the well-grounded jealousy of his wife made his life sufficiently disagreeable.

Obtaining the annulment of his marriage, and a pension from his father, he came to Paris in 1720, where he devoted himself for some years to the study of military tactics, and originated and developed an entirely novel system of manœuvres, which was highly spoken of by the Chevalier Folard, the celebrated military engineer. In 1726, he was elected Duke of Courland, and for a time maintained himself in his new possession against both Russians and Poles, but was compelled to retire to France in the following year. Joining the army on the Rhine, under the Duke of Berwick, he signalized himself at the siege of Philipsburg (1734), and decided the battle of Ettingen by a desperate charge at the head of a division of grenadiers. For these services, he was made a lieutenant-general in 1736; and on the breaking out of the war of the Austrian Succession, he obtained the command of the left wing of the army which was appointed to invade Bohemia, and took the strongly-fortified town of Prague by storm with marvelous celerity. The capture of Egra was similarly effected a few days afterwards, and the rest of the campaign showed that his abilities in the field were not inferior to his skill against fortifications. In 1744, he was made a marshal of France, and appointed to command the French army in Flanders, and on this occasion he gave decisive proofs of the soundness and superiority of his new system of tactics, by reducing to inaction an enemy much superior in number, and taking from him, almost before his face, various important fortresses. The following year was for him more glorious still; his army was reinforced, and though so ill with dropsy that he had to submit to tapping (15th April), he laid siege to Tournay on the 22d, and on the advance of the Duke of Cumberland to its relief, took up a position at Fontenoy, and awaited attack. He was assailed on the 11th May, and the desperate valor of the English for a time bore down everything before them; but S. sped about in his litter, encouraging his troops, and when the critical moment came, the fire of his artillery disorganized the English, and a charge of the French completed the victory.

Four months afterwards, every one of the numerous strong fortresses of Belgium was in his hands. In 1746, S., by a series of able manœuvres, threw back the allies on the right bank of the Maese, and gained (11th October) the brilliant victory of Raucoux, for which he was rewarded with the title of marshal-general, an honor which only Turenne had previously obtained. For the third time, at Laufeldt (2d July 1747), the victor of Culloden suffered complete defeat at the hands of S., whose favorite system of tactics was again brought into full play; and the brilliant capture of Bergen-opzoom brought the allies to think of peace.

The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the peace of Aix-la-Chapelle followed. S. had previously carried on a correspondence with the great Frederick of Prussia, and he now took occasion to visit him at Berlin, experiencing the most brilliant reception. In the following year, Frederick wrote to Voltaire: 'I have seen the hero of France, the Turenne of Louis XV.'s time. I have received much instruction from his discourse on the art of war. This general could teach all the generals in Europe.' S. lived at his estate of Chambord for some time afterwards, and died there of dropsy, 30th November 1750. His work on the art of war, entitled *Mes Rêveries*, was published at Paris in 1757.

S. was probably the greatest captain of his time, and a gallant and enterprising leader, but he was a mere soldier, and the offer of membership made to him by the Académie Française is sufficiently ridiculous. S. had, however, the good sense to decline the proffered honor, and he did so in a sentence, the extraordinary orthography of which accidentally rebuked, more than the most cutting sarcasm could have done, the mean sycophancy of the Académie. He wrote: 'Ils *veule* me *fere* de *la cademie; sela* m'*iret come* une *bage* a un *chais*.'

Many biographies of S. have been written, but few of them are to be much depended upon.—See *Moritz von Sachsen* (Dresden, 1863), by Karl von Weber; and the *Nouvelle Biographie Générale* (art. 'Saxe'). His character and genius are also well, though not flatteringly, portrayed in Carlyle's *Life of Frederick the Great*.

SAXE-A'LTENBURG, the smallest of the minor Saxon states, is a duchy bounded by Saxe-Weimar, Prussian Saxony, the kingdom of Saxony, Saxe-Meiningen, and Schwarzburg-Rudolstadt, and separated into two nearly equal parts by the interposed principality of Reuss-Gera. The eastern portion, or *circle of Altenburg*, from its being watered by the Pleisse, was formerly called *Pleissengau*. It contains 254 English sq. m., with a pop. (1871) of 94,502. The western part, or *circle of Saal-Eisenberg*, is watered by the Saale, with the Orla and Rode, and contains 256 English sq. m.; pop. (1871) 47,620. Total area, 510 sq. m., pop. (1871) 142,122; (1880) 155,036, nearly half of whom are inhabitants of towns. The vast bulk of the population (999 in 1000) are Prot-

estants, there being in 1872 only 193 Catholics, 16 Christian sectaries, and 10 Jews. The eastern portion is open, undulating, and very fertile, and agriculture has here attained considerable perfection, and is diligently pursued by a large proportion of the population, so that much more corn is produced than is necessary for home-consumption. The peasants in this circle, though speaking the Thuringian dialect, exhibit in their dress, manners, and customs a family resemblance to the Wendish-speaking Serbs of Lusatia; and numerous names of places, especially those ending in *itz*, indicate their Slavic origin. They are celebrated throughout Germany for their skill as agriculturists, and their superior intelligence, knowledge, and comparative wealth. The budget estimate of revenue for 1878–80 was £113,717; and the expenditure, including the duke's civil list of £22,900, to the same sum. The troops are, of course, under the command of the emperor of Germany.

S. is a limited monarchy, in accordance with the constitution of 29th April 1831, modified somewhat by the events of 1848—1849. By the law of 1870, the single chamber consists of 30 members, 9 representing the towns, 12 the country, and 9 the persons who pay most taxes. The government is in the hands of a ministry of three. As a member of the empire, S.-A. has one vote in the council, and one representative in the diet. Altenburg (q. v.) is the seat of government. See GERMANY.

SAXE-CO'BURG-GO'THA (in German, SACHSEN-KOBURG-GOTHA), the third in point of size and population of the minor Saxon states, is a duchy comprising the duchy of *Gotha*, lying between Prussia, Schwarzburg, Meiningen, and Weimar, and containing 542 English sq. m.; pop. (1871) 122,630; and the duchy of *Coburg*, 18 miles south of Gotha, lying between Meiningen and Bavaria, and containing 215 English sq. m.; pop. (1871) 51,709. Total area, 757 English sq. m.; pop. (1871) 174,339; (1880) 194,716. In 1871 there were 172,786 Protestants; 1263 Roman Catholics, and 210 Jews. Gotha lies on the north side of the Thuringer-wald, which extends along and within its southern frontier; but the rest of this duchy consists of low, undulating, and very fertile land, and is watered by the Werra, an affluent of the Weser, the Unstrut, a tributary of the Saale, and several smaller streams. Coburg lies on the southern slope of the same range, is watered by the Itz and Rodach, affluents of the Main, and has extensive forests, and many beautiful valleys between the spurs of the Thuringer-wald. Of the surface of the whole duchy, $\frac{5}{8}$ths is arable, $\frac{2}{8}$ths is wood, $\frac{1}{14}$th waste land, and the rest pasture and gardens. In the plains and valleys, the climate is mild and salubrious, but in the mountainous parts of Gotha it assumes a more inclement character. Agriculture is the principal occupation of the people, and is pursued with energy and skill; corn and flax being produced in abundance, as also potatoes, and various leguminous plants. The breeding of horses, cattle, and sheep is also successfully conducted. The mineral wealth includes coal (chiefly in Gotha), iron, cobalt, manganese; also marble, porcelain-earth, mill-stones, and salt. The manufactures are not of much importance, and are chiefly confined to Gotha. There is a large beet-sugar-factory at Gotha. The extensive forests of the duchy employ a large proportion of the population in the production of pitch, tar, and potash.

The duchy is a limited monarchy, in accordance with the fundamental law of 3d May 1852. Coburg and Gotha have each a *landtag*, or diet; that of the former consisting of 11, and of the latter of 19 deputies; besides which there is a common landtag for the whole state, composed of 7 of the Coburg, and 14 of the Gotha representatives, who are elected by their several diets. The particular diets for the two duchies are elected by the people at large. There are two ministers for carrying on the government—one for Coburg, and another for Gotha. As a member of the empire, S.-C.-G. has one vote in the federal council, and has the right to choose two deputies to the imperial diet. As in other German states, the troops are under the command of the emperor of Germany. Education is well diffused; and the higher education is cultivated by the several gymnasia and academies.

The finances of the two portions of the duchy are separately administered. For the period 1877–81, the estimated annual revenue of Coburg (both revenue from the crown domains and state revenue) was close on £66,000, the expenditure being £58-500. Of Gotha, the total annual revenue is given at £227.000, and the expenditure at £185,000. The joint debt of both in 1878 was £545,000, of which, however, a large portion is 'active capital.' The present ducal family is distinguished for the spirited and liberal character of its members, as well as for physical and mental gifts. It is allied with several of the royal families of Europe, the present duke's younger brother having been the late Prince Albert of Great Britain, and his uncle, Leopold I., the late king of the Belgians. The heir-apparent to the duchy is Alfred, Duke of Edinburgh, the second son of Queen Victoria of Great Britain. All the Saxon ruling families are descended from the Counts of Wettin, a place near Magdeburg. See GERMANY.

SAXE-MEI'NINGEN (also called SAXE-MEININGEN-HILDBURGHAUSEN), the second in size and population of the minor Saxon states, is a duchy, consisting of one large crescent-shaped territory, which lies immediately north of Bavaria and Coburg, with the horns of the crescent pointing northwards, and contains 862 English sq. m., and two small isolated territories, Kranichfeld and Kamburg. The area of the whole is 955 square miles, with a pop. in 1871 of 187,884; (1880) 207,075. In 1866, when other administrative changes and reforms were introduced, the territory, which till then had been divided into 11 administrative districts, was distributed into 4. Of the total population, 181,964 were, in 1871, Protestants; 1564 were Roman Catholics; 1625 were Jews; and 165 Christian sectaries of various kinds. The crescent is composed of the old duchy of Meiningen, the old duchy of Hildburghausen, and the principality of Saalfeld (both of which, along with Kamburg, were annexed to Meiningen in 1826). S. forms the south-west of Thuringia (q. v.), and is traversed in the east and north by the Thuringer-wald, offshoots from which also cover the west, while the Rhön-gebirge enters the country at the south-west. Its surface is thus necessarily hilly, in some places even mountainous, Kieferle in the Thuringer-wald being 2700 feet, and Geha-berg in the Rhön-gebirge, 2308 feet above sea-level; but between the mountain ridges are numerous fruitful valleys, and that of the Werra in particular is one of the most fertile and picturesque in Germany. The Werra, Saale, Milz, Steinach, Itz, &c., water the country. Two-fifths of the country is arable land; a nearly equal extent is under wood; and the rest is meadow, garden and vineyard, and waste. In the lower lands, agriculture is in an advanced condition, and is prosecuted with such vigor, that corn enough is produced for home-consumption; potatoes, hemp, flax, and tobacco are the other chief crops.

The mining industry of the east and north is considerable, employing recently about 550 men; and the important mineral products are iron, copper, cobalt, coal, porcelain-clay, sulphur, and salt from the works of Salzungen, Neusulza, and Friedrichshall. S.-M. is also an active manufacturing district, chiefly in woollen, cotton, and linen fabrics, and paper; and brewing, distilling, the making of glass and porcelain, and various other branches of industry, are prosecuted. The fabrication of wooden toys in the district around Sonneburg employs 2092 men, and the produce is bought up by the Sonneburg dealers for export. A rape-sugar factory is maintained. S.-M. is a limited monarchy in accordance with the fundamental law of 1829, and the laws of 1871 and 1873. The diet consists of 24 representatives—4 representing the more extensive landowners, 4 the persons who pay most taxes, and 16 being the deputies of the rest of the inhabitants. As a member of the empire, S.-M. has one vote in the federal council, and sends 2 deputies to the diet of the empire. The troops of S.-M. form part of the imperial army. The government is carried on by four ministers, each of whom heads a separate department. The budget for 1880—1882 gives as receipts £232,028 (of which £100.000 come from the domains); as expenditure, £206,155. In 1880 the net public debt amounted to £34.000. The late duke, Bernard-Erich-Freund, who reigned for 63 years spontaneously gave his subjects a liberal representative constitution in 1824. S.-M. had for some time the distinction of being the best-governed state in Germany. See GERMANY.

SAXE-WEI'MAR-EI'SENACH, the largest of the minor Saxon states, is a grand duchy, consisting of *Weimar*, which lies between Prussia, Altenburg, and Schwarzburg-Rudolstadt, and contains (inclusive of Allstädt, on the Unstrut, within Prussia, 45 English sq. m., and Ilmenau, in the south-east of Gotha, 32 English sq. m.) 683 English sq. m., with a pop. (1871) of 151,379; *Eisenach*, the western portion, which lies to the north of Meiningen and Bavaria, and contains (inclusive of Ostheim, in the Rhön-gebirge, in Bavaria, 23 English sq. m.) 471 English sq. m., with a pop. (1871) of 84,298; and *Neustadt*, which lies on the western boundary of the kingdom of Saxony, and contains 239 English sq. m., pop. (1871) 50,506; total area, 1403 English sq. m.; pop. 286,183, of whom 275,492 are Protestants, 9404 Roman Catholics, 53 Greek Catholics, 1120 Jews; the Jews and Catholics being chiefly in Eisenach. Pop (1880) 309,577. The Eisenach portion is traversed in the N. by the Thuringer-wald, and in the S. by the Rhön-gebirge, the intermediate districts being also hilly and undulating, and watered by the Werra and its feeders, the Fulda, Ulster, Suhl and Orsel. The Neustadt division is traversed from south-east to north-west by several offshoots of the Erz-gebirge, but most of the surface belongs to the plain of the Saale, and is watered by the Elster and Orla, affluents of that river. The Weimar portion is also partly hilly and uneven, and partly belongs to the plain of the Saale, which, with its tributary, the Ilm, traverses it. The highest peak in the grand duchy is Hinkelhahn (2694 feet), in the detached territory of Ilmenau. The climate is somewhat inclement in the high lands, more temperate in the plains, and particularly pleasant along the valley of the Saale. Of the whole surface, about $\frac{3}{5}$ths is arable, $\frac{3}{11}$ths is forest, and

the rest is meadow-lands, gardens, and vineyards. Agriculture is in an advanced condition, and is diligently prosecuted, there being frequently a surplus of grain over and above that required for home-consumption, in spite of the occasional infertility of the soil; and potatoes, pulse, hemp, flax, hops, and (on the banks of the Saale) vines are also cultivated.

Horse and cattle breeding is a common pursuit in Neustadt and Eisenach, and sheep-breeding in Weimar, the sheep having the usual good reputation of the Saxon breed. The mineral wealth comprises coal, iron, copper, cobalt, and marble. Eisenach is the chief seat of the manufacturing industry, with the exception of the woollen manufactures, which are principally carried on in Neustadt. The form of government is, according to the revised fundamental law of 15th October 1850, a limited monarchy; the diet, or landtag, is composed of 31 deputies, 1 representing the landed nobility, 4 chosen by landed proprietors with incomes under 1000 thalers, 5 by those who possess the same income from other sources, and 21 by universal suffrage. The government is administered by three heads of departments. As a member of the empire, S. has one voice in the federal council, and elects three deputies to the imperial diet. The troops of S. form part of one of the Thuringian regiments in the 11th *corps d'armée* of the empire. The budget for the financial period 1878—1880 shows annual receipts amounting to £338,340, and an annual expenditure of £536,884, leaving a small balance in favor of the exchequer. The public debt amounted in 1879 to a total of £368,600. The Grand-duke of Weimar is the chief of the Ernestine branch of the House of Saxony. The most celebrated of the Weimar family was Duke Karl-August, the Mæcenas of the art, literature, and science of Germany, who took the reins of government in 1775, and displayed extreme anxiety to favor the development of public prosperity and the progress of education. Under his fostering care, the university of Jena became a focus of intellect and knowledge to Germany; and the presence of Herder, Goethe, Schiller, and others at his court, well entitled it to be denominated the abode of the muses. He also elevated the theatre of Weimar to its present position as the chief German school of dramatic art. In 1806, he joined the Confederation of the Rhine with the title of duke, and received from the Congress of Vienna an accession of territory, and the title of grand duke. In 1816, he granted a liberal representative constitution to his subjects, expressly guaranteeing the liberty of the press, and died 14th June 1828. His successors have followed in his footsteps. See GERMANY.

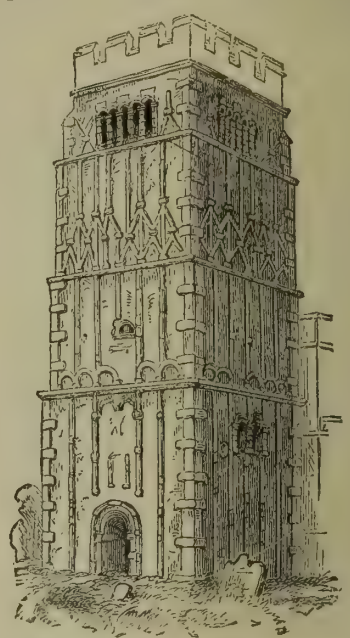
SA'XIFRAGE (*Saxifraga*), a genus of plants of the natural order *Saxifrageæ* or *Saxifragaceæ*. This order has a calyx, usually, of five sepals more or less cohering at the base; a corolla usually of five perigynous petals, alternate with the sepals, rarely

Saxifrage (*S. stellaris*).

wanting; perigynous stamens; a hypogynous or perigynous disc; an ovary, usually of two carpels, cohering more or less by their face, but diverging at the apex; fruit generally a 1—2-celled capsule, the cells opening at the ventral suture, and often divaricating when ripe; the seeds usually minute and numerous. The order *Saxifrageæ* is sometimes regarded as including above 900 species divided into several suborders, which are elevated by some botanists into distinct orders—leaving, however, more than 300 species to the reduced order SAXIFRAGEÆ, which contains herbaceous plants, often growing in patches, with entire or divided alternate exstipulate leaves, natives chiefly of mountainous tracts in the northern hemisphere, and often found up to the limits of perpetual snow, some of them forming there a rich and beautiful turf, and adorning it with their very pleasing flowers. A considerable number are natives of Britain. Some of the genus *Saxifraga* are well known in gardens and are employed to cover rock-works, &c. *S. umbrosa*, London Pride, or None-so-pretty, is familiar in all cottage gardens. It is a native of the hills of Spain, and of the south and west of Ireland.

SAXO-GRAMMATICUS (i. e., Saxo the 'Grammarian' or 'Scholar'), the most celebrated of the early Danish chroniclers, flourished in the 12th c., and was secretary to Archbishop Absalom. He is said to have died at Koeskilde in 1204. S. undoubtedly formed his style on that of the later Roman historians, particularly Valerius Maximus, yet in his whole mode of representation, he belongs to the school of medieval chroniclers, although ranking first in that school. Erasmus half wondered at his elegance. Moreover, it adds mightily to our respect for S., that although a cleric, he did not in the very least degree allow himself to be swayed in his historical conceptions by the prejudices incident to his profession. His work is entitled *Historia Danica*, and consists of 16 books. The earlier portions are of course not very critical, but in regard to times near his own, S. is a most invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history—the 'Heroic Age' of the North—from old songs, Runic inscriptions, and the historical notices and traditions of the Icelanders; but he is not sharply critical in his treatment of the Danish sagas, although a rudimentary critical tendency is occasionally visible. The best edition of the *Historia Danica* is that undertaken by P. E. Müller, and finished by J. M. Velschov (Copen. 1839.) It is furnished with a complete critical apparatus. There are good translations from the original Latin into Danish.

SAXON ARCHITECTURE, the style of building used in England before the introduction of the Norman architecture at the Conquest. There are few specimens remaining which can be depended upon as genuine. The Saxons built chiefly in wood, and



Tower of Earl's Barton, Northamptonshire.
(From Parker's *Glossary of Architecture.*)

all their wooden edifices are now lost. It seems probable that a rude and simple style, not unlike Early Norman, was that used by the Saxons. There are several buildings in England which Mr. Rickman considers entitled to rank as Saxon. Amongst these, the Tower of Earl's Barton, Northamptonshire, is one of the best examples. The peculiar 'long and short' work of the quoins, the projecting fillets running up the face of the walls, and interlacing like wood-work, and the baluster-like shafts between the openings of the upper windows, are all characteristic of the style.

SA'XON LAND. See TRANSYLVANIA.

SAXON STATES, MINOR. The capitulation of Wittenberg, which followed the rout of Muhlberg (see SAXONY), and deprived John Frederick the Magnanimous of the electorate of Saxony, at the same time despoiled him of a large portion of the hereditary possessions of the Ernestine branch. The remainder, amounting —after the acquisition of Coburg, Altenburg, Eisenberg, &c., in 1554—to little more than one-fifth of the whole Saxon territory, was divided into two portions, *Saxe-Gotha* and *Saxe-Weimar*, the former falling to John Frederick II., and the latter to John William, the two sons of the deposed elector. Each of these portions was afterwards subdivided, the former into *Saxe-Coburg* and *Saxe-Eisenach*, and the latter (1573) into *Saxe-Weimar* and *Saxe Alten-*

burg. It would only bewilder the reader to attempt to follow the endless subdivisions and reunions that followed. Suffice it to say, that the gradual adoption of the law of primogeniture during the 18th c., and the extinction of various cadet branches, has left the four states of Saxe-Altenburg, Saxe-Coburg-Gotha, Saxe-Meiningen, and Saxe-Weimar-Eisenach, as described under their several names. Should the Albertine or Saxon-royal line become extinct, the Duke of Weimar succeeds to the throne; and failing his family, the lines of Saxe-Meiningen, Saxe-Altenburg, and Saxe-Coburg-Gotha obtain in this order the right of succession.

SAXON SWITZERLAND. See SAXONY.

SAXONS (Lat. *Saxones*, Ger. *Sachsen*), a German people, whose name is usually derived from an old German word *sahs*, meaning a 'knife,' are first mentioned by Ptolemy, who makes them inhabit a district south of the Cimbrian Peninsula. Towards the end of the 3d c., a 'Saxon League' or 'Confederation' makes its appearance in North-western Germany, to which belonged, besides S. proper, the Cherusci, the Angrivarii, and the largest part of the Chauci. In the times of the emperors Julian and Valentinian, S. and Franks invaded the Roman territory; but their piratical descents on the coasts of Britain and Gaul are far more famous. At what period these commenced, it is impossible to tell, but it is believed to have been much earlier than is commonly supposed. Recent investigations seem to prove that S. had established themselves in England long before the time of the mythical Hengist and Horsa (see ANGLO-SAXONS); and we know that as early as 287 A.D., Carausius, a Belgic admiral in the Roman service, made himself 'Augustus' in Britain by their help. They had firmly rooted themselves, at the beginning of the 5th c., in the present Normandy, where a tract of land was named after them, the *Limes Saxonicus*. They fought against Attila (q. v.) in the Catalaunian Plain, 451 A.D. They also obtained a footing at the mouth of the Loire; but all the S. who settled in France 'disappeared' before the Franks, i. e., were probably incorporated with their more powerful kinsmen of Southern Germany. At home, the S. (called *Alt Sachsen*, or 'Old Saxons,' to distinguish them from the emigrant hordes who found their way to England and France) enlarged, by conquest, their territory north and northwest as far as the North Sea, the Yssel, and the Rhine; south, as far as the Sieg, and nearly to the Eder; eastward, to the Weser and Werra, the Southern Harz, the Elbe, and the Lower Saale. Along with the Franks, they destroyed the kingdom of the Thuringians in 531, and obtained possession of the land between the Harz and the Unstrut; but this district was in turn forced to acknowledge the Frankish sovereignty. From 719, wars between the S. and the Franks became constant; but the latter, after 772, were generally successful, in spite of the vigorous resistance offered by Wittekind; and in 804, the S. were finally subjugated by the arms of Charlemagne. Wittekind was the last Saxon king, and the first Saxon duke of the German empire. A collection of the old national laws and usages of the S., under the title of *Lex Saxonum*, was made during the reign of Charlemagne.

During 1830—1840, A. Schmeller published (from two manuscripts, one preserved at Munich, and the other in the British Museum) an 'Old Saxon' poem of the 9th c., called *Hêliand*, i. e., the 'Healer,' or 'Saviour,' which narrates in alliterative verse the 'History of Christ' according to the Gospels, whence it is also called the 'Old Saxon Gospel Harmony.' It is probably a part of a more comprehensive work, embracing a poetical treatment of the history of the Old and New Testament, which Ludvig the Pious intrusted to some celebrated Saxon singer. This unknown poet lived, as his language leads us to conjecture, somewhere between Münster, Essen, and Kleve. His work is not only the almost sole monument of the old Saxon tongue left us, but is also of high poetical value, through its warmth of feeling, and the strength and splendor of its diction—worthy, indeed, to take its place alongside the contemporary Anglo-Saxon and old Norse poetry.—See Vilmar's *Deutsche Alterthümer im Hêliand* (Marb. 1845).

SA'XONY (Ger. *Sachs n*), KINGDOM OF, the second in importance and population of the minor German states, though inferior to three of them in extent, is bounded on the N. by Prussia, S. by Austria, and W. by Bavaria and the Saxon duchies. Population in 1881, 2,972,805. In 1875 it was distributed over the four districts of the kingdom as follows:

	English Sq. Miles.	Pop. in 1875.
Dresden	1680	749,503
Leipzig	1370	639,731
Zwickau	1790	1,031,905
Bautzen	950	339,203
Total	5790	2,760,342

The kingdom is somewhat of the form of a right-angled triangle, with the right angle in the north-west and the longer side lying along the foot of the Erz-gebirge range, which sends its spurs northward over the southern half of the country, giving to that portion a somewhat mountainous character, while the northern half remains a flat or undulating plain. The whole country, with the exception of a small portion in the extreme east, which belongs to the Oder basin, and is watered by the Neisse, is drained by the Elbe (which is wholly navigable in S.) and its tributaries the Muglitz, Wilde-Weisseritz, Trubsch, Mulde, and White Elster, on the west; and the Wessnitz, Black Elster, and Spree on the east. From the point where the Elbe bursts through the Erz-gebirge chain to within about 8 miles of Dresden, it traverses a district rich in picturesque scenery, to which the somewhat inappropriate name of *Saxon Switzerland* has been given. This district, which averages about 24 miles long by 23 broad, is an elevated plateau of coarse crumbling sandstone (much resembling the English green-sand); and though destitute of the perpetually snow-clad mountains, glaciers, serrated ridges, and escarped peaks which give a character of lofty grandeur to its namesake, it can boast of features equally peculiar and strikingly romantic. From the soft nature of the rock, it has yielded freely to the action of the mountain rills, which rise from the hills on its east and west borders, and converge to the Elbe, and is cut up in all directions by deep narrow gorges (so symmetrical in their formation as to resemble artificial lanes), the constantly deepening beds of these mountain torrents, which here form cascades, there sullenly glide through deep vales bordered by rocks of the most fantastic forms, or by steep rugged slopes thickly clad with trees. High above the level of the plateau rise towering rocks, some of them pyramidal or conical, others pillar-like, while a few taper almost to a point, and then bulge out at the top; all clearly testifying to the agency by which they have been produced. The medieval knights took advantage of these curious results of nature's so-called freaks, to erect castles upon the summits of some of them; several of these castles still exist, and one of them, Königstein, is almost the only virgin fortress in Europe.

The most remarkable of these peaks are Königstein (864 feet), Lilienstein (1254 feet), the Bastei (600 feet), Nonnenstein, Jungfernsprung, and seven others, each of which possesses its group of traditionary gnomes and kobolds. The lakes of S. are unimportant, and the only canals are those constructed between the mines and ore-mills.

Climate, Soil, Products, &c.—The climate is healthy, and on the whole temperate, though occasionally severe in the south-western districts. Of the whole surface, more than one-half is arable, nearly one-third is in forest, about one-ninth in meadow, while the rest is occupied by gardens and vineyards, coarse pasture and waste land, or quarries and mines. The arable land has long been in a high state of cultivation, as is the case with the whole of Upper S. (see *History*), yet notwithstanding this, and its extreme fertility, the produce is hardly sufficient to supply the wants of the dense population (441 to the English sq. mile). The agricultural products consist of the usual cereals and leguminous plants, with rape, buck-wheat, hops, flax, and potatoes, and all kinds of fruits suited to the climate. The forests, the largest of which are in the Voigt-land (the south-west corner of Zwickau), and along the northern slopes of the Erz-gebirge, supply timber of excellent quality, and in such abundance as to render them one of the great sources of wealth and industry. The rearing of cattle is an important employment in the mountainous districts of the south-west. Sheep, for which S. was formerly so famous, have been less generally attended to of late years, though, from the introduction of merinos, and increased care in breeding and rearing, the quality of the wool has much improved, and at the present day it occupies a high position in the markets of the world. Minerals are another great source of national wealth, the ore being both rich and abundant, and the processes of excavation and smelting in a high state of perfection. Most of the mines belong to the crown; they are situated in Zwickau and Dresden, and mostly on or near the northern slope of the Erz-gebirge. The mineral wealth includes silver, tin, iron, cobalt, bismuth, zinc, lead, nickel, arsenic, antimony, and other metals, besides coal, marble, porcelain-earth, vitriol, and various gems. In 1870, there were in operation 548 mines; 10,045 men were employed in the iron-mines, and 18,377 in coal-mines. The products raised in that year had a value of 12,929,360 thalers (£1,939,404).

Manufactures, Commerce, &c.—Manufacturing industry has also been greatly developed, and several branches have been carried to a high degree of perfection. This species of labor employs nearly three-fifths of the whole population. The oldest manufacture is that of linen, which at present employs more than 16,000 looms; but it is now eclipsed by the cotton-spinning and weaving, which is the most important branch of Saxon industry, has its chief seats at Chemnitz, Frankenberg, Zschoppau, Folkland, and Lausitz, and gives work to upwards of 150 spinning-mills. The woollen manufactures are also extensive. Broad-cloth, thread, merinos, silks, mixed silk and woollen wares, &c., are also produced in considerable quantity, and of excellent quality; the muslin de laines being still preferred by many to those of

England and France, while the laces and embroideries preserve their ancient well-won reputation. Saxon pottery and porcelain have long been famous. The chief centers of manufacturing industry are in Bautzen and in the mountainous country to the north of the Erz-gebirge. Owing to this extension of manufacturing industry, combined with a deficiency in the supply of home-grown articles of consumption, an extensive foreign commerce is rendered necessary, and this is chiefly carried on through the medium of the great fairs of Leipzig (q. v.). The chief imports are corn, wine, salt (not found in S., though common enough in Prussian Saxony), cotton, silk, flax, hemp, wool, coffee, tea, &c. The country is well provided with roads, railways, and lines of telegraph.

Government, Religion, Education, Revenue, &c.—The government of this very interesting country—the reading of the history of which leaves on one's mind a firm sense of both past ages and present activity—is a limited monarchy, hereditary in the Albertine line, and is carried on according to the constitution of September 4, 1831, modified by changes in 1849, 1851, 1860, 1861, 1868, and 1874. By the electoral law passed in the year 1868, the first of the two chambers which constitute the legislature consists of the princes of the royal family, certain nobles, representatives of the Lutheran and Roman Catholic churches, the chief proprietors, representatives of the universities, and the burgomasters of the eight principal towns. The second chamber comprises 35 deputies from the towns, and 45 from the rural communes. The supreme administration is managed by six ministers (of Justice, Finance, the Interior, War, Religion and Education, and Foreign Affairs). The established religion is the Lutheran, though the reigning family, since the time of Fr. Augustus I., have been Roman Catholic. The church department must, so long as the reigning family remains Roman Catholic, be administered by a member of the Established church. In 1871, there were 2,484,075 Lutherans; 9347 Reformed; 53,642 Roman Catholics. The population of S. is by no means purely German; in 1875 there still were upwards of 50,000 who spoke Wendish. S. has upwards of 2000 elementary schools, 11 gymnasia, and 12 *real-schulen;* the university is at Leipzig. The budget for 1880 and 1881 showed annual receipts to the amount of £3,187,980; and the expenditure was a little less. The public debt of S. at the beginning of 1880 amounted to £33,775,000 (a great part of which was incurred for railways). The Saxon troops form the twelfth *corps d'armée* of the German empire. S. has a war ministry of its own; but after the war of 1866, S. paid the penalty of her opposition to Prussia by being compelled to make over to the king of Prussia the supreme military command of the Saxon army, the right to garrison the fortress of Königstein the management of the postal, railway, and telegraphic systems, and the charge of the diplomatic representation of S. abroad. As a member of the German empire, S. has four voices in the federal council, and has a right to send 23 deputies to the diet.

History of the Great Duchy of Lower Saxony and of the Ascanian Electorate of Upper Saxony.—After the final conquest of the Saxons by Charlemagne, they became one of the components of the German empire; but their country by no means corresponded to what is now known as Saxony. It included the most of the country between the Elbe, the Harz Mountains, the Rhine, and Friesland; and, in 850, was erected into a dukedom, with Lubeck for its capital, and ruled by hereditary princes. Ludolf, the first duke, is said to have been the great-grandson of Wittekind, but nothing is certainly known of his ancestry. His second son, Otho the illustrious (880—912), was the most distinguished of the German princes; he fought valiantly against the Normans, and, on the extinction of the Carlovingian dynasty (911), refused the crown of Germany which was unanimously offered him by the electors. His son Duke Henry (912—936), surnamed 'the Fowler,' obtained the throne (919), and commenced the Saxon line of German sovereigns, which was continued by Otho I. (q. v.), Otho II. (q. v.), Otho III. (q. v.), and Henry II., and ended in 1024. Otho I., handed over the great duchy of S. to Hermann Billung in 960, on condition of military service; and this family held it till 1106. Under the Billung dynasty, the prosperity of the country greatly increased, and Meissen, Thuringia, East S., in Lusatia, S. in the Northern Mark, Anhalt, Saltzwedel, and Siesvig, were all dependent on the Saxon duke. A portion of S. had, however, been reserved by the emperor, Otho I., for his nephew Bruno, who founded a lordship of Saxony-Brunswick; and, in the middle of the 11th c., a duchy of 'Saxony on the Weser' was also founded; but both of these (united by marriage in 1090 or 1096) came (1113) by marriage to Count Lothar of Supplinburg, who was also invested (1106) with the great duchy of S., which was now more extensive than ever, stretching from the Unstrut, in Gotha, to the Eider, and from the Rhine to Pomerania.

After Lothar's accession to the imperial throne in 1125, he handed over (1127) the duchy to his son-in-law, Henry the Proud, the Guelphic Duke of Bavaria, who was thus the ruler of more than half of Germany; but this overgrown dominion did not long exist, for under his son, Henry the Lion (q. v.), it was wrested (1180) from the House of Guelph, Bavaria being given to the House of Wittelsbach; East Saxony created an electorate, and given to Bernhard of Ascania; Brunswick and Luneburg mostly restored to Henry's son; while the numerous and powerful bishops of Northern Germany divided among themselves Westphalia, Oldenburg, and many portions of Luneburg and Brunswick; Mecklenburg and Holstein became independent, and the Saxon palatinate in Thuringia went to the Landgraf Ludwig. S., now shorn of its former greatness, consisted chiefly of what is now Prussian S., a few districts separated from Brandenburg, and Saxe-Lauenburg, the last being the only portion of the great duchy of S., or *Lower Saxony*, as it is called, which retained the name. Wittenberg was the capital of the new duchy. S. was diminished in 1211 by the separation of Anhalt as a separate principality; and in 1260 it was permanently divided into two portions, *Saxe-Lauenburg* and *Saxe-Wittenberg*, to the latter of which the electoral dignity remained, and to which, on subsequent dispute between the two branches, it was confirmed by the celebrated Golden Bull (1356). The Ascanian line became extinct in 1422 with Duke Albert III., and the duchy then passed to Frederick the Warlike, Markgraf of Misnia, and Landgraf of Thuringia, who was invested with it by the Emperor Sigismund in 1423. His possessions consisted of Thuringia, the present kingdom of S., Prussian S., in fact, the whole of *Upper Saxony*, with the exception of Anhalt.

History of the Country now known as Saxony.—The earliest inhabitants of Upper S., since the Christian era, were the Hermunduri (see THURINGIA); and on the destruction of the great Thuringian kingdom in the beginning of the 6th c., their settlements were taken possession of by the Sorbs, a Slavic race, who practised agriculture and cattle-breeding. The Carlovingian rulers, dissatisfied with the ingress of those non-German tribes, erected 'marks' to bar their progress; and Duke Otho the Illustrious of S., and his celebrated son, Henry the Fowler, warred against them, the latter—subduing the Heveller, the Daleminzer, and the Miltzer—founded in their country the marks of Brandenburg (q. v.), Misnia (Meissen), and Lusatia (Lausitz), and planted colonies of Germans among the Sorbs. In 1090, the mark was bestowed on the House of Wettin (a supposed off-shoot of the race of Witte-kind), and was confirmed as a hereditary possession to that family in 1127; and the markgraf, Henry the Illustrious (1221—1288), whose mother was heiress to the landgrafdom of Thuringia, with its appendages, combined the whole into a powerful state. Business, commerce, and mining industry now flourished; great roads for commercial purposes were constructed throughout the country, and the Leipzig fairs were established; and, in spite of much internal discord, and frequent partitions of S., its prosperity increased. At last, FREDERICK THE WARLIKE (1381—1428) succeeded in uniting the severed portions of S., to which were added, by purchase and marriage, various districts in Franconia; and in 1423, the electorate of S. (see above). The Saxon elector was now one of the most powerful princes of Germany; but unfortunately the fatal practice of subdividing the father's territories among his sons still continued, and during the reign of the Elector FREDERICK THE MILD (1428—1464), whose brother William had obtained Thuringia, a civil war broke out, and was carried on for years. ERNEST (1464—1486) and ALBERT (1464—1500), the sons of Frederick, in accordance with the will of their father, reigned conjointly over the hereditary domains of the family (the duchy of S., with the electoral dignity, being reserved always to the eldest) till the death of their uncle (1485), when Ernest obtained Thuringia, and Albert Meissen, while Osterland was equally divided between them.

Ernest, the founder of the *Ernestine*, which was also the *elder* or *electoral line*, was succeeded by his son, FREDERICK THE WISE (1486—1525), who favored the reformation, and firmly supported and protected Luther against the overwhelming power of the Catholic party, which he was enabled to do, from his personal influence with the Emperors Maximilian and Charles V. His brother and successor, JOHN THE CONSTANT (1525—1532), was still more a partisan of the new doctrines, as was also his son and successor, JOHN FREDERICK THE MAGNANIMOUS (1532—1547); but the latter, by the defeat of Muhlberg (q. v.) (see SCHMALKALD), was forced to resign both his electoral dignity and his states. Albert, the founder of the *younger, ducal*, or *Albertine line*, was succeeded by his sons, GEORGE THE BEARDED (q. v.) (1500—1539), a rabid Catholic, and HENRY THE PIOUS (1539—1541), a no less zealous Protestant; after whom came the celebrated MAURICE (1541—1547), who was a professed Protestant, but joined the Catholic party against the league of Schmalkald, obliged the Protestant army to retreat from the Danube, and took possession of the estates of the Elector John Frederick, who, however, speedily drove him out, and took possession of ducal S. in his turn. After the rout of the Protestants at Muhlberg, Maurice received the electoral title (1547—1553), and the greater portion of the estates of his vanquished cousin. But the arbitrary political measures and religious severities which were

either instituted or promoted by the emperor, induced Maurice to join the Protestants, and by a sudden march on Innspruck, he forced the emperor to agree to the peace of Passau. New tyrannical measures of the emperor caused him to look to an alliance with France, but the scheme was frustrated by his death, July 11, 1553, near Sievershausen, where two days before he had totally defeated the Markgraf Albert of Kulmbach, a secret agent of the emperor's. His brother, AUGUST I. (q. v.) (1553—1586), the first economist of the age, has left a memory dear to S., from the numerous excellent institutions which he established; he considerably increased his territories by purchase and otherwise, and restored Altenburg to the Ernestine line.

CHRISTIAN I. (1586—1591), a weak prince, surrendered the reins of government to his chancellor, Crell, who was sacrificed, in the succeeding reign of CHRISTIAN II. (1591—1611), to the revenge of the offended nobility. Christian II. weakly neglected to assert his claims to Juliers, on the death of its last duke, and allowed it to become a prey to Brandenburg and the palatine House of Neuburg; but his brother JOHN GEORGE I. (1611—1656), in revenge for this spoliation, allied himself to Austria, and conquered Upper and Lower Lusatia and Silesia. Subsequently, the good understanding between these powers was destroyed, and the elector allied himself with Gustavus Adolphus (1631), and took part in the Thirty Years' War. But on the death of Gustavus, the elector separated from the Swedes, and made a separate peace (1635) with Austria, by which he obtained Upper and Lower Lusatia, acquisitions confirmed by the general treaty of Westphalia (1648). This was the period of the electorate's greatest power. His sons, JOHN GEORGE II. (1656—1680), August, Christian, and Maurice, divided the estates, the three latter founding cadet lines, all of which became extinct before 1750. The reigns of his successors, JOHN GEORGE III. (1680—1691) and JOHN GEORGE IV. (1691—1694), are unimportant, but that of FREDERICK AUGUST I. (q. v.) (1694—1733) well-nigh ruined the hitherto prosperous electorate. Frederick August had been chosen king of Poland; and his attempt, in company with the czar and the king of Denmark, to dismember Sweden, brought down upon him and his two states the vengeance of the northern 'fire-king.' Poland was utterly devastated, and S. exhausted of money and troops. Besides, the king's habits were most extravagant, and to maintain his lavish magnificene, he was forced to sell many important portions of territory. FREDERICK AUGUSTUS II. (q. v.) (1733—1763), also king of Poland took part in the war of the Austrian Succession (q. v.) against Maria Theresa, but finding the treaty of Berlin (1742) not so satisfactory for himself as he expected, he joined the empress in 1745. The country was atrociously ravaged during the Seven Years' War (q. v.), and a long time elapsed before it recovered its previous peaceful and prosperous state.

FREDERICK CHRISTIAN (1763—1763) and FREDERICK AUGUST I. (1763—1827), labored zealously for the good of their subjects; and under the reign of the latter, agricultural, manufacturing, and industrial enterprise progressed with rapid strides. In spite of his love for peace, the elector was led into the quarrel respecting the Bavarian Succession (q. v.); but he refused the crown of Poland in 1791, and declined to take part in the convention of Pilnitz, though he joined the Prussian confederation of German princes, and had an army of 22,000 Saxons at the battle of Jena. But the pressure of the French compelled him to join the Confederation of the Rhine in 1806, and from this time his army fought side by side with the French. He obtained the union to S. of the duchy of Warsaw (see POLAND), but fearing that the disasters of the French, in 1812, would be fatal to their supremacy, and to the interests of S., he withdrew to Bavaria, and thence to Prague, renounced the duchy of Warsaw, and made every attempt to come to amicable terms with the allies. But he was again compelled to join the French, between the battle of Lutzen (May 2, 1813), and that of Leipzig (October 16—19, 1813), after which he became the prisoner of the allies, and his army was joined to theirs. For his support of Napoleon, he was deprived of the greater portion of S., which was handed over to Prussia, but he retained the title of king, which had been conferred upon him in 1806. The rest of his reign was occupied with internal reforms. ANTONY (1827—1836) reformed the entire legislation of the country, and granted a liberal constitution, being urged thereto by a popular outbreak in the autumn of 1831. The constitution was proclaimed September 4, 1831, and the state's representatives first assembled, January 27, 1833. FREDERICK AUGUST II. (1836—1854), his nephew, who had been regent for several years, now succeeded, and though favorable to constitutionalism, he was unable to obtain the smooth and harmonious working of the new system. In 1843, violent contests commenced, accompanied by occasional riots in the principal towns, on the subject of the liberty of the press, and the publicity of legal proceedings. Sometimes the constitutionalists, and sometimes their opponents, gained the supremacy, and for a long time the efforts of the two parties counteracted each other. Towards the close of the king's reign, he was a mere tool in the hands of the reactionary party, headed by his brother JOHN, who succeeded in 1854. John, however, supported constitutionalism, and established courts of justice throughout the kingdom. For the hostile attitude assumed by S. towards Prussia before 1866, and its subsequent history, see GERMANY.

SAXONY, PRUSSIAN, the most westerly undetached province of Prussia, bounded on the E. and N.-E. by the province of Brandenburg. Area, 9730 sq. miles; pop. (1880) 2,312,007. The west districts are occupied by the Harz Mountains, and the peak of the Brocken (3738 feet high) is the chief elevation. The greater portion of the surface, however, is level, and slopes towards the north, in which direction flow the principal rivers—the Elbe, with its tributaries, the Saale and Mulde. The climate is mild and healthy, and the soil is exceedingly fertile and well cultivated. More than the half of the area is under crop, and nearly $\frac{2}{5}$ths are uncultivated, and in water and wood. The *Goldene Aue*, in the south-west, is especially famous for its abundant fertility. Manufacturing industry is most actively carried on, and there are spinning, weaving, and oil-mills in great numbers. The capital is Magdeburg (q. v.). The larger portion of Prussian S. (7911 sq. m.) was detached from the kingdom of Saxony, and ceded to Prussia, by decree of the Congress of Vienna, 1815. See SAXONY.

SAY, JEAN BAPTISTE, an eminent French economist, was born at Lyons, 5th January 1767. Being destined by his father for a commercial career, he passed a part of his youth in England; and on his return to France, obtained a situation in a Life Insurance Company, about which time he made his first acquaintance with the works of Adam Smith. During the Revolution, he was for some time secretary to Clavière, the Minister of Finance; and from 1794 to 1800 edited a journal called *La Décade*, in which he expounded with great effect the views of Smith. Already S. had acquired a distinguished reputation as a thinker by his *Traité d'Economie Politique, ou Simple Exposé de la Manière dont se forment, se distribuent et se consomment les Richesses* (Paris, 1803), and other works. Called to the tribunate in November 1799, he was not slow to express his disapprobation of the arbitrary tendencies of the new consular government, and in 1804 he ceased to be a member of a body that had become a mere tool in the hands of Bonaparte.

Under the despotism of the Empire, S. was forced into private life, and betook himself to industrial pursuits, establishing (along with his son) at Auchy a large spinning-mill, which soon employed not less than 500 workmen; and when Bonaparte fell, S. found himself at the head of the economical and commercial movement that marked the epoch. In 1814, the second edition of his now celebrated *Traité* appeared, dedicated to the Emperor Alexander, who had long called himself his 'pupil;' and in the same year the French government sent him to England to study the economical condition of that country. In 1819, a new chair, that of *Economie Industrielle*, was created for him at the *Conservatoire des Arts et Métiers;* and S. added both to his influence and his popularity by the lucidity, grace, and intensity of conviction displayed in his lectures. In 1831, he was appointed Professor of Political Economy at the *Collége de France*, but died 15th November 1832. Although strictly a follower of Adam Smith, S. is an independent, sagacious, and penetrative thinker. Ricardo speaks of his works as containing 'several accurate, original, and profound discussions.' He was the first to teach Frenchmen to consider rationally such questions as customs-duties, the currency, public credit, the colonies, and taxation; and though the brilliant socialistic theorizers say that he is not an *economiste spiritualiste*, many will consider that defect a merit. Besides his *chef-d'œuvre* already mentioned, S. wrote (among other works) *De l'Angleterre et des Anglais* (Par. 1812), *Catéchisme d'Economie Politique* (Par. 1815), *Lettres à Malthus* (Par. 1820), *Cours Complet d'Economie Politique* (Par. 1828—1830), and *Mélanges et Correspondance* (Par. 1833). His principal writings form vols. 9—12 in Guillaumin's *Collection des Economistes.*

SCAB, in Sheep, like itch in man, or mange in horses or dogs, depends upon the irritation of a minute acarus, which burrows in the skin, especially if dirty and scurfy, causing much itching, roughness, and baldness. The parasite readily adheres to hurdles, trees, or other objects against which the affected sheep happen to rub themselves, and hence is apt to be transferred to the skins of sound sheep. Chief amongst the approved remedies are diluted mercurial ointments, tobacco-water, turpentine and oil, and arsenical solutions, such as are used for sheep-dipping. One of the best and simplest applications consists of a pound each of common salt and coarse tobacco, boiled for half an hour, in about a gallon of water; to this are added two drachms of corrosive sublimate; and the mixture diluted until it measures three gallons. For each sheep, a pint of this mixture should be carefully applied, from a narrow-necked bottle, along the back, and to any other scurfy itchy parts. A second dressing, after an interval of a week, will generally effect a perfect cure.

SCA'BBARD is the sheath for a sword or bayonet, at once to render the weapon harmless and to protect it from damp. It is usually made of black leather, tipped, mouthed, and ringed with metal; but the British cavalry wear scabbards of steel. These better sustain the friction against the horse's accoutrements, but are objectionable from their noisiness, and the consequent impossibility of surprising an enemy. The sword-scabbard is suspended to the belt by two rings; the bayonet-scabbard hooks into a frog in connection with the waist-belt.

SCABE'LLUM, a kind of pedestal to support busts.

SCA'BIES. See ITCH.

SCA'BIOUS (*Scabiosa*), an extensive genus of herbaceous plants, exclusively natives of the eastern hemisphere, of the natural order *Dipsacaceæ*. See TEASEL. The flowers are collected in terminal heads, surrounded by a many-leaved involucre, so as to resemble those of the order *Compositæ*. The DEVIL'S-BIT S. (*S. succisa*) is a very common autumnal flower in British pastures. The plant possesses great astringency, but no important medicinal virtues; although it was formerly supposed to be of great efficacy in all scaly eruptions, and hence the name S., from Lat. *scabies*, leprosy. The end of the root appears as if abruptly bitten off, and the superstition of the middle ages regarded it as bitten off by the devil, out of envy, because of its usefulness to mankind! The SWEET S. (*S. atropurpurea*) is a well-known fragrant garden-flower. It is supposed to be a native of India.

SCAD (*Caranx trachurus* or *Trachurus vulgaris*), a fish of the family *Scomberidæ*, sometimes called the *Horse Mackerel*, because of its resemblance to the mackerel, and its comparative coarseness. It is from 12 to 16 inches long, of a dusky olive color, changing

Scad (*Caranx trachurus*).

to a resplendent green, waved with a bluish gloss, the head and lower parts silvery, the throat black. There are two small free spines in front of the anal fin. The species of *Caranx* are very numerous, and it is sometimes divided into several genera; but the S. is the only one found on the British coasts. It is common on the south-western coasts of England, but comparatively rare to the north. It sometimes appears in immense shoals, pursuing the fry of herring or similar prey, and the multitudes have sometimes been so great and so crowded together, that they could be lifted out of the sea by buckets, and overloaded nets have been torn to pieces. The S. has something of the mackerel flavor. Although not much cared for when fresh, it is often salted, and in that state is esteemed as an article of food.

SCA'FELL, a double-peaked mountain in Cumberland, on the Westmoreland border, 13 miles south-south-west of Keswick, is a chief feature in the scenery of the Lake Country, in the heart and center of which it stands. Of its two peaks, the higher is 3229 feet, the other 3092 feet in height.

SCAGLIO'LA, a composition made to imitate the more costly kinds of marble, and other ornamental stones; and so successfully is it done, that it is often difficult to distinguish between the artificial and the real stone. It consists of finely ground plaster of Paris mixed with a thin solution of fine glue, and colored with any of the earthy colors, such as ochres, umber, Sienna earth, Armenian bole, and sometimes chemical colors, such as the chrome yellows, &c. This is spread over the surface intended to represent marble; and whilst still soft, pieces of fibrous gypsum, marble, alabaster, and other soft but ornamental stones, are pressed into it, and made level with the surface. When the composition is set hard, it is rubbed down, and polished with the ordinary stone-polishing materials, which give it a very fine gloss. This kind of work is only adapted for interiors, because scagliola will not bear exposure to damp for any length of time; but its lightness, and the extreme ease with which it may be applied to walls, pillars, plasters, and even cornices, render it very useful for the decoration of the better class of dwellings and public buildings.

SCA'LA NO'VA, a seaport of Asiatic Turkey, stands on an eminence at the head of a gulf of the same name, 40 miles south of Smyrna. The ruins of the ancient city of Ephesus (q. v.) are in the vicinity. An important export trade is carried on. Pop. stated at 20,000. The Gulf of S. N., confined on the south by the island of Samos, is 40 miles long, and about 20 miles broad.

SCALD-HEAD (a corruption probably of *Scaled Head*) is the popular name of a fungous parasitic disease of the scalp (and occasionally of the face and other parts), known in medical phraseology as *Favus*, *Tinea favosa*, and *Porrigo scutulata*. The primary seat of the parasite is in the lowest portion of the hair-follicles, outside the layer of epithelium which covers the root of the hair. The plant is, however, often found in cup-shaped depressions on the surface of the scalp, forming the yellow honeycomb-like masses which suggested the specific name *Favus* (honeycomb) for the disease. The honeycomb crust continues to increase, preserving its circular form and depressed center, till it occasionally reaches a diameter of nearly half an inch. These crusts commonly appear in crops, and may be either distinct or confluent. 'At a more advanced stage,' says Dr. Aitken, 'the epidermis disappears, and a viscid fluid is secreted in such abundance as to form one entire incrustation over the entire head; hence the *Porrigo larvalis*—mask or visor-like scald-head. The smell of the scab is peculiar, and has been compared to that of the urine of a cat, or of a cage in which mice have been kept. It is probably due to a species of alcoholic fermentation in connection with the vegetable growth.' The scab sometimes resembles a lupine, or a minute shield, rather than the cell of the honeycomb, and hence the varieties of scald-head which have been described under the name of *Porrigo lupinosa* and *Porrigo scutulata*.

Scald-head:
A, A, chains of sporules projecting beyond the edges of the hair; B, sporules between the fibres of the hair; C, D, broken-up root end of the hair, with masses of sporules between the laminæ.

The great point to be aimed at in the treatment of this affection is to destroy the cryptogamic parasite, and to eradicate its germ. For this purpose, the head should be shaved, and poultices then applied till the scabs are removed. Tar-ointment should then be applied, night and morning, the old ointment being washed off with soft soap and water before the fresh dose is laid on. Dr. Aitken states, that in the early stage of the disease, in place of the preceding treatment, it is sometimes sufficient to cut the hair close, and to wash the affected parts, night and morning, with oil of turpentine. If the disease does not yield to these applications, the same treatment as that recommended for RINGWORM must be tried.

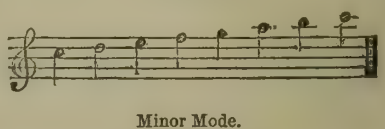
SCALDS. See BURNS.

SCALE-ARMOR consisted of small plates of steel riveted together in a manner resembling the scales of a fish. From the small size of the plates, it possessed considerable pliability, and was therefore a favorite protection for the neck, in the form of a curtain hanging from the helmet. Scale-armor is now obsolete, except, perhaps, among some eastern potentates.

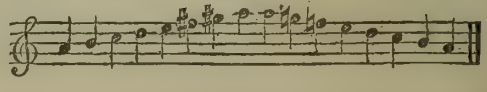
SCALE INSECT. See COCCUS.

SCALE, MUSICAL, a succession of notes arranged in the order of pitch, and comprising those sounds which may occur in a piece of music written in a given key. The ultimate criterion of what should constitute a musical scale, is doubtless what gives most pleasure to a cultivated ear; but the sounds that please the ear are also found to be those that stand in certain simple mathematical relations to each other. Among the ancient Greeks, various different scales or *modes* were in use, of which six were generally enumerated—the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionic, and Æolian. Excepting in the music of the Greek Church and

Major Mode.



Minor Mode.



of the Ambrosian Chant, modern musical feeling has rejected all of these but two, the Ionic and the Æolian, the former of which is now known as the Major, and the latter the Minor Mode. In both modes, the scale consists of a series of seven steps leading from a given note fixed on as the tonic or key-note to its octave,

which may be extended indefinitely up or down, so long as the sounds continue to be musical.

For an explanation of the principles on which these scales are founded, and of their derivation from the harmonic triad, see MUSIC. The major scale is derived from much simpler proportions than the minor. The minor scale requires to be modified by occasionally sharpening its sixth and seventh.

SCALES OF FISHES. They are divided by Agassiz, whose classification is generally adopted, into the *placoid*, *ganoid*, *ctenoid*, and *cycloid* forms. *Placoid* scales (from the Gr. *plax*, a broad plate) lie side by side without overlapping or imbricating. They are often elevated at the center so as to form a strong projecting point. All the cartilaginous fishes, except the sturgeon, have placoid scales. *Ganoid* scales (from the Gr. *ganos*, splendor) are covered with a fine enamel, and generally of a rhomboidal form and imbricated. The sturgeon and the bony pike (*Lepidosteus*)

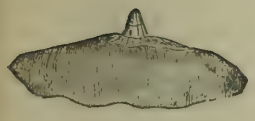


Fig. 1.—Placoid Scale.

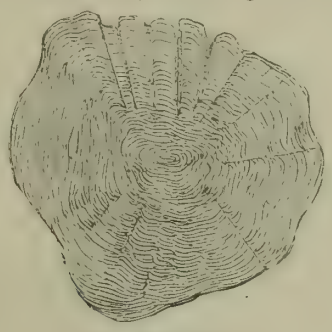

Fig. 2.—Cycloid Scale.

have scales of this nature, but the finest examples of these scales are found in fossil fishes. *Ctenoid* scales (from *kteis*, a comb) are generally of a rounded or oval form, with teeth or projections on their posterior margin. They are devoid of enamel, and present an imbricated arrangement. The perch and many osseous fishes possess these scales. *Cycloid* scales (from the Gr. *kyklos*, a circle) consist of concentric layers of horn or bone, without spinous margins, and not covered by enamel. They are soft and flexible, present a variety of linear markings on their upper surface, and usually exhibit an imbricated arrangement. The carp, herring, salmon, &c., possess these scales. In many cases, two kinds of scales occur in the same fish, while in other cases the different species of a single genus exhibit different kinds of scales.

For anatomical details regarding the structure and mode of development of scales, the reader is referred to Professor Huxley's article 'Tegumentary Organs' in the *Cyclopædia of Anatomy and Physiology*, and to Professor Williamson's Memoirs in the *Philosophical Transactions*, 1849—1852. In their chemical composition, the scales of fishes approximate to the bones, except that they contain more organic matter. The brilliancy of tint exhibited by many fishes is due apparently to the phenomena of optical interference, rather than to the presence of coloring matter. Figures of Ctenoid and Ganoid Scales are given in the articles CTENOID FISHES and GANOID FISHES.

SCALES OF NOTATION are the various 'radices' which determine, as explained under NOTATION (q. v.), the form and digits of the number expressing any numerical quantity. Thus, the number 289, in the decimal or common system whose radix is 10, signifies 9 units, 8 tens, and 2 hundreds, or $2 \times 10^2 + 8 \times 10 + 9$. To express the same number in the quinary scale, for instance, we must group the 289 units into multiples and powers of 5; an operation which may be performed in either of two ways, as follows:

5)289	289	2124 (quinary)
5)57-4	10	5
5)11-2-4	103 (taking in 8, and	11 (carrying by 10)
2-1-2-4	10 carrying by 5)	5
	2124	57
		5
		289

or 2124 (i. e., $2 \times 5^3 + 1 \times 5^2 + 2 \times 5 + 4$) in the quinary scale represents the same numerical quantity as 289 in the decimal scale. The following list shows the same numerical quantity according to the scales having for their radices the first 11 numbers after unity, and will partly indicate the advantages and disadvantages of each scale:

In the *binary*	(*radix* 2) scale	.....	100,100,001
" ternary	(" 3) "	.....	101.201
" quaternary	(" 4) "	.....	10.201
" quinary	(" 5) "	.....	2,124
" senary	(" 6) "	.....	1,201
In the septenary	(*radix* 7) scale	.....	562
" octary	(" 8) "	.....	441
" nonary	(" 9) "	.....	351
" decimal	(" 10) "	.....	289
" undenary	(" 11) "	.....	243
" duodecimal	(" 12) "	.....	201

It will be observed that the binary scale possesses only two symbols, 0 and 1, the ternary has 3, while the undenary would require a symbol in addition to the 9 digits and zero to express 10, which is a digit in that scale, and the duodecimal scale two additional symbols for 10 and 11. A glance at the above table shows at once that if the binary scale had been in ordinary use, great facility in the 'performance' of arithmetical operations would have been obtained at the cost of largely increasing their 'extent,' and that both the advantage and disadvantage diminish as we raise the scale. The selection of 'ten' as the ordinary scale is very prevalent, and was evidently suggested by the number of fingers; but the scales of two, three, four, five, six, and twenty, have at various times been made use of by a few nations or tribes. The scale of 12 has long been generally employed in business among northern European nations, as is instanced by such terms as 'gross,' signifying 12 times 12, and 'double gross,' denoting 12 times 12 times 12; and it has also been largely introduced into the standard measurements of quantity, as inches, pence, ounces, troy, &c., causing a considerable amount of complexity in calculation, as all abstract numerical calculation follows the decimal system. To remedy this acknowledged evil, it has been proposed to introduce the decimal system *in toto*, as has been done in France, Italy, Russia, &c., or else to do the same with the duodecimal system. Those who hold to the first proposal have the argument of conformity in their favor; those who support the latter do so on the ground, that 12 has in proportion far more aliquot parts than 10 has, and that on this account the number of fractions, and the size of each numerator and denominator, would be diminished; while both parties can bring overpowering arguments against the continuance of the present method, or rather want of method. See DECIMAL SYSTEM.

SCALIGER, JULIUS CÆSAR, one of the most famous men of letters that have appeared since their revival, was born in 1484. In after-life, he created for himself a noble pedigree, and made out that he was descended from a princely family of the Scalas of Verona, and that his birthplace was the castle of Riva, on the banks of the Lago di Guarda. According to his own account, he was educated first under the famous Fra Giocondo; was afterwards attached as a page to the Emperor Maximilian, whom he attended for 17 years in peace and war; was next made a pensioner of the Duke of Ferrara; thereafter studied at Bologna; commanded a troop of cavalry at Turin under the French viceroy; prosecuted his studies there in philology, philosophy, and medicine; and in 1525 went to Agen, in France, with the bishop of that diocese, a member of the Rovere family, to whose household he became physician. Tiraboschi's account, however, which is the more probable, represents him as having been born at Padua, the son of Benedict Bordoni, who was a geographer and miniature-painter of that city, and who either from the sign of his shop or the name of the street he lived in, assumed the surname Della Scala. Up to his 42d year, young Giulio Bordoni resided chiefly in Venice or Padua, engaging in the study and practice of medicine, and appearing under his true name as an author. In 1525, he withdrew to Agen, either from some advantageous offer, or with a view to promote his fortune, and there fixed his abode. He became physician to the bishop of the diocese, and in that capacity sought in marriage Andietta de Roques-Lobejac, a young lady only 16 years of age, and of noble and rich parentage. An obstacle was thrown in the way of this alliance; and probably with the purpose of improving his position, and lessening the disparity in station between himself and the object of his affections, he procured, in 1528, letters of naturalization as a French subject under the name of Jules-César de Lescalle de Bordonis. This was probably the occasion when he added Cæsar to his baptismal name of Julius. The marriage took place in 1529, and was both happy and fruitful. He died in 1558, leaving behind him a mass of publications on various subjects, and a reputation for extent and depth of learning, which, considering the ripe age at which he made the majority of his acquirements, redounds to the credit of his vigorous understanding and extraordinary memory.

As a thinker, he was more independent that sound; and as a man, was of violently irritable temper and excessive vanity. His best known publications are *Commentarii in Hippocratis Librum de Insomniis* (Commentaries on the Hippocratic Treatise on Dreams); *De Causis Linguæ Latinæ Libri XVIII.*, celebrated as the first considerable work written in the Latin language in modern times, and not without value even yet; his Latin translation of Aristotle's *History of Animals;* his *Exercitationum Exotericarum liber quintus decimus de Subtilitate ad Hieronym. Cardanum;*

his seven books of *Poetics* (also in Latin, and on the whole his best work); his *Commentaries on Aristotle and Theophrastus;* his two orations against Erasmus; his Latin poems, &c.

SCALIGER, JOSEPH JUSTUS, the tenth son of J. C. Scaliger and Andietta de Roques-Lobejac, and much his father's superior in learning, was born in 1540 at Agen, whence, at the age of 11, he was sent, along with two of his brothers, to the college of Bordeaux, where for three years he studied Latin. A pestilence breaking out in the town, he was recalled by his father, who supplemented the scanty knowledge which his son brought home with him by making him write a Latin declamation every day upon any subject he chose. Under this training, he soon attained great proficiency as a Latinist; and in his 19th year, on the death of his father, he went to Paris, where he studied Greek under the famous Turnebus. He was less indebted, however, to any master than to himself; and finding that his progress was slow under his great preceptor, he closeted himself alone with Homer, and in 21 days read him through, with the aid of a Latin translation, and committed him to memory. In less than four months, he had mastered all the Greek poets. Next, Hebrew, Syriac, Persian, and the most of the modern European languages succumbed in rapid succession to his industry, while at the same time he was assiduous in his composition of verses both in Latin and Greek. About this time, he boasted that he could speak 13 languages, ancient and modern; and such was his ardor in study, that he allowed himself only a few hours' sleep at night, and would frequently pass whole days without rising from his books even for meals.

His proficiency in literature, especially in the history, chronology, and antiquities of Greece and Rome, secured him, in 1583, an honorable engagement from Louis de la Roche Pozay, at that time French ambassador at the pontifical court. The year, before, however, he had become a Protestant, which rendered it difficult for him to retain an appointment in France. Except that he traveled a good deal, at the generous instance of his patron, and visited the chief universities of France and Germany, and even found his way to Scotland, we know little of his life between 1565 and 1593. He is conjectured to have traveled in Italy, and to have gone as far as Naples. Certain it is, however, that in the year last named he complied with an invitation of the Dutch government, and went to fill the chair of Literature, vacated by Lipsius in Leyden University, where he spent the residue of his days. His labor now consisted chiefly in interpreting and illustrating the classical authors. He died of dropsy on the 21st January 1609, and was never married. We have said that he far excelled his father in learning; but it should be added that he was not a whit less irritable, arrogant, or vain; that he fully shared the paternal pride of pedigree, spurious as he probably knew his own to be; and that he endeavored to support his father's genealogical fictions in his well-known letter to Dousa on the splendor of the Scaliger family. His writings abound with expressions of hatred and contempt towards his opponents, and he has enriched the vocabulary of learned abuse to an extent well nigh proverbial. He was, however, a man of immense vigor of understanding, and must be credited with having been the first to lay down, in his treatise *De Emendatione Temporum* (Paris, 1583), a complete system of chronology formed upon fixed principles. It was this most learned achievement, and his invention of the Julian period, that secured for him the title of the Father of Chronological Science. It was subjected to much emendatory criticism by censors like Petavius, and also by himself, its errors having been partly corrected by him in his later work, the *Thesaurus Temporum, complectens Eusebii Pamphili Chronicon cum Isagogicis Chronologiæ Canonibus* (Amst, 1658, 2 vols. fol.).

Among the classical authors whom he criticised and annotated are Theocritus, Seneca (the tragedies), Varro, Ausonius, Catullus, Tibullus, Propertius, Manilius, and Festus. His other works are *De Tribus Sectis Judæorum; Dissertations on Subjects of Antiquity; Poemata; Epistolæ;* a translation into Latin of two centuries of Arabian proverbs, &c. He numbered among his friends the most illustrious scholars of the time, such as Lipsius, Casaubon, Grotius, Heinsius, the Dupuys, Saumaise, Vossius, Velser, P. Pithou; and interesting notices of him are preserved in such works as the *Huetiana*, and above all, in the two vols. of *Scaligerana*, which embody his conversations, and which were collected and published after his death.

SCA'LLOP, more commonly ESCALOP (q. v.), in Heraldry, a species of shell. It has been considered the badge of a pilgrim, and a symbol of the apostle St. James the Greater, who is usually represented in the garb of a pilgrim.

SCALLOP-SHELL. See PECTEN.

SCALP, THE, is the term employed to designate the outer covering of the skull or brain-case. Except in the fact, that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs so slightly from ordinary skin that it is unnecessary to enter into any details on this point. But besides the skin, the scalp is composed of the expanded tendon of the occipito-frontal muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be watched with great caution, 'for they may be followed by erysipelas, or by inflammation and suppuration under the occipito-frontal muscle, or within the cranium, or by suppuration of the veins of the cranial bones, and general pyæmia that may easily prove fatal.'—Druitt's *Surgeon's Vade Mecum*, 8th edition, p. 332. In the treatment of a wound of this region, no part of the scalp, however injured it may be, should be cut or torn away; and, if possible, the use of stitches should be avoided, as plasters and bandages will generally suffice to keep the separated parts in apposition. The chance of suppuration may be prevented by coagulating the blood externally, by dressing the wound with lint, saturated with *Friars' Balsam* (*Tinctura Benzoin Comp.*), so as to seal up the injured part from the access of air. The patient should be confined to the house (and in severe cases to bed), should be moderately purged, and fed upon non-stimulating, but not too low diet.

Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases.

Tumors of the scalp are not uncommon, the most frequent being the cutaneous cysts popularly known as *Wens* (q. v.), and vascular tumors.

SCAMA'NDER, the ancient name of a river in the Troad (see TROY), which, according to Homer, was also called Xanthus (Gr. yellow) by the gods, and as a divinity took an important part in the Trojan war, its destructive floods doing serious injury to one party, and thus materially assisting the other. The S. rose in Mount Ida (q. v.), and, flowing west and north-west, discharged itself into the Hellespont, after being joined by the Simois, about two miles from its mouth: the two rivers, however, since the 1st c. A.D., have had separate courses. There has been much controversy as to what modern river corresponds to the ancient S.; Mr. C. Maclaren, in his *Plains of Troy*, has clearly identified it with the Mendere.

SCAMI'LLUS, a small plinth below the bases of Ionic, Corinthian, and other columns.

SCA'MMONY is a gum-resin of an ashy-gray color, and rough externally, and having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which, when pure, contains from 81 to 83 per cent. of resin (which is the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fibre, and water. The ordinary adulterations are chalk, flour, guaiacum, resin, and gum tragacanth.

Scammony, when pure, is an excellent and trustworthy cathartic of the drastic kind, well adapted for cases of habitual constipation, and as an active purgative for children. The resin of scammony, which is extracted from the crude drug by rectified spirit, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The *Scammony Mixture*, composed of four grains of resin of scammony, triturated with two ounces of milk, until a uniform emulsion is obtained, forms an admirable purgative for young children in doses of half an ounce or more. According to Christison, 'between 7 and 14 grains of resin, in the form of this emulsion, constitute a safe and effectual purgative' for adults. Another popular form for the administration of scammony is the *Compound Powder of Scammony*, composed of scammony, jalap, and ginger, the dose for a child being from 2 to 5 grains, and for an adult from 6 to 12 grains. Scammony is frequently given surreptitiously in the form of biscuit to children troubled with thread-worms.

The plant which produces this valuable drug is *Convolvulus Scammonia* (see CONVOLVULUS), a native of the Levant. It is a perennial, with a thick fleshy tapering root, 3—4 feet long, and 3—4 inches in diameter, which sends up several smooth slender twining stems, with arrow-head-shaped leaves on long stalks. The root is full of an acrid milky juice, which indeed pervades the whole plant. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air.

The name *French* or *Monpelier Scammony* is given to a substance which is prepared in the south of France, chiefly from the juice of *Cynanchum Monspeliacum*, a plant of the natural order *Asclepiaceæ*. It is a violent purgative.

SCA'NDALUM MAGNA'TUM. This offence was committed in speaking words in derogation of a peer, judge, or great officer of the realm, and a special action was brought for such words, the punishment being damages and imprisonment. But now this proceeding, though not expressly abolished, is superseded by the ample remedies of Criminal Information (q. v.), indictment, or

action. A somewhat similar offence in Scotland is called Leasing-making (q. v.).

SCANDERBEG (properly, *Iskander-beg*, 'the Prince Alexander,' the name given him by the Turks), the famous patriot chief of Epirus, was born in that country in 1414. His real name was George Castriota, and his father, John Castriota, was one of the great lords of Epirus, his mother, Voisava, being a Servian princess. In 1423, he was given as one of the hostages for the obedience of the Albanian chiefs, and his physical beauty and intelligence so pleased Amurath II., that he was lodged in the royal palace, and subsequently circumcised and brought up in Islamism, being also put under the tuition of skilful masters in the Turkish, Arabic, Slav, and Italian languages. In 1433, he greatly distinguished himself in Asia as a Turkish pasha (of one tail); but being offended at the confiscation of his paternal domains, and being solicited by some Epirote friends to return to his native country to aid in the restoration of its independence, he watched an opportunity of withdrawing from the Turkish army. He had not long to wait, for the generous and unsuspicious sultan, who had caused him to be brought up as if he had been his own son, gave him the command of a large division of the army which was destined to act against the Hungarian invaders. S., having concerted his plans with 300 of his fellow-countrymen in the Turkish army, deserted during the confusion of the first battle (1443), and having previously compelled Amurath's secretary (whom he afterwards murdered to avoid detection) to prepare an order investing him with the government of Croia (now *Ak-hissar*), the capital of Epirus, he and his companions fled thither with all possible speed. The unsuspecting governor at once resigned the town into his hands, and was massacred along with the garrison.

At the news of S.'s success, the whole country rose in insurrection, and in 30 days he had driven every Turk, except the garrison of Sfetigrad, out of the country. In order to strengthen himself in his new position, he invited a number of the neighboring princes and Albanian chiefs to a conference, at which it was unanimously agreed to make no terms with the Turks, and to obey S. implicitly as their leader. S. then raised an army of 15,000 men, with which he completely scattered (1444) the 40,000 Turks whom the indignant sultan had sent against him, killing an immense number of them, and taking a few prisoners. Three other Turkish armies shared the same fate, and the 'animus' with which the contest was carried on may be imagined, when we consider that the number of prisoners taken in the last (1448) of these three battles amounted to *seventy-two*. Amurath himself in 1449 took the field, and stormed many of the principal fortresses, but being then ill of his fatal malady, he retired from before Croia, to die at Adrianople (1450). S.'s splendid successes brought in congratulations from the pope and the sovereigns of Italy and Aragon, but many of the Epirote chiefs were becoming wearied of the continual strife, and fell off from him, some of them even joining the Turks. S.'s career was now, in consequence, of a more chequered character, but in spite of occasional defeats, he stoutly refused all the liberal and fair proposals of the sultan, Mohammed II., who had a profound admiration for him, and sheltered by the montainous nature of the country, carried on an unceasing warfare. At last an armed convention was agreed to in 1461, and S. profited by this leisure to pay off his debt to the pope and the king of Aragon (both of whom had supplied him with material assistance during his greatest need), and crossing over to Italy, he routed the partisans of Anjou, and restored the kingdom of Naples to the latter of his benefactors, returning home laden with honors and benedictions.

At the instigation of the pope, who had tried in vain to raise the other Christian princes of Europe against the Turks, S. broke the armed truce in 1464, and repeatedly defeated the Turks; but Mohammed becoming furious at these unprovoked aggressions, equipped two mighty armies, the first of which invested Croia, and the second, under his own leadership, advanced more leisurely. The first army was, after a desperate contest, defeated by S. in 1466; but the restless and indomitable chief, worn out with the incessant toil of 24 years, died at Alessio, 17th January 1467. The war continued to rage some time longer, but the great mainstay of the country was now wanting, and before the end of 1478, the Turkish standard floated undisturbed over Epirus. Barlesio, a fellow-countryman of S., who has written his biography (*De Vita et Moribus ac rebus gestis Geo. Castrioti*, Rome, 1537), remarks his sobriety, the purity of his manners, and the strictness of his religious belief. He had vanquished the Turks in 22 pitched battles.

SCANDINA'VIA, a large peninsula in the north of Europe, bounded on the N. by the Arctic Ocean; on the W. by the Atlantic, North Sea, Skager Rack, Cattegat, and Sound; and on the S. and E. by the Baltic Sea, Gulf of Bothnia and Finland, with which it is connected on the north-east by an isthmus 325 miles wide. This peninsula comprises the two kingdoms, Norway (q. v.) and Sweden (q. v.); is 1240 miles long, from 230 to 460 miles broad, area 300,000 sq. miles. The ridge of mountains which traverses the peninsula in the direction of its length gives character to the whole conformation. The western division of the Scandinavian peninsula is covered with mountains; the eastern half, Sweden, consists principally of low-lying country. The mountains of S. extend from Waranger Fiord, in the extreme north-east, to the promontory of the Naze, in the extreme south-west, with an average breadth of 180 miles. They consist principally of gneiss and micaceous schist, sometimes, but rarely, of porphyry, syenite, granite, and chalk; salt is not found; silver, copper, and iron abound.

The Scandinavian Mountains, though forming in reality one great range, are considered as forming four sections—the Lapland Mountains, in the north, from 1000 to 2060 feet high; the Kjolen Mountains, from 1500 to 2575 feet high; the Dovre Fjelde, from 2500 to 3600 feet high; and lastly, the Southern Fjelde, 4000 to 5150 feet high. Though of inconsiderable height, yet the numerous glaciers and snow-fields of the mountains of S. impart to this range almost an Alpine character. The climate of S. is much milder on the west than on the east side, a fact to be ascribed probably to the influence of the Gulf Stream. The character of the country, its physical features, industries, &c., are given under the articles NORWAY and SWEDEN.

The ancient *Scandia*, or S., included Northern Denmark, as well as the peninsula that still retains the name. It is first mentioned by Pliny, who, unaware that the peninsula was attached to Finland on the north, considered S. as an island.

SCANDINAVIAN LANGUAGE AND LITERATURE. The language which was spoken during the heathen ages in all the northern or Scandinavian lands, and which, in accordance with traditionary belief, had been introduced by Odin and his companions, when the Gothic tribes supplanted the more ancient races of the Finns and Lapps, is always referred to by the oldest authorities either as the *Dönsk túnga*, 'Danish tongue,' or as the *Norræna*, 'Norse.' We never hear of the 'Swedish' or 'Gothic tongue,' and although different dialects no doubt existed from a very early period, among the Scandinavian people, it is certain that substantially the same language was spoken by the Northmen generally till the 11th century.

According to recent inquirers, the race of the Northmen, before their settlement in Sweden and Norway, was divided into an eastern and western branch, the former of which is supposed to have used the old language of Norway and Iceland, and the latter the Swedish and Danish dialects. These two divisions of the race had entered Scandinavia by different routes, the eastern having passed along the Gulf of Bothnia, through the country of the Finns and Lapps, while the western branch had crossed from Russia to the Aland Islands, and spread from thence southward and westward; and it seems natural to infer that in their respective lines of migration they may have incorporated into their own speech some of the special characteristics that belonged to the language of the peoples with whom they came in contact. But the differences thus introduced could not have been important, for we find the same language employed in the several most ancient laws of the different people of Scandinavia, while the two Eddas (q. v.)—the oldest monuments of Scandinavian speech—which were compiled in Iceland, whither the Northmen had carried their language on their settlement in the island in the 9th c., give evidence of an almost complete identity of local and personal names. This unity of language is further proved by the agreement which is found to exist in all runic inscriptions, from Slesvig to the northern parts of Sweden, and from Zealand to the western shores of Iceland. All monuments of this old Northern tongue would, however, have been lost to us, had not the Norræna or Norwegian form of it been carefully preserved and cultivated in Iceland through the short songs (*hlvod* or *quida*) relating to the deeds of the gods and heroes of the north, which had existed as early probably as the 7th c., and had passed with the religion and usages of Norway to the new colony.

After the introduction of Christianity into Iceland in the year 1000, schools were founded there, classic literature was cultivated and Roman characters were adopted for the writing of the national tongue, but this did not interfere with the zeal with which the national laws and poems were collected and studied by native scholars. This literary activity continued unabated till the 13th c., when the republic of Iceland, after having long been distracted by the dissensions of the rival aristocratic families of the island, was conquered by Hakon VI., king of Norway. Since 1380, Iceland has formed part of the Danish dominions, and although since that period the colonists have partly succumbed to the cramping influences of the subordinate and dependent conditions in which they have been placed; the distance from the mother-country, and the tenacity with which the people cling to all memorials of their former history, have enabled them to preserve their language so unchanged, that the Icelander of the present day can read the sagas of a thousand years since, and still writes in the same phraseology that his forefathers used ages ago. But while the old Scandinavian tongue was thus preserved in the

far distant colony, it had undergone great changes in Norway; and when, by the union of Calmar in 1380, the latter country was united to Denmark, the Danish form of speech, that had in the meanwhile been changing under the modifying influences due to the introduction of Latin and to contact with other nations, supplanted the Norwegian language, which thenceforth being banished from the pulpit, the law courts, and from literature, split up into numerous dialects peculiar to special valleys and fijords, but unknown in the larger towns.

When we come to examine the Icelandic or ancient Scandinavian, which is closely allied to its sister Teutonic languages, and like them betrays its eastern origin, we find that it differs from the latter in several important points. It has this striking peculiarity, that the definite article, instead of coming before the noun, is appended as a termination to the end of the word. The adjective, moreover, which in its indefinite form is subject to inflections, for all genders and cases, undergoes, when in its definite form, fewer and slighter changes. Again, while in the German tongues the verb in the infinitive ends in a consonant, in the old Scandinavian it invariably terminates in a vowel. The old Scandinavian language has a passive form of the verb unknown to its Gothic sister tongues; and while in German the third person of the present tense differs from the second person, such is not the case in Old Northern. In the latter, the vowel sounds are greatly modified by a very perfect system of combinations, indicated by dots or accents; and in addition to the consonants of the Gothic languages, it has an aspirated *d* and *t*. It possesses, moreover, a flexibility and richness of construction, which admit of favorable comparison with those of the ancient classical languages, while in regard to the number and comprehensiveness of its words, and its consequent independence of foreign derivates, it presents a character of regularity and unity which is wanting to the other Germanic languages. Its mode of construction is simple in prose, and in the earlier forms of poetry, although in the later periods of the Skalds (q. v.) it degenerated into a state of artificial complexity. The chief feature of the metrical system employed in Old Northern poetry was alliteration (q. v.). The alliterative method was continued after the introduction of terminal rhyme, but the simplicity of the ancient lay gave way in the 10th c. to the most artificial complexity of versification in the metres invented by the skalds. Besides these skaldic measures, of which 106 are enumerated in the *Hattalykli*, or Key of Metres, drawn up in the 13th c. by the Icelander, Snorri Sturlesson (q. v.), the skalds were required to know the *Kenningar*, or poetic synonyms, of which there were an enormous number; some words, as Odin, island, &c., having upwards of 100. The main feature of the system was that nothing must be called by its right name: thus a ship was a beast of the sea, a serpent of the waters, a dragon of the ocean, &c.; a woman was a graceful tree, a fair pearl, &c.; a wife was her husband's *Rune* (q. v.), or his confidential and intimate friend, &c.

The fragments of Old Northern poetry that have come down to us in the *Eddas*, belong for the most part to the 8th c., or even perhaps to the 7th c.; and consist of short songs (*hljod* or *quida*), which are either mystic, didactic, mythic, or mytho-historic in their character. See EDDA. It is supposed that some of these compositions, and several of the poems which celebrate the adventures of the gods, giants, and elves, were composed prior to the immigration into Scandinavia of Odin and his followers; while, on the other hand, the local coloring of others sufficiently prove their northern origin. In addition to the subjects belonging to the Odinic mythology, we have in the mytho-historic lays, known as the songs of the famous Smith Völundr, or the *Völundarquida*, a cyclus of heroic poems similar to the Old German epic the *Nibelungenlied* (q. v.); but much more ancient in form than that in which the latter has reached us. In the 9th and 10th centuries the ancient epic and the simple songs of the older poets gave place to the artificial poetry of the skalds, which, from its earliest development, manifested a realistic tendency, and made the real adventures of living men the subject of their compositions. Many of these compositions, as the *Eiriksmál*, or the Death and Apotheosis of King Eric Bloodaxe, who died in 952; the *Hakonarmal*, or Fall of Hakon the Good; and several poems by the famous Icelandic skald Egill Skalagrimson, while they afford valuable materials for the early history of the north, are among the latest of the skaldic productions that preceded the more degenerate periods of the art. To the 11th and 12th centuries belong the poems known as *Grongaldr* and *Solar-ljod*, which were composed in imitation of the ancient compositions, and consist of moral and didactic maxims, the former conceived from an assumed heathen, and the latter from a Christian point of view. In the 13th c., the skaldic art thoroughly declined, and gave place, in Iceland, to a puerile literature, based upon Biblical stories and saints' legends. In Scandinavia Proper, a more modern form of national literature was in the meanwhile being gradually developed by means of oral transmission, whence arose the folk-lore and popular songs of Norway and Sweden, and the noble Danish ballads known as the *Kæmpe viser*, whose composition in the Old Northern or Icelandic tongue may probably be referred to the 14th century.

The earliest Icelandic prose belongs to the beginning of the 12th c., when Ari 'hinns Frode,' or the Wise, composed a history of his native island and its population in the *Islendinga-bok* and *Landnáma-bok*, the latter of which was continued by others. He was the first northern writer who attempted to assign fixed dates to events by reference to a definite chronology, and his work is remarkable as the earliest historical composition written in the old Danish or Norse, as it still remains in the living language of Iceland. These works, which have since perished, entered largely into the composition of the annals of the early kings of Norway, compiled a century later by Snorri Sturlesson under the title of the *Heimskringla*. Throughout the middle ages the literature of Iceland was enriched with numerous national and other sagas, the materials of which were drawn from skaldic songs, folk-lore, local traditions and family histories; and in its later stages of development included among its subjects the mythic cycle of Arthur and his knights, Merlin, Alexander, Charlemange, &c. The compilation of the laws of the island attracted the attention of the Icelanders at an early period; and in 1118 a complete code, known as the Gragas, which had been derived from the ancient Norse law, was submitted to the Allthing or popular assembly, and a few years later the canons of the church, or the *Kristinrettr*, were settled and reduced to writing. A collection of those enactments in the ancient and subsequent codes, which are still in force in Iceland, has been made by Stephenson and Sigurdsson (Copen. 1853), under the title of *Lagasafn handa Islandi;* while the ancient Norse laws, beginning with the *Gula-things-lög* and the *Hirdskra* of Hakon the Good, which date from the 10th c., have been ably and critically edited in Norway under the title of *Norges gamle Love* (Christ. 1846—1849).

The study of the Old Northern language and literature, which was successfully inaugurated by the native scholars of Iceland in the 17th c., was soon prosecuted with equally happy results in Denmark and Sweden, and within the last 20 years in Norway, where the subject forms a necessary introduction to the investigation of the language and history of the country. Copenhagen, has, however, in recent times, been the principal seat of these inquires, the successful prosecution of which has been materially facilitated by the large number of important Icelandic MSS. contained in its libraries, and by the foundation of the Arne-Magnussen collection in 1772; and the different societies especially designed to promote the study of Icelandic and of northern antiquarian monuments. Among the Icelandic and Danish scholars who have gained pre-eminent distinction in these departments of research, we may instance Arne-Magnussen, Torfæus, Olavsen, Finn, Magnussen, Worm, Resenius, Bartholin, Thorlacius, Müller, Rask, Rafn, Keyser, Munch, Unger, Lange, &c. In the study of the grammar and comparative structure of the language, which excited an interest as early as the 13th c., as is proved by the grammatical treatises and rules of prosody incorporated in the younger *Edda*, no one has evinced a higher order of scientific acumen and critical learning than Rask (q. v.), who in his erudite work *Om det gamle Nordiske Sprogs Oprindelse* (Kjopenh. 1818) threw a flood of new and important light on the subject; while the labors of Jakob Grimm, Munch, and others, have tended materially to exhibit the affinities between the Old Northern and the Teutonic languages, and to assign to it its right position among the kindred Indo-Germanic tongues.

SCANDINAVIAN MYTHOLOGY. Our knowledge of Scandinavian mythology is mainly derived from the collections of ancient Northern sagas known as the Eddas (q. v.), which constitute the Odinic Bible, as it were, of heathen Scandinavia. The value and interest attaching to these records of the ancient faith of the Northmen are enhanced by the fact that there are strong grounds for assuming that the closest affinity, if not identity, of character existed between their religious doctrines and practices and those of the Germanic nations generally. Hence, in the absence of anything beyond the incidental notices of the Pagan religion of Germany, which are contained in the classic writers, the Eddaic exposition of northern mythology is of the highest importance to the student of the history of every nation of Teutonic origin. Owing to the remote situation of the Scandinavian lands, and the hold which the Odin religion had taken on the minds of the Northmen—whose natural tendencies inclined more to the Pagan merits of valor, courageous endurance of hardships, indomitable resolution, and unflinching fidelity in hate and love, than to the Christian virtues of submission, meekness, and forgiveness of injuries—Christianity took root slowly and insecurely in those lands, and only long after a national literature, based upon the superstitions and memorials of the ancient faith had been firmly established among the people. But although there is every reason to believe that all branches of the great Indo-Germanic family of nations had essentially the same system of belief and worship,

and venerated the same deities, minor differences were numerous. Thus, for instance, while Danes, Saxons, and Gothlanders worshiped Odin as their chief god, the Swedes generally paid supreme honors to Frey, the god of the year; some tribes of Northern Germany regarded Hlodyn, or the Earth, as their principal deity; and the Norwegians directed their worship to Odin's son, Thor; while in some parts of Norway even, as in Halgoland, the people worshiped deities not honored elsewhere in Scandinavia. Thus the chief objects of worship in the latter district were Thorgerd, Horgabrud, and Irpa, the daughters of Halogi, or high flame, from whom the name of the country was derived, and who was probably identical with Loki (Fire), who, after having, according to the myth, been beneficent in the beginning of time and united with the All-father, fell from his high estate, and, like some fallen angel, became crafty, evil, and destructive as a desolating flame. Halgoland appears from remains discovered there to have been a special seat of fire or sun worship, which seems to have been nearly universal at one period of the world's history.

Leaving for the present the discussion of the sources from whence the northern mythology derived some of the numerous complex elements which entered into its composition, we proceed to give a short summary of its cosmogony:—In the beginning of time a world existed in the north called Niflheim, in the middle of which was a well, Hvergelmeer, from which sprang twelve rivers. In the south was another world, Muspelheim, a light, warm, radiant world, the boundary of which was guarded by Surt with a flaming sword. Cold and heat contended together. From Niflheim flowed venomous, cold streams called Elivaager, which, hardening into ice, formed one icy layer upon the other within the abyss of abysses that faced the north, and was known as the Ginnunga-gap. From the south streamed forth the sparkling heat of Muspelheim; and as heat met cold, the melting ice-drops became instinct with life, and produced, through the power of him who had sent forth heat, a human being, Ymir, the progenitor of the frost-giants, by whom he was called Œrgelmer, or Chaos. He was not a god, but evil, both he and all his race. As yet there was neither heaven nor earth, neither land nor sea, but only the abyss Ginnunga-gap. Ymir drew his nourishment from the four milky streams which flowed from the udders of the cow Aedhumla, a creature formed from the melting frost. From Ymir there came forth offspring while he slept—a man and woman growing from under his left arm, and sons from his feet; and thus was generated the race of the frost-giants, or Hrimthursar, among whom the All-father dwelt in the beginning of time before the heavens and the earth were created.

In the meanwhile, as the cow Aedhumla licked the frost-covered stones, there came forth the first day a man's hair, the second day a head, and the third day an entire man. This man, *Buri*, or the Producing, had a son *Bör* (the Produced), who married Beltsa, one of the giant race, by whom he had three sons, Odin, Vili, and Ve.

These three brothers, who were gods, slew Ymir, and carrying his body into the middle of Ginnunga-gap, formed from it the earth and the heaven. Of his blood they made all seas and waters, taking the gore that flowed from his body to form the impassable ocean which encircles the earth; of his bones they made the mountains, using the broken splinters and his teeth for the stones and pebbles; of his skull they formed the heavens, at each of the four corners of which stood a dwarf, viz., Austri at the east, Vestri at the west, Northri at the north, and Suthri at the south. Of his brains they formed the heavy clouds, of his hair plants and herbs of every kind, and of his eyebrows they made a wall of defence against the giants round Midgard, the central garden or dwelling-place for the sons of men. Then the three brothers took the glowing sparks that were thrown out of the world Muspelheim, and casting them over the face of heaven, raised up the sun, moon, stars, and fiery meteors, and appointed to each its place and allotted course; and thus arose days, months, and years.

Night was of the race of the giants, and in turn married three husbands, by one of whom she had a daughter, Earth, and by another a son Day, who was bright and beautiful like the gods, or Œsir, to whose race his father Delling belonged. To this mother and son who were akin to the opposite races of the frost-giants and the gods, Allfader committed chariots and horses, and placed them in heaven, where Night rides first through her twenty-four hours' course round the earth with her horse Hrimfaxi, from whose bit fall the rime-drops that each morning bedew the face of the earth. Close after her comes her fair son Day, with his horse Skinfaxi, from whose shining mane light beams over heaven and earth. All the maidens of giant race were not dark like Night, for to Mundilfori were born a son and daughter of such beauty that their father gave to them the names of Mani or Moon, and Sol or Sun. The gods, incensed at this presumption, took them up to heaven, and ordained that they should direct the course of the sun and moon, which had been made to give light to the world, and thenceforth Sol drove the chariot of the Sun, which was drawn by two horses, Arvakur (the Watchful) and Alsvith (the Rapid), under whose shoulders the gods in pity placed an ice-cool breeze.

A shield named Svalin (the Cooling) was also by their care attached to the front of the car, to save sea and land from being set on fire. Mani directs the course of the moon, and he, like his sister, is followed by a wolf that seems about to devour him; and in the end of time this animal, which is of giant race, will with his kindred swallow up the moon, darken the brightness of the sun, let loose the howling winds, and sate himself with the blood of all dying men.

When heaven and earth were thus formed, and all things arranged in their due order, the chief gods or Œsir, of whom there were twelve, met in the middle of their city Asgard, which lay on the plain of Ida. These gods were Odin, or All-father, who has twelve names in Asgard besides many others on earth; Thor, Baldur, Tyr, Bragi, Heimdal, Hod, Vidar and Vali his sons, and Niord, Frey, Ull, and Forsetti. Here they raised for themselves a court with a high seat for All-fader; a lofty hall for the goddesses; and a smithy, in which they worked in metal, stone, and wood, but chiefly in gold, of which precious substance all the implements which they used were made, and hence this period of their existence was known as the Golden Age.

This age of peaceful labor lasted till three beautiful, but evil maidens made their way from the giants' world, Jotunheim, to Asgard, when confusion and ill-will arose in the world. Then the gods, taking counsel, determined to create new beings to people the universe, and first they gave human bodies and understanding to the dwarfs, who had been generated like maggots within the dead body of Ymir, but who now took up their abodes in the bowels of the earth, in rocks and stones, and in trees and flowers. Then Odin, with two companions, Hænir and Lodur, went forth on an excursion to the earth, where finding two trees, Ask and Embla, created a man and a woman of them, Odin giving them spirit or the breath of life, Hænir sense and motion, and Lodur blood and a fair color, with sight, speech, and hearing; and from this pair, whose dwelling was in Midgard, the human race has sprung.

A bridge of three colors, Bifrost, known to men as the rainbow, connects Midgard with Asgard, and over this the gods ride daily on their horses to the sacred fountain of Urd, where they sit in judgment. This fountain lies at one of the three roots of the ash, Yggdrasil, whose branches spread over the whole world and tower about the heavens. Under one of these roots is the abode of Hel (q. v.), the goddess of the dead, under another, that of the frost-giants, while under the third is the dwelling of human beings. Below the tree lies the serpent Nidhogg, who is constantly gnawing the roots, and striving with his numerous brood of lesser serpents to undermine Yggdrasil, whose branches are as constantly refreshed by water from the well of Urd, which is poured over them by the Norns. These are three maidens known as Urd, Verdandi, and Skulld (or Past, Present, and Future), who dwell in a fair hall below the ash-tree, where they grave on a shield the destiny which they determine for the children of men.

Besides gods, frost-giants, dwarfs, and men, there were other beings, as the Vanir, who dwelt in the world Vanaheim, lying between the abodes of the gods and of men, and the Light Elves and Dark Elves, the former of whom were friendly to mankind, and of great beauty, while the latter were of evil demoniacal natures, and blacker than pitch.

Now, after the three giant maidens came to Asaborg, dissensions soon broke out among these different races, and Odin, by casting a spear among mankind, created war and discord in the world. Then his maidens, the Valkyriur (or choosers of the doomed), surrounded by lightnings, rode forth with bloody corselets and radiant spears, to choose on every battle-field those who should fall, and to lead them into Valhal, where the chosen heroes known as Einheriar, daily go forth to fight and slay one another, but returning at early morn sound and fresh, recruit themselves for the next night's combats by drinking beer with the gods and eating the flesh of the sacred hog. It is, however, only men of rank, as jarls (or earls), who enter Odin's hall after death, for the base-born, or thralls, belong to Odin's powerful son, Thor (q. v.), who rules over Thrudheim, and drives through the world in a chariot drawn by he-gots, bearing with him his magic hammer Miolnir, the iron gloves which he requires to grasp the haft, and his belt of power.

Among the gods there reigned good-will and happiness even after the rest of the world had been disturbed by war, until Loki, or the impersonation of evil, who in infancy had been Odin's foster-brother, was admitted into Asaborg as their equal. By his treachery Baldur (q. v.), the purest, most beautiful, and best loved of Odin's sons, was slain. The gods, indeed, had power to inflict temporary punishment on Loki, and to chain him under a hot sulphur spring, where he lay for ages, but at length a time will come when Loki's evil progeny will prevail over the gods and the world. This terrible age of destruction, the Ragnarök

or twilight of the gods, will be marked by a three years' winter of hard frost, cutting winds, and sunless air uncheered by summer or spring-tide, when there will be bloodshed throughout the world, brothers will slay one another, parents and children will be at war. The wolf Fenrir will break loose, the sea will burst its bounds as the serpent Jormundgard, encircling Midgard, writhes in fierce rage, and struggles to reach the land. The wolf Sköll will swallow up the sun, and when the world is plunged in almost total darkness, his brother Hati will devour the moon, while the stars will vanish from heaven. As Midgard's serpent and the wolf Fenrir go forth, scattering venom through air and water, the heavens will be rent asunder; the ship Naglfar, which is made of dead men's nails, will be floated on the waters; the Œsir will ride forth across the bridge Bifrost, which will break away behind them; and all the friends of Hel, led on by Loki, will offer battle to the gods on Vigrid's plain. Then Odin, having taken counsel at Mimir's well, will advance armed with his spear Gungnir against the wolf Fenrir, while Thor encounters Midgard's serpent, and is killed by the venom which it exhales from its mouth. Although Fenrir, the wolf, will swallow Odin, and thus cause his death, he will himself be slain by the god Vidar, while Loki will fall beneath the hand of Heimdal, the watchman of the gods, and Surt, hurling fire from his hand, will burn up the whole world. After the conflagration of heaven and earth and the whole universe, there will still be dwellings for the evil and the good, the worst of which is Nastrond, a horrible habitation for perjurers and murderers, where serpent heads pouring forth venom line the walls, while in Gimli, Odin's best heaven, the good and virtuous will find a happy resting-place.

But from the great destruction of the universe another earth, verdant and fresh, will arise from the deep waters of the ocean, the unsown fields will bear fruits, and all evil will cease; Baldur and other gods will then return to Ida's plain, where Asgard once stood, and taking counsel together, will find the golden tablets which their race had possessed at the beginning of time, and remembering their deeds of old, will await the coming of the mighty All-father, the ruler of all things, who will pronounce judgments, and establish peace that shall endure to the end of time.

The above brief epitome of the Odin cosmogony serves as a framework for the numerous beautiful prose and poetic myths which make up the substance of northern mythology; and are contained in a rich mass of sagas, not all complete in themselves, but each capable of throwing some light on the others.

Many theories have been advanced to explain the origin and the fundamental ideas on which the northern myths have been based; and while some expositors have seen in them a mere re-clothing of Bible narratives, and a perversion of Christian truths, and have referred their composition to monks living in the middle ages, others, feeling that their title to antiquity could not be set aside, have gone to the other extreme, and tried to prove that they reflected the truths of Christianity, and represented under active and tangible forms the mysteries of Revelation; and that thus, for instance, in the narrative of Thor crushing the serpent we have a figurative delineation of Christ. Other interpreters, again, have attached very different meanings to these myths, regarding them as historic, psychical, physical, or even chemical; but against each of these assumed modes of explanation, taken in their full integrity, conclusive arguments might be adduced; and all that can be safely accepted is, that they are partly historical and partly an impersonation of the active forces of nature.

Like the northern languages, their original seat was in the south and east, where kindred mythologies existed among the ancient tribes of India and Persia; and it is probable that the more practical and energetic spirit of the northern myths, and the more warlike character of the gods of the north, when compared with the reflective and contemplative nature of their oriental prototypes, may be due to the gradual effect on the minds of a people who had passed from the soft enervating influences of a southern climate to the stern rigors of the north, where man lived in constant warfare with the elements and with his fellowmen. According to Snorri Sturlesson (q. v.), whose opinion seems to a certain extent to have been a mere re-echo of the traditional belief of his forefathers, Odin and his sons and companions were earthly kings and priests of a sacerdotal caste, who had migrated from Asia—perhaps, as some conjectured, from Troy—and who conquered and ruled over various parts of Scandinavia and Northern Germany, where after their death they were regarded by the people as deities. In conjunction with this mode of representation, the mythic tales of the warfare of the gods with giants, their intercourse with dwarfs, and spirits of the air and water, and their wanderings on earth, are interpreted as memorials of real war with pre-existing races, and of the spread of Odin's religion from its chief seat in Sweden over the neighboring countries. This theory explains only a few of the myths; while some, as we have already observed, may be referred to traces of an older faith, which lingered amongst the Finns and Lapps after the advance of the more civilized conquering races had driven those tribes from the southern districts of Scandinavia, which they originally occupied, to the barren recesses of the north.

The worship of the gods was celebrated either in spacious temples, of which there were many in different parts of Scandinavia, or on stone-heaps or altars, known as *horg*. These altars were always near some well, and close to a sacred grove, or a solitary tree, on which the votive offerings were suspended, after they had been washed at the neighboring spring by the attendant priestesses, known as *horgabrudar*. Human sacrifices, although never resorted to on ordinary occasions, were not uncommon in times of public calamity, arising from war, failure of crops, disease, &c.; and the horse, whose flesh was highly esteemed, was a frequent victim, while the fruits of the earth and spoils of war were the usual offerings. Three great festivals were held every year, the first of which was celebrated at the new year in the Yule month, when Thorablot, or the sacrifice of Thorri, an ancient god of the Finns and Lapps, was offered. On these occasions, offerings were made to Odin for success in war, and to Frey for a fruitful year, the chief victim being a hog, which was sacred to the latter god, on the assumption that swine first taught mankind to plough the earth. Feastings and Yule games occupied the whole of the month, whence it was also called the Merry Month. The second festival was in mid-winter, and the third in spring, when Odin was chiefly invoked for prosperity and victory on the Vikings, or sea-roving expeditions which were then entered upon. On the introduction of Christianity, the people were the more ready to conform to the great church festivals of Christmas and Easter, from the fact of their corresponding with the ancient national sacrificial feasts; and so deep-rooted was the adhesion to the faith of Odin in the north, that the early Christian teachers, unable to eradicate the old ideas, were driven to the expedient of trying to give them a coloring of Christianity. Thus the black elves, giants, evil subterranean sprites, and dwarfs, with which the Northmen peopled earth, air, and water, were declared by them to be fallen angels or devils, and under the latter character suffered to retain their old denominations. Belief in these imaginary beings survived the spread of the Reformation, and can scarcely be said to have died out in Scandinavian lands among the superstitious and ignorant, while among the more enlightened the myths connected with them are still related, and serve to give a poetic interest to special localities.

Our own association with the Scandinavian mythology is perpetuated in numerous superstitions and usages still lingering amongst us, and in the names of the days of the week. See WEEK.

The best northern authorities on Scandinavian mythology are N. M. Petersen, *Nordisk Mythologi* (2d ed. 1865); the Norwegian works of Munch and Keyser; Jacob Grimm, *Deutsche Mythologie;* Simrock's *Handbuch* (4th ed. 1874); Mannhardt, *Die Götterwelt;* Thorpe, *Northern Mythology*.

SCANSO'RÉS. See CLIMBERS.

SCA'NTLING, the sectional breadth and thickness of timbers for roofs, floors, &c. The term is also applied to quarterings or pieces of timber of about five inches in thickness and under.

SCA'PHOID BONE (Gr. *skaphe*, a boat), a term applied to two somewhat boat-like bones, of which one occurs in the carpus or wrist (see HAND), and the other in the tarsus of the Foot (q. v.)

SCAPPLE, a kind of work applied to masonry. To scapple a stone, is to work the surface even without making it smooth.

SCA'PULA, THE, or SHOULDER BLADE, is a flat triangular bone, which, when the arm hangs loosely down, extends posteriorly and laterally from the first to about the seventh rib. It presents for examination an outer convex and an inner, smooth, and concave surface, three borders (a superior, an inferior or axillary, and a posterior), three angles, and certain outstanding processes.

The figure represents an outer or posterior view of the scapula. It is divided into two unequal parts, the supra-spinous fossa (1), and the infra-spinous fossa (2), by the spine (10), a crest of bone commencing at a smooth triangular surface (11) on the posterior border, and running across towards the upper part of the neck of the scapula (8), after which it alters its direction, and projects forwards so as to form a lofty arch, known as the acromion process (12), which overhangs the glenoid cavity (6), or receptacle for the head of the humerus, or main bone of the arm. This acromion (so called from the Greek words *acros omos*, the summit of the shoulder) obviously serves to protect the shoulder joint, as well as to give great leverage to the deltoid muscle which raises the arm. It is this process which gives to the shoulder its natural roundness. From the upper part of the neck (8) there proceeds a remarkable curved projection termed the coracoid process, from its supposed resemblance to the beak of a raven (Gr. *korax*). It is about two inches long, and gives attachments to several muscles.

The upper border of the scapula presents a very remarkable notch (4), which in the recent state is bridged over with a ligament, and gives passage to the supra-scapular nerve. This bone articulates with the clavicle and humerus, and gives attachment

A Posterior View of the Left Scapula:

The parts designated by the figures 1, 2, 4, 6, 8, 10, 11, 12, are sufficiently described in the text; 3 is the superior border; 5, the anterior or axillary border; 7, the inferior angle; 9, the posterior border or base; 13, one of the nutritious foramina; 14, the coracoid process. (From Wilson's *Anatomist's Vade Mecum*).

to no less than 16 muscles, many of which, as the biceps, triceps, deltoid, serratus magnus, are very powerful and important.

The uses of this bone may be stated as follows: 1. It connects the upper extremity to the trunk, and participates in, and is subservient to many of the movements enjoyed by the arm; 2. By its extended flat surface it furnishes a lateral protection to the chest; and 3. It affords attachments to various muscles which modify the size of the thoracic cavity, and is thus concerned in the process of respiration.

SCA'PULAR, or SCAPULARY (Lat *scapula*, the shoulder), a portion of the monastic habit, so called from its being worn upon the shoulders. It consists of a long stripe of serge or stuff, the center of which passes over the head, one flap hanging down in front, the other upon the back. The scapular of the professed monks in most orders reaches to the feet, that of the lay brothers only to the knees. The color differs for different religious orders or congregations. Besides the scapular worn by the members of religious orders strictly so called, there exists also in the Roman Catholic Church a religious association or confraternity, the members of which, while living in the world and mixing in ordinary life, wear, although not conspicuously, a small religious emblem called a scapular. The chief duties of this confraternity consist in the recitation of certain prayers, or the observance of certain religious or ascetical exercises through devotion to the Blessed Virgin. The members may or may not bind themselves by a vow of chastity. This pious association was founded in the middle of the 13th c. by an English Carmelite friar named Simon Stock, and is said to have originated in a vision, which has been the subject of much controversy, as well with Protestants as among Catholics themselves.

SCARABÆ'IDÆ, a very numerous tribe of lamellicorn coleopterous insects (see LAMELLICORNES), of which more than 3000 species are known, the greater number inhabitants of tropical countries, although species are found in almost all parts of the world. Some of the tropical species are amongst the largest of beetles; those found in colder regions, as in Britain, are of comparatively small size. The tribe is divided into six sections: *Coprophagi* (dung-eaters), *Arenicoli* (dwellers in sand), *Xylophili* (delighting in wood), *Phyllophagi* (leaf-eaters), *Anthobii* (living on flowers), and *Melitophili* (delighting in honey), named according to prevalent and characteristic habits of the species belonging to them, although the names do not accurately denote the habits of all the species of each section. The sections are distinguished by differences in the organs of the mouth and the antennæ. To the section *Crotophagi* belong the greater number of the Dung Beetles (q. v.), or Scavenger Beetles, so useful in warm countries in removing offensive matter; amongst which is the Sacred *Scarabæus* of the ancient Egyptians (*Scarabæus*, or *Ateuchus sacer*). Some of the *Xylophili*, as the great Hercules Beetle (q. v.), have remarkable projections from the head or the thorax of the males. The Cockchafer (q. v.) is an example of the *Phyllophagi;* the Goliath Beetle (q. v.) is one of the *Melitophili*, to which section the Rose Beetle, common in Britain, also belongs. None of the *Anthobii* are British.

SCARABÆ'US, the name of a beetle held sacred by the Egyptians, commonly known in entomology as the *Scarabæus* or *Ateuchus sacer*. It was called *Heliocantharus* or *Cantharus*, by the Greeks, and S. by the Latins. Scarabæi were employed for rings, necklaces, and other purposes by the Egyptians, Phœnicians, and Etruscans (see GEMS). These are principally distinguished by the absence or presence of striated elytra and other marks. Entomologists have recognized four distinct species of the *Ateuchus* on the Egyptian monuments, viz., *A. semipunctatus*, *A. laticollis*, *A. morbillosus*, *A. puncticollis*. Several mystical ideas were attributed to the S.: the number of its toes, 30, symbolized the days of the month; the time it deposited its ball in which its eggs were deposited, was supposed to refer to the lunar month; the movement of the clay-ball referred to the action of the sun on the earth, and personified that luminary. The S. was supposed to be only of the male sex, hence it signified the self-existent, self-begotten, generation or metamorphosis, and the male or paternal principle of nature. In this sense it appears on the head of the pygmæan deity, Ptah-Socharis Osiris, the demiurgos, and in astronomical scenes and sepulchral formulas. In the hieroglyphs it is used for the syllable *khepru*, and expresses the verb 'to be, exist.' In connection with Egyptian notions, the Gnostics and some of the Fathers called Christ the scarabæus. The insect, during its life, was worshiped, and after death, embalmed.—*Horapollo*, i. c. 10; Ælian, *De Nat. Anim.* x. 15; Pettigrew, *History of Mummies*, p. 221; Wilkinson, *Man. and Cust.* v. p. 255.

Scarabæus.

SCA'RAMOUCH (Ital. *scaramuccia*, skirmish), a character in the old Italian comedy, originally derived from Spain, representing a military poltroon and braggadocio. He was dressed in a sort of Hispano-Neapolitan costume, including a black *toque* and mantle, and a mask open on the forehead, cheeks, and chin, and always received an inglorious drubbing at the hands of harlequin.

SCA'RBOROUGH (i. e., fortified rock), a seaport and municipal and parliamentary borough in Yorkshire, in the North Riding, 42 miles north-east of York, and about 20 miles north-west of Flamborough Head. It is built around a charming bay open to the south and south-west, and protected on the north-east by a promontory ending in a castle-crowned height, which looks out on the North Sea. From the sands the town has gradually climbed the rising ground behind in successive terraces and crescents. The chief buildings are churches, chapels, and benevolent and other institutions, with which the town is well furnished. A fine cast-iron bridge, 75 feet high, and stretching over a chasm 400 feet wide, connects the old and new towns, and leads to the spa, and a bridge was erected in 1865 over a picturesque ravine to connect the western part of the town with its large and fashionable southern suburb. The springs, which are saline and chalybeate, are on the margin of the sea, and are surrounded by walks and ornamental grounds. The harbor, composed of three piers, and furnished with a lighthouse, is the most important in this part of the east coast. Every accommodation is offered to visitors for sea-bathing; S. is reputed a most fashionable watering-place, and has about 200,000 visitors annually. The season lasts from June to the middle of October. In 1880, 382 vessels, of 25,711 tons, entered, and 351 of 23,302 tons, cleared the port. Pop. (1881) 30,484. The castle was erected about the year 1136. It was held against the barons by Piers Gaveston, who, however, surrendered, and it was twice besieged by the parliamentary forces. At present it is a barrack, and is fortified by batteries. New Spa buildings were opened in 1880.

SCA'RCEMENT, a plain set-off or projection in a wall; foundations have generally one or more scarcements.

SCARF, in Heraldry, a small ecclesiastical banner suspended from the top of a crozier.

SCARFING, the junction of two pieces of timber made to overlap, and united so as to appear as one piece.

SCARLATI'NA, or SCARLET FEVER, is one of the group of diseases called Exanthemata (q. v.). In addition to the characters common to the group, scarlatina is almost always attended by sore throat, and the rash or eruption, which is of bright scarlet color, commonly appears as early as the second day after the manifestation of the febrile symptoms, and ends in desquamation of the cuticle on the sixth or seventh day. Most writers on medicine make three varieties of this disease—viz., *S. simplex*, in which there are the fever and the rash, but scarcely any throat-affection; *S. anginosa*, in which, in addition to the fever and the rash, the throat-affection is the most prominent symptom; and *S. maligna*, a name which is applied to certain cases of extreme violence, in which the system is at once overwhelmed by the force of the disease, or in which the symptoms evince an extraordinary degree of weakness and want of vital power.

The disease begins with shivering, lassitude, headache, a fre-

quent pulse, a hot dry skin, a flushed face, thirst, loss of appetite, and a furred tongue. Shortly after the appearance of the febrile symptoms, the throat begins to feel irritable, and, on examination, is found to be red, and often more or less swollen. This redness becomes diffused over the interior of the mouth, and the tongue. The rash begins in the form of minute red points, which soon become so numerous that the surface appears of an almost uniform red. It first appears on the neck, face, and breast, whence it gradually spreads over the trunk and extremities. The reddened surface is smooth to the touch, and the color temporarily disappears on pressure of the finger. Along with the true rash, minute vesicles, known as *Sudamina* (q. v.), sometimes occur. The eruption, in ordinary cases, is persistent for three or four days, after which it gradually disappears, and is usually gone by the end of the seventh day. The cuticle then begins to scale off in small bran-like scurf, or in flakes of various sizes.

Specimens of an almost entire epidermic covering of the hand or foot, forming a natural glove or slipper, are of common occurrence in our pathological museums; but it is comparatively seldom that such perfect moulting takes place. The desquamative process is usually completed in a fortnight, or rather more, from the commencement of the disease. The fever does not abate on the appearance of the rash, but continues in a more or less decided degree through the progress of the case; it often presents exacerbations towards the evening, and is occasionally attended with delirium, or even with comatose symptoms. If the urine be examined, both chemically and microscopically, a few days after desquamation has set in, it will be found to contain albumen, and to exhibit a large amount of epithelium from the uriniferous ducts of the Kidneys (q. v.).

Malignant Scarlatina is so terrible a disease that its characteristic symptoms require a brief special notice. The rash comes out late and imperfectly, and sometimes is hardly perceptible; or, having appeared, it may suddenly recede; and sometimes it is intermixed with livid spots. The pulse is feeble, the skin is cold, and there is extreme prostration of strength. In such a case as this, death may occur (apparently from blood-poisoning) in a few hours. Other cases rapidly assume a typhus-like character. 'The pulse (says Dr. Watson) becomes frequent and feeble; the tongue dry, brown, and tremulous; the debility extreme; the breath offensive; the throat is livid, swollen, ulcerated, and gangrenous; and the respiration is impeded by viscid mucus, which collects about the fauces. Over this variety of the disease, medicine has comparatively little control.'

Even in *S. anginosa*, there is very considerable danger. The disease may prove fatal (1) from inflammation or effusion within the head, or (2) from the throat-affection, which too often proceeds to disorganization and sloughing of the adjacent parts. Moreover, in parturient women, even the mildest form of the disease is fraught with the greatest peril. Further, when the disease is apparently cured, the patient is exposed to great hazard from its consequences or *sequelæ*. Children who have suffered a severe attack of scarlet fever are liable (in the words of the eminent physician to whom we have already referred) 'to fall into a state of permanent bad health, and to become a prey to some of the many chronic forms of scrofula—boils, strumous ulcers, diseases of the scalp, sores behind the ear, scrofulous swellings of the cervical glands and of the upper lip, chronic inflammation of the eyes and eyelids. The above-named consequences not unfrequently follow small-pox and measles, but in addition to these, scarlatina is often followed by the form of dropsy known as *anasarca*, or serous infiltration of the subcutaneous cellular tissue, frequently accompanied with dropsy of the larger serous cavities. Strange as it may at first sight appear, this dropsy is much more common after a mild than after a severe form of the disease; but this apparent anomaly is probably due to the fact, that less caution is observed in the former than in the latter cases during the dangerous period of desquamation. If the patient (for example) is allowed to go out while new cuticle is still forming, the perspiratory power of the skin is checked by the cold, and the escape of the fever poison through the great cutaneous outlet is thus prevented. An excess of the poison is therefore driven to the kidneys, where it gives rise to the form of renal diease known as 'acute desquamative nephritis.'

Scarlatina is a disease that—like all the exanthemata—occurs in the epidemic form; and each epidemic presents its peculiar type, the disease being sometimes uniformly mild, and in others almost as uniformly severe. The treatment of this disease varies according to the preponderating symptoms. In *S. simplex*, nothing is required except confinement to the house, a non-stimulating diet, and the due regulation of the bowels, which are apt to be costive. In *S. anginosa*, cold or tepid sponging gives much relief if the skin is hot. If there is much fever, and especially if delirium supervene, a few leeches should be applied behind the ears, or if the patient were previously in robust health, blood might be cautiously taken from the arm. If, however, no bad head-symptoms are present, all that is necessary is to prescribe saline draughts, of which citrate of ammonia, with a slight excess of carbonate of ammonia, forms the best ingredient, and to keep the bowels open once or twice a day by gentle laxatives. In *S. maligna*, there are two main sources of danger, which were first recognized as distinct by Dr. Watson, who describes them as follows: 'The one arises from the primary impression of the contagious poison upon the body, and particularly upon the nervous system, which is overwhelmed by its influence. The patients sink often at a very early period, with but little affection either of the throat or skin. If we can save such patients at all, it must be by the liberal administration of wine and bark, to sustain the flagging powers until the deadly agency of the poison has in some measure passed away. But another source of danger arises from the gangrenous ulceration which is apt to ensue in the fauces, when the patient is not killed by the first violence of the contagion. The system is *re*-inoculated, I believe, with the poisonous matter from the throat. Now, under these circumstances also, quinia, or wine, and upon the whole, I should give the preference to wine, is to be diligently though watchfully given.' In addition to these remedies, a weak solution of chloride of soda, of nitrate of silver, or of Condy's disinfectant fluid, should be used as a gargle; or if, as is too often the case, the patient is incapable of gargling, the solution may be injected into the nostrils and against the fauces by means of a syringe or elastic bottle.

Three medicines have been so highly commended in scarlet fever generally, by trustworthy observers, that it is expedient to notice them. The first is chlorate of potash (KO,ClO_5) dissolved in water in the proportion of a drachm to a pint. A pint, or a pint and a half, may be taken daily. It was originally prescribed under the idea that it gave off its oxygen to the blood, and was eliminated from the system as chloride of potassium (KCl). Although this view is now known to be incorrect, there is no doubt that the salt is often prescribed with great benefit in this and some other diseases, as, for example, diphtheria and typhus fever. The second medicine is a very weak, watery solution of chlorine, of which a pint may be taken in the day; and the third is carbonate of ammonia in five-grain doses three times a day, given in beef-tea, wine, &c.

In the early stage, before the appearance of the rash, scarlatina may be readily mistaken for several other febrile diseases, after the appearance of the rash, the only disease for which it can be mistaken is measles, and we must refer to the article on that disease for a notice of the distinctive characters of the two affections.

There is no complaint in which the final result is more uncertain than this, and the physician should give a very guarded opinion as to how any special case may terminate.

Whether the disease is contagious throughout its course, or only at one particular period, is unknown; and if the physician is asked at what period the danger of imparting the disease on the one hand, or catching it on the other, is over, he should candidly declare that he does not know. That the contagion remains attached to furniture, clothing, &c., for a long period is undoubted. Dr. Watson gives a remarkable instance of a small piece of infected flannel communicating the disease after the interval of a year.

The popular delusion that *scarlatina* is a mild and diminutive form of *scarlet fever* should always be corrected, as the error, if uncorrected, may do much harm by leading to a disregard of those precautions which are always necessary in this disease.

SCARLATTI, ALESSANDRO, a musician of great eminence, born at Trapani in Sicily in 1659. He is said to have studied under Carissimi; if so, it must have been when very young. In 1680, S. visited Rome, and composed his first opera, *L'onestà nell' amore*, first performed at the court of Queen Christina of Sweden. His opera, *Pompeo*, was performed at Naples in 1684. In 1693, he composed the oratorio, *I Dolori di Maria sempre Vergine*, and the opera *Teodora*, in which orchestral accompaniments were first introduced to the recitatives, and a separate design given to the accompaniments to the airs. In the following eight years, during part of which time he held the office of *maestro di capella* at Naples, he produced various operas, the most remarkable being *Laodicea e Berenice*, composed in 1701. Between 1703—1709 he held the situation of *maestro di capella* at St. Maria Maggiore at Rome; he then returned to Naples; and in 1715, produced *Il Tigrane*. Alessandro S. died in 1721. His musical works comprise 117 operas, several oratorios and a great deal of church music, besides various madrigals and other chamber music. He was the founder of the Neapolitan school, in which were trained most of the great musicians of last century, and whose influence can be traced in the works of almost every composer who has flourished since. His invention was rich and bold, his learning great, and his style pure. His modulations, often unexpected, are never harsh, and never difficult for the voice.—His son, DOMENICO (born 1685, died 1757), was the first harpsichord player of his day. Among his compositions are a number of sonatas, remarkable for

invention, graceful melody, and skilful construction.—Domenico S. had a son, GIUSEPPE (born 1718, died 1796), who was also known as an eminent musician.

SCARLET COLORS. Cochineal furnishes the only scarlet color generally employed in dyeing, and for this purpose it is very extensively used; a solution of tin and cream of tartar is employed as the mordant to fix it. Scheffer, who produced the best formula for dyeing this color, also added starch, the proportions being as follow: Starch, 9 lbs.; cream of tartar, 9 lbs. 6 oz.; solution of tin, 9 lbs. 6 oz.; and cochineal, 12 lbs. 4 oz. These are the quantities required for 100 lbs. of wool or cloth.

SCARLET RUNNER. See KIDNEY BEAN.

SCARP. See ESCARP.

SCARPA, ANTONIO, a celebrated anatomist, was born on 13th June 1747, at Castello-Motta, a village in the Friuli. He was educated at Padua, where his ardor attracted the attention of the octogenarian Morgagni, who, having lost his sight shortly after the arrival of S. at the university, engaged the young enthusiast as his secretary, and dictated to him in Latin the answers which he made to letters soliciting his advice. The intervals between their medical studies were employed by Morgagni and S. in the perusal of the Latin authors, and it is to this practice that we must ascribe the elegance that distinguished the scientific style of S. in his subsequent publications. In 1772, he was appointed Professor of Anatomy in Modena. He afterwards visited France, Holland, and England; and while in London, was so enamored of John Hunter's Museum, that he did not rest until he had constructed a similar one at home. In 1783, he filled the anatomical chair at Pavia. He made, in the following year, a journey throughout the greater part of Germany, and in the course of it acquired the experience that made him one of the greatest clinical surgeons in Europe. On his return to Pavia, he published in rapid succession treatises on the anatomy of the Organs of Smell and Hearing; on the Nerves of the Heart, and on the minute anatomy of Bone. These, especially that on the innervation of the heart, which settled the question whether that viscus was supplied with nerves, gave S. a European reputation.

His work on the Diseases of the Eye, published in 1801, was followed in 1804 by his observations on the cure of Aneurism. But his greatest achievement was his work on Hernia, published in 1809. His reputation was now at its highest; but three years afterwards, he had to give up the work of public teaching, and entered, in 1814, on the office of Director of the Medical Faculty of Pavia. His next publication was some valuable observations on the operation for Stone. For the last years of his life, he suffered from almost total blindness, until, on the 30th of October 1832, he died at Pavia, of inflammation of the bladder. S.'s merits as an observer, a teacher, and a writer were very great. Industrious, scholarly, artistic, he appeared to great advantage in nearly every subject he undertook.

SCARPA'NTO (anc. *Carpathos*), an island in the Mediterranean, belonging to Turkey, midway between the islands of Rhodes and Crete. It is 32 miles long, and about 8 miles in extreme breadth, and its surface is covered with bare mountains, which reach the height of 4000 feet. The ruins of towns, which are found in several places, seem to indicate that formerly the island was well peopled. At present, the inhabitants are only about 5000 in number, and are mostly employed as carpenters and workers in wood, a trade of which they seem peculiarly fond, and in commerce.

SCARPE, in Heraldry, a diminutive of the bend sinister, being half the breadth of that ordinary.

SCARRON, PAUL, the creator of French burlesque, was born at Paris in 1610. His father, a counsellor of parliament, was a man of fortune and good family; but he having married again after the death of Paul's mother, discord broke out between the second wife and her step-children, the result of which was that Paul had to leave the house. About 1634, he visited Italy, where he made the acquaintance of Poussin the painter. On his return to Paris, he delivered himself over to a life of very gross pleasure, the consequence of which was that, in less than four years, he was seized with permanent paralysis of the limbs. What makes this incident in his career still interesting is the fact, that it undoubtedly exercised no inconsiderable influence on the development of his peculiar genius, which, as a French critic justly says, was 'the image of his body.' His love of burlesque, of malicious buffoonery, of profane gaiety, was simply a way of escape through the gates of mockery from the *tourmens vehemens* of his incurable ailment. His scramble for the means of living is excusable when we consider his hapless infirmity. He wrote verses, flattering dedications, begging-letters for pensions, &c.; and in 1643 he even managed to get a benefice at Mans, which he held for three years, when he returned to Paris, and lived in a sort of elegant Bohemian style. He had a pension from Mazarin of 500 crowns; but when the cardinal declined (probably from avarice) to allow the *Typhon* to be dedicated to him, S. got absurdly indignant, and joining the Frondeurs, lampooned Mazarin with spleenful virulence. However, when the war of the Fronde was at an end, and Mazarin had triumphed, S. was ready with an ode to

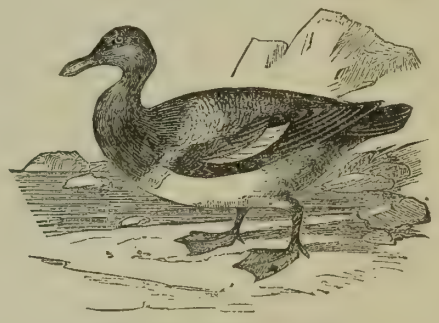
Jule, autrefois l'objet de l'injuste satire.

This baseness, however, did not win him back his pension, which the 'object of his unjust satire' had withdrawn; and it might have fared hard with the poet, had other friends not started up—for example, Fouquet, who granted him a pension of 1600 crowns—and had he himself not been the most consummate beggar that ever lived.

If he could not get a benefice or a purse of gold, or a lodge at court, he would take a load of firewood, or a carriage, pasties, capon, cheese, poodles, &c.—nothing came amiss; and his ample acknowledgments showed how thoroughly he had mastered the art of expressing gratitude. Doubtless his physical helplessness induced this bad habit, but his importunities were so pleasantly worded that they never estranged the friends on whom he fastened. In 1652, S. married Françoise d'Aubigné—a girl of 17, who subsequently became the mistress of Louis XIV., and is known as Madame Maintenon (q. v.). He died early in October 1660—the exact date is not known, but he was buried on the 7th. It is a proof of the charm of his company that his rooms were frequented by most of the men and women of his day who were distinguished either in literature or society. Among his works may be mentioned *Le Typhon*, *Virgile Travesti* (Par. 1648—1652), *La Mazarinade* (1649), *La Baronade Léandre et Héro*, *Ode Burlesque*, *La Relation du Combat des Purques et des Poëtes sur la Mort de Voiture*, *Poésies Diverses* (Par. 1643—1651), comprising sonnets, madrigals, epistles, satires, songs, &c.; *Le Roman Comique* (Par. 1651), a most amusing account of the life led by a company of strolling players—it is the best known, and perhaps the best of all S.'s productions; *Nouvelles Tragi-comiques*, from one of which (*Les Hypocrites*) Molière has taken the idea of Tartufe; besides a number of clever but coarse comedies. The editions of his works are very numerous, but the best is that of Bruzen de la Martinière (Amster., 10 vols., 1737; Par., 7 vols., 1786). Victor Fournel, to whom we are indebted for most of the information in this article, republished *Le Roman Comique*, in 1857, and *Le Virgile Travesti* in 1858.

SCA'TTERY ISLAND, a small islet in the estuary of the Shannon, three miles south-west of the town of Kilrush. Besides a fort, the islet contains fragments of several small churches, and an ancient round tower 120 feet high.

SCAUP DUCK (*Fuligula*—or *Nyroca*—*marila*), an oceanic species of duck, of the same genus with the Pochard (q. v.) an inhabitant of the northern parts of the world, spending the summer



Scaup Duck (*Fuligula marila*).

in arctic or subarctic regions, and visiting the coasts of Britain and of continental Europe as far south as the Mediterranean in winter, when it is also to be seen in great flocks in the United States, not only on the sea-coast, but on the Ohio, Mississippi, and other rivers. It breeds in fresh-water swamps. It is nearly equal in size to the Pochard. The male has the head, neck, and upper part of the breast and back black, the cheeks and sides of the neck glossed with rich green; the back white, spotted, and striped with black lines; the wing-coverts darker than the back, the speculum white; the rump and tail-coverts black. The female has brown instead of black, and old females have a broad white band around the base of the bill. The flesh of the S. D. is tough, and has a strong fishy flavor.

SCEATTÆ. See NUMISMATICS.

SCENA. See THEATER.

SCEPTICISM (Gr. *skeptomai*, 'I consider') strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering over subjects of thought. Scepticism is therefore the opposite of dogmatism (see DOGMA). The notion of 'disbelief,' is quite a secondary meaning of the term. Among

the Greeks, a *skeptikos*, 'sceptic,' was originally only a thoughtful person, and the verb *skeptomai*, never acquired any other signification than 'to consider.' But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision or cooler head, are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled by the violent shock given to their reason to 'doubt,' it may be to 'disbelieve' what they hear affirmed by the multitude with indefensible emphasis of speech. Thus it is that in common parlance a sceptic has come to mean an infidel, and scepticism infidelity. But the field of thought in which scepticism properly so-called has preferred to exercise itself is not religion but philosophy. Philosophical sceptics in all ages and countries have generally denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. In ancient times, Pyrrhon (q. v.), in modern, David Hume (q. v.), are the most characteristic representatives of this kind of scepticism.

SCEPTRE (Gr. *skeptron*, staff; from *skepto*, to send or thrust), originally a staff or walking-stick, hence in course of time, also a weapon of assault and of defence. At a very early period the privilege of carrying it came to be connected with the idea of authority and station. Both in the Old Testament and in Homer, the most solemn oaths are sworn by the sceptre, and Homer, speaks of the sceptre as an attribute of kings, princes, and leaders of tribes. According to Homer, the sceptre descended from father to son, and might be committed to any one to denote the transfer of authority. Among the Persians, whole classes of persons vested with authority, including eunuchs, were distinguished as the 'sceptre-bearing classes.' The sceptre was in very early times a truncheon pierced with gold or silver studs. Ovid speaks of it as enriched with gems, and made of precious metals or ivory. The sceptre of the kings of Rome, which was afterwards borne by the consuls, was of ivory, and surmounted by an eagle. While no other ensign of sovereignty is of the same antiquity as the sceptre, it has kept its place as a symbol of royal authority through the middle ages and down to the present time. There has been considerable variety in its form; the sceptre of the kings of France of the first race was a gold rod as tall as the king himself.

SCHADOW, Godenhaus Friedr. Wilh. von, a distinguished German painter, of the Düsseldorf school, was born at Berlin, September 6, 1789. His father, Joh. Gottf. S., an eminent sculptor, died director of the Berlin Academy of Arts, in 1850. At first young S. did not give much promise of excellence, but during his first visit to Rome, the influence of Overbeck, Cornelius, Führich, Veit, &c., awoke his dormant genius, and both singly and in company with some of these artists, he executed several pictures remarkable for their depth of religious sentiment; as 'An Explanation of the Dream of Joseph' and 'The Grief of Jacob when told of the Death of his Son.' While residing in the city of the pope, he passed over to Roman Catholicism. Scarcely had S. returned to Berlin when he was appointed professor of the academy, and soon gathered round him a host of brilliant pupils; but in 1826 he went to Düsseldorf as successor of Cornelius in the direction of the notable academy there. His pupils followed him, and ever since the 'Düsseldorf School' has been associated specially with their names. S.'s principal works are 'Mignon' (1828); 'The Four Evangelists,' 'The Wise and Foolish Virgins,' 'The Source of Life,' 'The Assumption,' and 'Heaven.' 'Purgatory,' and 'Hell.' S. was ennobled in 1843. *Der Moderne Vasari* (1854) is a book from his hand. He died 19th March 1862.

SCHAFFHAU'SEN, the most northern canton of Switzerland, is bounded on all sides but the south by the duchy of Baden. Area, 116 sq. m.; pop. (1870) 37,721; (1880) 38,348, of whom about 34,000 are Protestants. The chief river is the Rhine, which forms part of the southern boundary, and within the basin of which the canton is wholly included. The surface is hilly, especially in the north and east, and of the many rich valleys that slope southward to the Rhine, that of the Klettgau is famous for its unusual fertility, and for its wines, the bouquet of which is peculiarly fine. The climate is mild; the soil, which is mostly calcareous, is generally fruitful, and agriculture is the principal branch of industry. Grain, fruits, flax, hemp, and wine are the chief crops. Iron is obtained. The sovereignty is usually exercised by the great council of 600 members, wholly renewed by ballot every 4 years; but the people have the right of veto. S. sends 2 members to the National Council.

SCHAFFHAUSEN, a town of Switzerland, capital of the canton of the same name, beautifully situated on the right bank of the Rhine, immediately above the celebrated falls of that river. Higher up the slope on which the town stands, is the curious castle of Munoth, and this edifice and the minster, founded in 1052, are the chief buildings. The town is remarkable for the antique architecture of its houses. The old wall and gateways of S. are also very picturesque. Pop. (1880) 11,795, partly engaged in the manufacture of iron, cotton, and silk goods. The *Falls of Schaffhausen*, about three miles below the town, form, perhaps, the most imposing spectacle of the kind in Europe. The river is here 300 feet broad, and the entire descent is about 100 feet. From a projecting balcony which overhangs the roaring cataract, the visitor may appreciate the full grandeur of the fall.

SCHALL, Johann Adam von, a celebrated Jesuit missionary to China, was born of noble family at Cologne in 1591, and having made his studies and entered the Jesuit order in Rome, in 1611, he was selected, partly in consequence of his great knowledge of mathematics and astronomy, to form one of the mission to China in 1620. Having, with the characteristic skill and ability of his order, turned to good account among the Chinese his familiarity with mathematical and mechanical science, he not only succeeded in forming a flourishing mission, but was ultimately invited to the imperial court at Pekin, where he was entrusted with the compilation of the calendar, and the direction of the public mathematical school, being himself created a mandarin. Such was his favor with the emperor, that, contrary to all the received etiquette, he had the privilege of free access to the presence of the Emperor Chun-Tche, the founder of the Tartar dynasty (1645), and was honored by visits from the emperor at four stated times in each year. Through this favor with the emperor, S. obtained an edict which authorized the building of Catholic churches, and the liberty of preaching throughout the empire, and in the space of 14 years the Jesuit missionaries in the several provinces are said to have received into the church 100,000 proselytes. On the death of this emperor, however, a change of policy fatal to the prospects of Christianity took place. The favorable edict above referred to was revoked; S. was thrown into prison and sentenced to death. He was afterwards liberated; but he was again imprisoned, and, at the end of a long incarceration, died August 15, 1669. He had acquired a perfect mastery of the Chinese language, in which he compiled numerous treatises upon scientific and religious subjects. A large MS. collection of his remains in Chinese, amounting to 14 volumes in 4to, is preserved in the Vatican Library. He also translated into Chinese several works, doctrinal and medical, especially some treatises of Father Lessius, a Flemish Jesuit, the most important of which was that *On the Providence of God*.—See Mailly's *Histoire Générale de la Chine* and Huc's *Le Christianisme en Chine*.

SCHÄ'SBURG, or SCHÄSSBURG (Magyar, *Segesvár*), a town of Austria, in Transylvania, on the great Kokel. It consists of the Burg or Upper-Town and the Lower-Town. Pop. (1880) 8788.

SCHAU'MBURG-LI'PPE, a sovereign German principality, includes the western part of the former county of Schaumburg, and is bounded on the W. by Westphalia, and on the N. by Hanover. Area, 170 sq. miles; pop. (1880) 35,374. Till 1866, the constitution was on the ancient patriarchal basis; but since then, S.-L. has a representative diet of 15 members, 10 of whom are elected by the towns and the country districts, the rest by the prince, the nobility, and the clergy and educated classes. It has one vote in the Federal council of the German empire, and sends one deputy to the Reichstag. The revenue of S.-L. in 1882–83 was £27,153; the expenditure just balanced it. The debt amounted to £18,000, besides £55,800 as quota towards the paper money of the empire.

SCHEELE, Charles-William, an eminent Swedish chemist, was born at Stralsund, 1742, and after receiving a brief and incomplete education, was apprenticed to an apothecary at Gothenburg, where he laid the foundation of his knowledge of chemistry. In 1767, he settled at Stockholm as an apothecary; and in 1770, removed to Upsala, where at that time the celebrated Bergmann was professor of chemistry. It was during his residence at Upsala that he carried on those investigations in chemical analysis which proved so fruitful in important and brilliant discoveries, and placed their author by the side of Linnæus and Berzelius his countrymen—in the front rank of science. In 1777, he removed to Köping to take possession of a vacant apothecary business, but died of ague-fever, 24th May 1786, at a time when he was receiving the most tempting offers from England to persuade him to settle in that country. The chief of his discoveries were tartaric acid (1770), chlorine (1774), baryta (1774), oxygen (1777), and glycerine (1784) the second-last of which had been previously made known through the labors of Priestley, though S. was not aware of this till after his own discovery of it, in 1777.

In experimenting on arsenic and its acid, he discovered the arsenite of copper, which is known as a pigment under the name of *Scheele's Green* on *Mineral Green*. In 1782, during an eminently delicate and subtle investigation to determine the nature of the coloring-matter in Prussian Blue, he succeeded in obtaining, for the first time, prussic acid in a separate form. The mode and results of his various investigations were communicated from time to time, in the form of memoirs, to the Academy of Stock-

holm, of which he was an associate, and also in his chief work, the *Chemical Treatise on Air and Fire* (1777), and in an *Essay on the Coloring Matter in Prussian Blue* (1782).

SCHEELE'S GREEN. See ARSENIOUS ACID.

SCHEFFER, ARY, a French painter, born at Dort, in Holland, 10th February 1795, studied under Guerin of Paris, and made his début as an artist in 1812. Some years later appeared his 'Mort de Saint-Louis,' 'Le Dévouement des Bourgeois de Calais,' and several *genre* pieces, such as La Veuve du Soldat,' 'Le Retour du Conscrit,' 'La Sœur de Charité,' 'La Scène d'Invasion,' &c., which have been popularized in France by engravings; but compared with his later performances, these early pictures have little merit. It was not till the 'Romantic' movement reached art that S. began to feel conscious of his peculiar power. The influence of Goethe and Byron became conspicuous in his choice of subjects, and to the remarkable facility of execution that had always marked him, he now added a subtilty and grace of imagination, that gave an inexpressible charm to his works. The public admired his new style greatly, and lavished eulogy with liberal hand on his 'Marguerite à son Rouet,' 'Faust tourmenté par le doute,' 'Marguerite à l'Eglise,' 'Marguerite au Sabbat,' 'Marguerite sortant de l'Eglise,' 'Marguerite au Jardin,' 'Marguerite à la Fontaine,' 'Les Mignons,' 'Le Larmoyeur,' 'Francesca de Rimini,' &c. Towards the year 1836, his art underwent its third and final phase—the religious. To this class belong his 'Le Christ Consolateur,' 'Le Christ Rémunérateur,' 'Les Bergers conduits par l'Ange,' 'Les Rois Mages déposant leurs Trésors,' 'Le Christ au Jardin des Oliviers,' 'Le Christ portant sa Croix,' 'Le Christ enseveli,' and 'Saint Augustin et sa Mère Sainte Monique,' some of which are well known in England by Engravings. S. also executed some remarkable portraits; among others, those of La Fayette, Béranger, Lamartine. He died at Argenteuil, near Paris, 15th June 1858.

SCHELDT, THE (pron. *Skelt;* Lat. *Scaldis*, Fr. *l'Escaut*), rises in the French dep. of Aisne, flows northerly to Cambrai, Valenciennes, Bouchain, and Condé, when entering Belgium, it passes Doornik, Oudenarde, Ghent, Dendermonde, Rupelmonde, and Antwerp, having received, among other tributaries, the Lys, Dender, and Rupel. Navigable from its entrance into Belgium, the S. at Antwerp becomes a noble river, of sufficient depth for large ships. From Antwerp, the course is north-west, to Fort Bath, in the Netherlands, where, coming in contact with the island of South Beveland, it divides into two arms. The left or southern, called the Honte or Wester S., takes a westerly direction, south of the islands of Zeeland, and meets the North Sea at Flushing; the northern or right arm, called the Kreekerak, flows between Zeeland and North Brabant, near Bergen-op-zoom, dividing again into two branches, the left, called the Easter S., passing between the islands of Tholen and Schouwen on the right, and the Bevelands on the left, reaches the sea through the Roompot (*Romanorum portus*); the other branch, flowing between North Brabant and Zeeland, discharges itself by several passages. These several mouths of the S., forming various islands, are called the Zeeland streams.

The Dutch had long monopolized the navigation of the lower S.; and by the treaty signed in London (April 19, 1839), the Netherlands secured the right of levying 2*s*. 6*d*. per ton on all vessels. By a treaty signed at Brussels July 16, 1863, this toll has been bought up, nominally by Belgium, but in reality from a sum of £750,000 paid to that country by the powers whose ships navigate the S., the proportion falling to Great Britain being fully £350,000.

SCHE'LLENBERG, a village in the south-east of Upper Bavaria, six miles south-west of the Austrian town of Salzburg, near which occurred the first battle of the 'War of the Spanish Succession,' in which the English took part. Maximilian-Emmanuel, elector of Bavaria, had fortified the hill of S. to resist the progress of Marlborough; but on July 4th, 1704, the work was attacked by the English, led on by Prince Ludwig of Baden, and carried by storm after a bloody fight.

SCHELLING, FRIEDR. WILH. JOS. VON, an illustrious German philosopher, was born at Leonberg, in Würtemberg, January 27, 1775, studied at Tübingen and Leipzig, and in 1798 proceeded to Jena, then the headquarters of speculative activity in Germany, through the influence of Reinhold and Fichte. S.'s philosophical tendencies were originally determined by Fichte; in fact, he was at first only an expounder, though an eloquent and independent one, of the Fichtian idealism, as one may see from his earliest speculative writings, *Über die Möglichkeit einer Form der Philosophie* (On the possibility of a Form of Philosophy, Tüb. 1795), *Vom Ich als Princip der Philosophie* (Of the Ego as the Principle of Philosophy, Tüb. 1795), and others. Gradually, however, S. diverged from his teacher, and commenced what is regarded as the second phase of his philosophy. Fichte's idealism now seemed to him one-sided and imperfect through its rigorous and exclusive subjectivity, and he sought to harmonize and complete it. The result of his speculations, in this direction, was the once famous *Identitätsphilosophie* (Philosophy of Identity), which claimed to show that the only true knowledge, and, therefore, the only philosophy, was that of the Infinite-absolute, in which the 'real' and 'ideal,' 'nature' and 'spirit,' 'subject' and 'object,' are recognized as absolutely the same; and which affirmed the possibility of our attaining to such knowledge by a mysterious process, known as 'Intellectual Intuition.' The 'philosophy of identity,' though only the second stage in S.'s speculative career, is the most important, and is the one by which he is best known in England—Sir William Hamilton having elaborately discussed it, and endeavored to demonstrate its untenableness in his essay on the 'Philosophy of the Conditioned' (see *Discussions in Philosophy and Literature, Education and University Reform*, 1852). The principal works in which it is more or less completely developed, are *Ideen zu einer Philosophie der Natur* (Ideas towards a Philosophy of Nature, Leips. 1797, 2d ed. 1803); *Von der Weltseele, eine Hypothese der Höhern Physik zur Erläuterung des allgemeinen Organismus* (Of the World-soul, an Hypothesis of the higher Physics in elucidation of the Universal Organism, Hamb. 1798, 3d ed. 1809); *Erster Entwurf eines Systems der Naturphilosophie* (First Attempt at a Systematic Philosophy of Nature, Jena, 1799); and *System des Transcendentalen Idealismus* (System of Transcendental Idealism, Tüb. 1800).

In 1803, after the departure of Fichte from Jena, S. was appointed to succeed him, but in the following year went to Würzburg, whence, in 1808, he was called to Munich as secretary to the Academy of Arts, and was ennobled by King Maximilian-Joseph. Here he lived for 33 years, during the last 14 of which he occupied the chair of philosophy in the newly-established university of Munich, but in 1841 he followed a call from Friedrich-Wilhelm IV. to Berlin, where he mainly resided for the rest of his life. He died at the baths of Ragaz, in Switzerland, August 20, 1854. We now revert to S.'s philosophical career. What may be regarded as its third period, if not its third phase, is chiefly marked by incessant controversy. With the exception of *Bruno, oder über das Göttliche und Natürliche Princip der Dinge* (Bruno, a Dialogue concerning the Divine and Natural Principle of Things, Berl. 1802), and the *Vorlesungen über die Methode des Akademischen Studiums* (Lectures on the Method of Academical Study, Stuttg. and Tüb. 1803), most of S.'s writings are polemical—often hotly so. The most notable are, his *Philosophie und Religion* (Tüb. 1804), in reply to Eschenmayer; *Denkmal der Schrift von den Göttlichen Dingen* (Tüb. 1812); in reply to Jacobi; and *Darlegung des Wahren Verhältnisses der Naturphilosophie zur verbesserten Fichte'schen Lehre* (Statement of the true relation of the Nature-philosophy to the improved Fichtian Doctrine, Tüb. 1806). Meanwhile, a most formidable adversary had risen up in his old college-friend, Hegel (q. v.), who was at first an ardent disciple of S.'s, just as Schelling had been of Fichte, but who had, in a similar manner, broken away, and was now pursuing an independent, and professedly antagonistic, course of speculation.

During the reign of Hegelianism, S. preserved an almost unbroken silence. For more than 20 years he published almost nothing, but we know that he was far from being idle. He was observing narrowly the practical as well as the speculative results of the rival system, and maturing his own philosophy for the final phase which it assumed, and which he called variously, the 'positive,' the 'historical,' and the 'system of Freedom'—the design of which was to interpret, at once philosophically and reverentially, the history, and, especially, the religious history of mankind. S. admitted that his earlier speculations, though sound in themselves, attained only to 'negative' truth, and to show that the most transcendental metaphysician need not be a Pantheist, but might be a believer in a Personal God, or even in a Trinity, with a whole Augsburg Confession to boot, he began to apply or develop in a practical way what he conceived to be the principles of his system. It cannot be said that the result has proved satisfactory, though many of his contemporaries thought it would—Neander, for example, dedicating to him, in the most eulogistic terms, the first volume of his *Kirchengeschichte*, on the ground that it was in harmony with S.'s new philosophy. The writings that contain the fruits of S.'s latest thinking were for the most part posthumously published, although a general idea of them had become known to the public through such lectures as those on the *Philosophy of Mythology*, and the *Philosophy of Revelation*. S.'s *Sämmtliche Werke* (14 vols., Stuttg. 1856—1861) were edited by his sons, Karl Friedr. Aug. and Hermann Schelling. His Correspondence was published at Munich in 1863. Various French writers, such as MM. Matter, Remusat, Cousin, Michelet, have tried (with indifferent success) to explain the great mystic to their countrymen; and English philosophical literature is dubiously associated with his name, through what may be called the somnambular plagiarisms of a kindred genius, Samuel Taylor Coleridge. These were first

pointed out by Professor Ferrier in *Blackwood's Magazine*, March 1840.

SCHE'MNITZ, the largest and most famous mining town of Hungary, stands in a narrow mountain gorge, at the height of 1054 feet, on a river of the same name, 70 miles north of Pesth. Together with its six suburbs, some of which, however, are at a distance of several miles, it has a pop. of 22,000; but the town proper has only (1869) 14,029 inhabitants. The academy for mining and wooderaft, embracing collections of minerals and a chemical laboratory, is the principal building, and forms the chief architectural feature of the town. It is attended by about 200 students, who receive lessons from six professors. A highly-esteemed kind of tobacco-pipe heads are manufactured here. The mines, which extend under the town, have been worked for centuries, though recently they have yielded but an inconsiderable profit. They produce gold and silver, as well as copper, iron, and sulphur. One of the passages is more than 9 miles long. Twelve of the mines belong to the crown, the others are private property.

SCHENE'CTADY, a city of New York, U. S., on the Erie Canal and the south bank of the Mohawk River, 16 miles northwest of Albany. It is the seat of Union College, and contains 17 churches, 4 banks, 6 newspapers, large machinery and locomotive works, 4 foundries, cotton-mills, and manufactories of shawls, agricultural implements, &c. S. was settled by the Dutch in 1661. In 1690, a large number of the inhabitants were massacred by the French and Indians. Pop. (1870) 11,026; (1880) 13,675.

SCHE'RZO (Ital. jest, sport), in Music. A term applied to a passage or movement of a lively and sportive character, forming part of a musical composition of some length, as a symphony, quartett, or sonata.

SCHE'VENINGEN (pron. *Skaveningen*), a populous and thriving village in South Holland, is situated on the coast of the North Sea, about two miles from the Hague. Pop. about 8500. Fishing is the chief industry; ship-building, rope-spinning, and making sailcloth, being also carried on. It is the most fashionable seabathing resort in the Netherlands, and is visited by many distinguished strangers, there being an excellent 'Bath House,' and other hotels. In the neighborhood, are summer residences of the royal family and nobility. A range of sand hills defends the village from the sea, which has, nevertheless, made so great encroachments that the Protestant church, originally built in the center, is now close by the strand. The road from the Hague to S. is a long avenue of fine trees and wooded banks, with a tramway for passengers and goods.

SCHIEDA'M, a town in S. Holland, situated on the Schie, which is connected with the Maas by a canal. Pop. (1875) 21,103, of whom nearly two-thirds are Protestants. The streets are narrow, irregularly built, and, compared with other Dutch towns, have a dirty appearance, from the distilleries, malting-works, and grain-mills. Gin is so largely manufactured that the air and water smell and taste of it. In 1875, 418,572 hectolitres of spirits were produced, the grain-mills and malt-works giving 24,040,771 kilogrammes of rye-meal, and 21,150,331 of malt. The neighboring meadows are rich in cattle, partly fed from distillery refuse. Imported 660,000 hectolitres rye, 900,000 barley, 17,670 wheat, &c.; exported 54,940 hectolitres of spirits, 7,600,000 kilos of yeast, &c. The sterine factory used 4,700,000 kilos tallow and palm oil, producing 1,405,000 kilos stearine in cakes, 1,825,000 kilos candles, 1,404,000 oleine, and 244,500 of glycerine. Beer-brewing, metal-founding, basket-making, cork-cutting, &c., are carried on.

SCHILLER, JOHANN CHRISTOPH. FRIEDRICH VON, one of the greatest poetical geniuses of Germany, was born at Marbach, a little town of Würtemberg, on November 11, 1759. His father, Joh. Kaspar Schiller, was overseer of the nurseries attached to a country-seat of the Duke of Würtemberg. S. received his first formal instruction from the parish priest Moser, at Lorch; and in 1773, the duke, who had formed a favorable opinion both of S. and his father, offered to educate the boy, free of expense, at the military academy founded by him at the castle of Solitude, and afterwards transferred to Stuttgart under the name of Karlsschule. The offer was accepted, and entering the rigorous academy, S. tried to devote himself to jurisprudence. His success in the new study was small, and after two years, he exchanged it for medicine. But literature, especially poetry, was the secret idol of his soul, and its chief delight. Already the characteristics of his genius—his tendency towards epic and dramatic idealism—were showing themselves in his predilections. His first literary attempts of any moment were dramatic—*Der Student von Nassau* and *Cosmus von Medici*—which were consigned (doubtless not without reason) to the fire. Meanwhile, the poet's general intellectual culture and his professional studies went steadily on; and in 1780, he passed as a military surgeon, but with no liking for such a career. In 1778, S. completed the first sketch of his memorable drama, *Die Räuber* (The Robbers), the publication of which, in 1780, excited the most violent enthusiasm among the young all over Germany, so wild, and strong, and glowing were the passion and fancy displayed in it. Respectable people, dignitaries, functionaries, and the like, were, of course, deeply scandalized; and the duke himself, a 'Serene Highness' sort of man, was induced to lecture the poet on his delinquency, and forbade him to write any more poetry 'without submitting it to *his* inspection!'

In 1782, *The Robbers* was brought upon the stage at Mannheim—the poet being present without the knowledge of his superiors, the result of which was arrest for a fortnight! This led to further complications; and finally, in October of the same year, S. fled from the harsh service of the duke into Franconia, and lived for a year under a feigned name at Bauerbach, near Meiningen, where he completed his *Fiesco* and *Cabale und Liebe*, begun at Stuttgart. *Don Carlos* was also sketched in outline here. In September 1783, he went back to Mannheim, and was for some time closely connected with actors and theatrical life. To this period belong several of his lesser poems. With the *Cabale und Liebe* above mentioned ended the first poetic period in S.'s career, otherwise known as the *Sturm und Drang* period, in which a burning energy of passion and a robust extravagance, passing often into sheer bombast of speech, are the predominant characteristics. In March 1785, S. left Mannheim, and proceeded to Leipzig, where he became acquainted, among others, with Huber and Körner, and wrote his beautiful *Lied an die Freude;* thence, after a few months, he went to Dresden, where he began the practice of composing during the night, which so fatally assisted in shortening his life. *Der Geisterseher* (The Ghost-seer), a strikingly powerful romance, was written here; and the drama of *Don Carlos* was completed. In 1787, he was invited to Weimar, and was at once warmly received by Herder and Wieland; but some years elapsed before Goethe and he could unders and one another; after that, they became the closest friends. Henceforth, S. owed more to Goethe than to all other men: we may even call the later and best writings of S. inspirations of Goethe. The study of the spirit and literature of antiquity in particular exercised a wholesome influence over him, and in his *Götter Griechenlands* (Gods of Greece), which belongs to this stage, we see how calm, and clear, and sunny his once turbid and stormful imagination was gradually becoming. Reinhold of Jena introduced him to the Kantian philosophy, and for some little time S. was in danger of lapsing from a poet into a metaphysician.

The philosophical and æsthetic treatises springing out of this new study were collected and published under the title of *Kleine prosaischen Schriften* (4 vols., Jena, 1792—1802). His *Geschichte des Dreissig-jährigen Kriegs* (History of the Thirty Years' War) originally appeared in the *Taschenkalender für Damen* (1790—1793). On the occasion of the poet's marriage in 1790 with Charlotte von Lengefold, the Duke of Meiningen made him a *Hofrath* (privy-councillor); the French Republic also conferred on him the right of citizenship; and in 1802, the emperor raised him to the rank of nobility. While staying for a year with his relatives in Würtemberg, he wrote his exquisite *Briefe über ästhetische Erziehung* (Letters on Æsthetic Culture). This period, reaching to the close of 1794, is generally regarded as S.'s *transition* period; in poetic accomplishment, it is not rich, but in earnest, thoughtful, and manifold speculation it was highly important to the poet, and we find that it prepared the way for the last and most splendid development of his genius. After 1795, the finest of his lyrics and dramas were produced—as *Der Spaziergang* and the *Lied der Glocke* (Song of the Bell) in 1796, *Wallenstein* (1799), *Maria Stuart* (1800), *Die Jungfrau von Orléans* (1801), *Braut von Messina* (Bride of Messina, 1803), and finally his greatest drama, *Wilhelm Tell* (1804). But his health had been long giving way, partly owing to a natural weakness of constitution, and partly to incessant application to study; and on May 9, 1805, he expired, at the early age of 46. Ever since his death, the fame of S. has been on the increase; he has long been recognized as, next to Goethe, the greatest poet that Germany has produced, and innumerable editions of his works have been published. See *The Life of Friedrich S.* by Carlyle (1825). There are numerous German biographies, the best being Düntzer's *S.'s Leben* (1880).

SCHINKEL, KARL FRIEDR., a German architect of great celebrity in his own country, was born at Neuruppin, March 13, 1781, and studied the principles of drawing and design at Berlin under Professor Gilly. In 1803, he went to Italy to extend his professional knowledge; but on his return in 1805, he found the aspect of public affairs so threatening that he could obtain little employment, and was forced to betake himself to landscape-painting. In May 1811, he was elected a member of, and in 1820 a professor at, the Berlin Academy of Arts. Other offices and honors were also conferred on him. He died October 9, 1841. The designs to which he chiefly owes his reputation are those of the Royal Guard-house, the Memorial of the War of Liberation, the New Theater, the New Potsdam Gate, the Artillery and Engineers' School, in Berlin; the Casino, in Potsdam; another in the

gardens of Prince Karl at Blienike, near Potsdam; and a great number of castles, country-houses, churches, and public buildings. S. was a man of powerful and original genius; his designs are remarkable for the unity of idea by which they are pervaded, and the vigor, beauty, and harmony of their details.—See Kugler's *Karl Friedr. Schinkel* (Berl. 1842).

SCHI'NUS, a genus of trees and shrubs of the natural order *Anacardiaceæ*, natives of South America. The leaves so abound in a resinous or turpentine-like fluid, that upon the least swelling of the other portions of the leaf by moisture, it is discharged from the sacs which contain it. Thus they fill the air with fragrance after rain, or if thrown into water, start and jump about as if alive, discharging jets of this peculiar fluid. The same phenomenon is exhibited by the leaves of some species of the kindred genus *Duvauo*, of which specimens are occasionally to be seen in our greenhouses. The leaves and twigs when bruised have a very strong odor of turpentine.

SCHISM, GREEK, the separation between the Greek and Latin churches, which originated in the 9th, and was completed in the 12th century. See GREEK CHURCH.

SCHISM, WESTERN, a celebrated disruption of communion in the Western Church, which arose out of a disputed claim to the succession to the papal throne. On the death of Gregory XI. in 1378, a Neapolitan, Bartolomeo Prignano, was chosen pope by the majority of the cardinals in a conclave at Rome under the name Urban VI. Soon afterwards, however, a number of these cardinals withdrew, revoked the election, which they declared not to have been free, owing to the violence of the factions in Rome by which the conclave had, according to them, been overawed; and, in consequence, they proceeded to choose another pope under the name Clement VII. The latter fixed his see at Avignon, while Urban VI. lived at Rome. Each party had its adherents, and in each a rival succession was maintained down to the council of Pisa in 1410, in which assembly both were deposed, and a third pope John XXIII., was elected. This measure not having been acquiesced in by all, a new council was convened at Constance in 1417, in which not alone the former rivals, but even the new pontiff elected, by consent of the two parties, at Pisa, were set aside, and Otho Colonna was elected under the name of Martin V. In this election the whole body may be said to have acquiesced; but one of the claimants, Peter de Luna, called Benedict XIII., remained obstinate in the assertion of his right till his death in 1430. The schism, however, may be said to have terminated in 1417, having thus endured nearly 40 years.

SCHI'SMA, the name given to one of the very small intervals known in the theory of music, which amounts to the difference between the *Comma ditonicum* and *Comma syntonicum*. See COMMA.

SCHIST (Gr. *schistos*, split), is a term applied somewhat loosely to indurated clays, as bituminous schist and mica schist. It is more correctly confined to the metamorphic strata, which consist of plates of different minerals, as mica schist, made up of layers of quartz separated by laminæ of mica; chlorite schist, a green rock in which the layers of chlorite are separated by plates of granite or felspar; and hornblende schist, a black rock composed of layers of hornblende and felspar, with a little quartz.

SCHLA'NGENBAD, one of the most distinguished spas of Germany, on the northern frontier of the Rheingau district, 6 miles west of Wiesbaden, in a beautiful and secluded situation, embosomed amid wooded hills. The water of the baths has a temperature of 80° F., and contains the muriates and carbonates of lime, soda, and magnesia, with a slight excess of carbonic acid. The baths have a marvelous effect in beautifying the skin, and in soothing and tranquillizing. The village is itself very small, and in the height of the season the pop. is only about 2000.

SCHLEGEL, AUGUST WILHELM VON, a distinguished critic, poet, and scholar, was born at Hanover, 8th September 1767, and studied at Göttingen, where he acquired a reputation by his devotion to philological and classical studies. He first began to assume a prominent position in literature, while a lecturer at Jena, contributing assiduously to Schiller's *Horen* and *Musen-Almanach*, and to the *Allgemeine Literaturzeitung*. About the same time, his translation of Shakspeare began to appear (9 vols. Berl. 1797—1810), the influence of which on German poetry and the German stage was equally great. Subsequently, the poet Tieck, with S.'s consent, undertook a revision of the work, together with a translation of such pieces as S. had omitted (12 vols. Berl. 1825, 1839, 1843); and from their conjoint labors, the people of Germany are able to form a faithful idea of the surpassing genius of our countryman. S. also delivered at Jena a series of lectures on æsthetics, and along with his brother, Friedrich, edited the *Athenaeum* (3 vols. Berl. 1796—1800), which in spite of, perhaps because of, the severity of its criticism, gave a lively and wholesome impulse to the poetry of its time. He published, besides, his first volume of poems (*Gedichte*, Tüb. 1800); and, again in company with his brother, the *Charakteristiken und Kritiken* (2 vols. Königsb. 1801).

In 1802, S. left Jena for Berlin, where he gave a second series of lectures on literature, art, and the spirit of the time. Next year appeared his *Ion*, an antique tragedy of considerable merit. It was followed by his *Span. Theater* (2 vols. Berlin, 1803—1809), consisting of five pieces of Calderon's, admirably translated, the effect of which has been to make that poet quite a favorite with the German people; and his *Blumensträusse der Ital., Span., und Portug. Poesie* (Berl. 1804), a charming collection of lyrics from the sunny south from the appearance of which dates the naturalization in German verse of the metrical forms of the Romanic races. Probably his most valuable, and certainly his most widely popular work, was his *Vorlesungen über dramatische Kunst und Literatur* (3 vols. Heidelb. 1809—1811), originally delivered at Vienna, in the spring of 1808, and translated into most European languages. During 1811—1815, S. published a new collection of his poems (*Poetische Werke*), which contains his masterpieces, 'Arion,' 'Pygmalion,' 'St. Lucas,' and is notable for the richness and variety of its poetic forms, as also for the singular facility and elegance of the versification. In 1818, S., now raised into the ranks of the nobility, and privileged to use the sacred *von* before his name, was appointed Professor of History in the university of Bonn, and devoted himself especially to the history of the fine arts and to philological research. He was one of the first students of Sanscrit in Germany, established a Sanscrit printing-office at Bonn, and an *Indische Bibliothek* (2. vols. Bonn, 1820—1826). Among the proofs of his scholarly activity in this department of knowledge, may be mentioned his edition of the *Bhagavad Gîta*, an episode from the epic poem, *Mahâbhârata*, with a Latin translation (2d ed. Bonn, 1846), and of part of the *Râmâyana* (Bonn, 1829—1839). His other works it is unnecessary to mention. S. was not happy in his domestic relations. He was twice married first to a daughter of Professor Michaelis of Göttingen, and again to a daughter of Professor Paulus of Heidelberg, but in both cases a separation soon became necessary. S. was quarrelsome, jealous, and ungenerous in his relations with literary men, and did not even shrink from slander when his spleen was excited. He died 12th May 1845.

SCHLEGEL, KARL WILHELM FRIEDRICH VON, distinguished both for his scholarship and intellectual ability, was a brother of the preceding, and was born at Hanover, 10th March 1772. He studied at Göttingen and Leipzig, and in 1797, published his first work, *Griechen und Römer* (The Greeks and Romans), which won praise from old Heyne. It was followed in the course of a year by his *Geschichte der Poesie der Griechen und Römer* (History of Greek and Roman Poetry), a sort of fragmentary continuation of the former. Both of these productions bore evidence of rich learning, independent thought, and a thorough appreciation of the principles and method of historic criticism; but the chief vehicle at this time for the dissemination of his philosophical views of literature was the sharp-fanged periodical called the *Athenaeum*, edited by himself and his brother, August Wilhelm. Proceeding to Jena, he started there as a *privat-docent*, holding lectures on philosophy, which met with great applause, and still editing the *Athenaeum*, to which he also began to contribute poems of a superior quality, and in the most diverse metres. In 1802, appeared his *Alarkos*, a tragedy in which the antique-classical and new-romantic elements are singularly blended. From Jena, he soon went to Dresden, and thence to Paris, where he gave a few more of those philosophical prelections, in the manufacture of which both he and August Wilhelm were unhappily much too expert; edited the *Europa*, a monthly journal (2 vols. Frankf. 1803—1805); and applied himself assiduously to the languages of Southern Europe, and still more assiduously to Sanscrit, the fruits of which were seen in his treatise, *Ueber die Sprache und Weisheit der Indier* (Heidelb. 1808). See PHILOLOGY.

During his residence in Paris, he also published a *Sammlung Romantischer Dichtungen des Mittelalters* (Collection of Medieval Romantic Poems, 2 vols. Par. 1804), and the pious-chivalric romance of *Lother und Maller* (Berl. 1805). On his return to Germany, he published a volume of dithyrambic and elegiac poems (*Gedichte*, Berl. 1809). At Cologne, he passed over to the Roman Catholic Church, a change to which his medieval studies powerfully contributed, and which, in its turn, no less powerfully affected his future literary career. In 1808, S. went to Vienna, where, in 1811, appeared his *Ueber die neuere Geschichte* (Lectures on Modern History), and in 1815, his *Geschichte der alten und neuen Literatur* (History of Ancient and Modern Literature). In 1822, a collected edition of his writings, in 12 vols. (*Sämmtliche Werke*), was published by himself. Subsequently, he delivered two series of lectures, one on the Philosophy of Life (*Philosophie des Lebens*, Vienna, 1828), and another on the Philosophy of History (*Philosophie der Geschichte*, Vienna, 1829), both of which are well known in England and other countries through the medium of transla-

tions. S. died 12th January 1829. His MSS. were published by his friend Windischmann (2 vols. Bonn, 1836—1837).

SCHLEIERMACHER, Friedrich Ernst Daniel, one of the greatest and most influential theologians of modern times, was born at Breslau, 21st November 1768. His boyish years were spent in the school kept by the Moravian brotherhood at Niesky, and here he first received those religious impressions the influence of which was visible in his whole after-life. In 1787, he proceeded to the university of Halle; and on the conclusion of his academic course, acted for some time as a teacher; but in 1794 became assistant-clergyman at Landsberg-on-the-Warthe, where he remained for two years. He then went to Berlin, and occupied himself partly in the translation of some of Blair's and Fawcett's Sermons, and in the redaction of the *Athenaeum*, conducted by his friend Friedrich Schlegel; but the first work that won for him general celebrity was his *Reden über die Religion* (Discourses on Religion, Berl. 1799), which startled Germany from its spiritual torpor, vindicated the eternal necessity of religion, and sought to separate those elements of it that are essentially divine from the incrustations of dogma and the formalities of practice.

Neander looked upon these *Reden* as making the turning-point in his spiritual career. They are now regarded as both making and marking an epoch in the theological history of Germany. The *Reden* were followed by the *Monologen*, and the *Briefe eines Predigers ausserhalb Berlin* in 1800. Two years later, he was appointed preacher at the Charity-house in the Prussian capital; and during 1804—1810, produced his famous translation of Plato, with commentary, which is considered in Germany, to this day, the most profound and penetrating treatise on the philosophy of the great Athenian, though English scholars are disposed to regard its criticism as decidedly too subjective, and in many important respects baseless. In 1801 appeared the first collection of his *Predigten* (Sermons), followed between 1808—1833 by no fewer than six other collections. They are masterpieces of penetrating and eloquent discussion, appealing equally to the heart and the intellect of hearers and readers. In 1802, S. went as court-preacher to Stolpe, where he published his *Grundlinien einer Kritik der bisherigen Sittenlehre;* and in 1804, was called to Holle as University-preacher and Professor of Theology and Philosophy. In 1807, he returned to Berlin, having previously published *Die Weihnachtsfeier, ein Gespräch* (Christmas Festival, a Dialogue, Halle, 1806), bearing on the calamitous state in which Germany then found herself, owing to the victorious insolence of the French. Among his next publications may be mentioned *Ueber den sogenannten ersten Brief des Paulus an den Timotheus* (Concerning the so-called first Epistle of Paul to Timothy, Berl. 1807). In 1809, he became pastor of Trinity Church, Berlin; and in 1810, when the university of Berlin was reopened, with a brilliant array of professors, under the rectorship of Fichte, no name shone more conspicuous than that of Schleiermacher. In 1811, he was chosen a member of the Berlin Academy of Sciences, in whose Transactions are to be found many valuable papers by S. on the ancient philosophy; and in 1814, secretary of the philosophical section.

In 1817, he was appointed president of the synod assembled in Berlin. His latest, and perhaps his most important work is *Der Christliche Glaube nach den Grundsätzen der Evang. Kirche im Zusammenhange dargestellt* (The Christian Faith systematically presented according to the fundamental Propositions of the Evangelical Church, 2 vols. Berl. 1821—1822), in which his deepest and most Christian thought is visible. He died at Berlin, 12th February 1834. The list of S.'s disciples—i. e., of men who have derived the groundwork of their principles from him—is one of the most splendid that any theological reformer could show, embracing, among others, the names of Neander, Nitzsch, Twesten, Olshausen, Lucke, Bleek, and Ullmann. In 1864, appeared a posthumous work of S., *Das Leben Jesu, Vorlesungen an der Universität zu Berlin im Jahr* 1832, in which he conceives of Jesus, as a man in whom the divine spirit works as perfectly as it possibly can in humanity, and treats his history accordingly. Strauss has replied in a critique (Berl. and Lond. 1865). S. was very far from what in England is called orthodox, but he was a great, earnest, devout Christian man, of massive understanding, and whose eloquence was scarcely less golden than that of Plato himself. Germany overflows with literature on S., his system, and his ideas.—Among the more important works on S. are Dilthey's *Leben S.'s* (vol. i. 1870); *Aus Schleiermacher's Leben in Briefen* (1858; Eng. transl. 1860); Bender's *S.'s Theologie* (1878); Lang, *Religiöse Charactere* (1862).

SCHLESWIG. See Slesvig.

SCHLETTSTADT (French, *Schlestadt*), a town of Lower Alsace, on the left bank of the Ill, 26 miles south-west of Strasburg. Till the war of 1870—71, S. was a French fortress of the third class. It was bombarded and compelled to capitulate, 24th Oct. 1870. The fortifications have been demolished. Pop. (1875) 9094; (1880) 8979.

SCHLOSSER, Friedr. Christoph, a distinguished German historian, was born at Jever, 17th November, 1776, educated at Göttingen, and after spending many years as a private tutor and academic teacher, he was, in 1817, called to Heidelberg as a Professor of History, where he died, September 23, 1861. His principal writings (arranged in the order of time) are *Abälard und Dulcin* (Gotha. 1807); *Leben Beza's und des Peter Martyr Vermili* (Heidelb. 1809); *Geschichte der Bilderstürmenden Kaiser des Oeström Reichs* (Frankf. 1812); *Weltgeschichte in Zusammenhängender Erzählung* (Frankf. 1817—1824); *Geschichte des* 18 *Jahrh.* (Heidelb. 1823); *Universalhistorische Uebersichte der Geschichte der Alten Welt und ihrer Cultur* (Frankf. 1826—1834); *Weltgeschichte für das Deutsche Volk* (1844—1853); and *Studien über Dante* (1856). Of these works, the most notable are the *Geschichte des* 18 *Jahrh.*, continued by S. in the later editions till the fall of Napoleon, and the *Weltgeschichte für das Deutsche Volk*, which have been translated into English and other tongues. S. is a keen, critical, and powerful writer, who judges men and events by a stern ethical standard.

SCHMALKALD, League of, the name given to the defensive alliance concluded provisionally for nine years at Schmalkalden (q. v.), 27th February, 1531, between nine Protestant princes and eleven imperial cities, with whom other five princes and ten imperial cities subsequently made common cause; and the Elector of Saxony and the Landgrave of Hesse were appointed chiefs of the league, and empowered to manage its affairs. The object of this formidable alliance, which included the whole of Northern Germany, Denmark, Saxony, and Würtemberg, and portions of Bavaria and Switzerland was for the common defence of the religion and political freedom of the Protestants against the Emperor Charles V. and the Catholic states. The league was not rendered superfluous by the religious peace of Nürnberg in 1532, and on the rumor that the emperor was meditating new hostile measures against the Protestants, another meeting of the confederates was held 24th December, 1535, which resolved to raise a permanent army of 10,000 foot and 2000 cavalry, and to prolong the league for ten years.

The confederation was further consolidated by articles of guarantee which were drawn up by Luther at Wittenberg in 1536, and being subscribed by the theologians present at the meeting of the league at Schmalkalden in February 1537, were called the *Articles of Schmalkald*. Against the league, the emperor, engaged as he was at the time in contests with the Turks and French, found himself unable to contend, though supported by the Holy League, a Catholic confederation formed in 1538, in opposition to the Protestant one. But impolitic management, mutual jealousies, and conflicting petty interests, dissipated their energies, and prevented united action. The 'War of Schmalkald' commenced by the advance of the army of the league, under Sebastian Schärtlin, into Swabia, to bar the approach of the imperial army from Italy. Schärtlin forced his way to the banks of the Danube, but the miserable jealousy of the Saxon princes paralyzed his action. The emperor, by a proclamation bearing date 20th July 1546, put the two chiefs of the league under the ban of the empire; Maurice, Duke of Saxony, took possession of the electorate, by virtue of an imperial decree; and the Protestant army was forced to retreat. The Elector of Saxony reconquered his electorate in the autumn of 1546, but meantime the imperial army subdued the northern members of the League of S., and advanced into Franconia to meet the combined armies of Saxony and Hesse. The latter were totally routed at Mühlberg (24th April 1547), and both chiefs fell into the emperor's hands. This defeat, which has been ascribed to treason, and was perhaps as much owing to this cause as to weakness, finished the war. The object of the league, the guarantee of the liberty of religion to the Protestants, was subsequently effected by Maurice, now Elector of Saxony, who, by a brilliant feat of diplomacy and generalship, compelled the emperor to grant the treaty of Passau (31st July 1552), by which this freedom was secured.

SCHMA'LKALDEN, an old and interesting town of Hessen-Nassau, Prussia, at the confluence of the Stille and Schmalkald, 11 miles north of Meiningen. It is surrounded with double walls, contains two castles, and carries on considerable mining operations, especially in iron, and various manufactures, the chief of which are hardwares. Pop. (1880) 6452.

SCHNEE'BERG, a pleasantly-built and important mining town of Saxony, surrounded by mountains, 20 miles south-west of Chemnitz. The principal products of the mines are silver (though not in its former great abundance), cobalt, bismuth, and nickel, iron, &c. Cloth, shoes, and cigars are manufactured. Pop. (1880) 7642.

SCHNEE'KOPPÉ, the culminating point of the mountain chain of the Riesengebirge. See Bohemia.

SCHOLARSHIP, a benefaction, generally the annual proceeds of a bequest permanently invested, paid for the maintenance of a student at a university. At the university of Oxford there are

37, and at Cambridge, 43 scholarships; their values ranging from £20 to £100 per annum. In both universities, the scholars are chosen from the undergraduates, and are often elected before they have begun their attendance at the university. They are on the foundation, but their connection with the college is not so intimate as that of the Fellows. The regulations under which they are placed, and the advantages which they enjoy, differ in the different colleges. A number of the scholarships which were formerly restricted have recently been thrown open to public competition. The Bursaries (q. v.) of the Scottish universities are nearly analogous to the Scholarships of the English.

SCHOLA'STICS, or SCHOOLMEN, originally the name given to the teachers of rhetoric at the public schools under the Roman empire, but now used almost exclusively to denote the so-called philosophers of the middle ages. After the fall of the old classic civilization, there ensued a long anarchy of barbarism, lasting from the 6th to the 8th c.; but from the time of Charlemagne, a visible improvement took place. That great monarch encouraged learning; and the monasteries as well as the schools which he established, became subsequently the seats of a revived culture of philosophy. Conformably, however, to the spirit of a time in which learning and literary skill were confined to churchmen, philosophical activity showed itself chiefly in the domain of theology. This preparatory period of scholasticism—say from the 9th to the 11th c.—embraces the distinguished names of Johannes Erigena Scotus (see ERIGENA), who cannot, however, be properly classed among the Scholastics; Gerbert of Aurillac, afterwards Pope Sylvester II. (q. v.); Berengarius (q. v.) of Tours; and Lanfranc (q. v.), Archbishop of Canterbury. A further development of Scholasticism occurred towards the middle of the 12th c., when Roscelinus opened up the question concerning the nature of universal conceptions, which led to the great struggle between the *Nominalists* (q. v.) and *Realists* (q. v.). This struggle terminated in the triumph of the latter; and henceforth, during the golden age of Scholasticism (the 12th and 13th centuries), it continued to be the prevalent mode of thought in philosophy. Still, however, Scholasticism regarded philosophy as dependent on theology. No one dreamed of doubting, or at least of disputing the truth of any of the church doctrines. These were alike too sacred and too certain to be so handled, and the only thing left for a humble philosopher to do was, in fact, to sort and systematize them: hence the expression *philosophia theologiæ ancilla* (philosophy is the handmaid of theology), which has found its way down to modern times.

Whatever did not directly belong to ecclesiastical dogma, was either neglected or treated in accordance with the vague traditions of Platonic or Aristotelian thought handed down from antiquity. Hence sprung that vast array of artificial subleties and distinctions which had no better foundation to rest on than gross ignorance of the matters discussed, combined with a restless speculativeness. The formulas of logic were abused through an irrational realism, which regarded them not only as a means to the attainment of philosophical knowledge, but as the material organon of philosophy itself. At first, the dialectic treatment of dogma was only fragmentary, as we see it in the principal Scholastics of the 12th c., Gilbert de la Porrée, Alanus ab Insulis, and Petrus Lombardus (q. v.). During the 12th c., however, the increased intercourse of the West with the Arabs and Greeks led to a more definite acquaintance with the physical and metaphysical writings of Aristotle, though still only through the medium of incomplete translations, and in this way the circle of vision of the Scholastics at least widened, if it did not become clearer. From this period dates the almost *papal* authority of the great Stagyrite in philosophy, and the rise of the vast and elaborate systems of medieval theology. The three chiefs of Scholasticism is this, its highest development, were Albertus Magnus (q. v.), Thomas Aquinas (q. v.), and Duns Scotus (q. v.); around each of whom stand groups of more or less independent scholars and followers. The celebrity of such teachers was largely increased by the want of books, which compelled their pupils to rely upon their oral communications, and necessitated those extraordinary public disputations which were the only means 'philosophers' had of advertising their wares in the middle ages. The honor paid to them by their admirers is visible in the epithets attached to their names; thus, Alanus is the *Doctor universalis;* Alexander Hales (q. v.), the *Doctor irrefragabilis;* Duns Scotus, the *Doctor subtilissimus;* Thomas Aquinas, the *Doctor angelicus;* Guilaume Durand of St. Pourcain, the *Doctor resolutissimus,* &c.

With Thomas Aquinas and Duns Scotus, Scholasticism culminated. After their time, various causes co-operated to bring about its decline and fall. The mystical theology (see MYSTICISM) gradually developed its natural antagonism to speculations resting on a basis of formal logic, and not appealing to the human heart and spirit. Such men as St. Bernard (q. v.) of Clairvaux, and the monks of St. Victor at Paris, in the 12th c.; together with Bonaventura, in the 13th, were unconsciously hostile to the dominant style of thought; while in the 14th and 15th centuries, Tauler, Thomas à Kempis, Gerson, Nicholas of Clemangis, and others, deliberately set themselves against it. The very nature of the Scholastic thought was inimical to its own perpetuity. The hyper-logical, hair-splitting course which it followed produced rival systems, and results discordant with the doctrines of that theology which it undertook to support, until it finally laid down the astounding proposition, that a thing might be philosophically true and theologically false, and *vice versâ*. The quarrels of the two great orders—The Dominicans and the Franciscans—each of which took part with its metaphysical chief; the former being called Thomists (from Aquinas), and the latter, Scotists (from Duns Scotus), materially injured the common cause of Scholasticism; and the revival of Nominalism under William of Occam (q. v.), its most distinguished advocate, powerfully contributed to the same result; but it was not till after the revival of letters had done its work of enlightening the judgment and purifying the taste of Europe, that Scholasticism was visibly in danger.

The reformation shook the system to its foundations—Luther himself leading the assault with the strength and valor of a Cœur-de-Lion; but still, so tenaciously did it cling to the semblance of life, that in the universities it held its footing till the 17th c., and even later. In fact, in some Roman Catholic states, such as Spain, it is still almost the only kind of philosophy going. The two great intellectual reformers whose writings mark the transition from the medieval to the modern mode of thought, are Lord Bacon (q. v.) and Descartes (q. v.), who may be said to have administered the death-blow to Scholasticism. The literature of this phase of speculation is enormous, and few critics have ventured far into its cob-webbed regions. For example, the printed writings of Albertus Magnus, Thomas Aquinas, and Duns Scotus, amount to 51 folio volumes; but however glad we may be that the reign of Scholasticism is over, and however thankful to men like Laurentius Valla, Erasmus, Rudolf Agricola, and Ramus, who riddled its ancient and time-honored flag with the sharp shot of their wit and logic, we ought never to forget, that in ages when the conditions of scientific knowledge or refined taste did not exist, these old monkish dialecticians kept alive the philosophical faculty in Europe by the vivacity and restless ingenuity with which they prosecuted their fantastic speculations.

SCHOMBURGK, SIR ROBERT HERMANN, a celebrated traveler, was born at Freiburg in Prussian Saxony, June 5, 1804. He began at an early age to apply himself to geographical science and natural history, and subsequently made an abortive attempt to succeed as a tobacco-manufacturer in Virginia, United States. In 1830, he went to Anegada, one of the Virgin Isles, and having, by the advice of the governor, carefully surveyed the island, and laid a report before the Royal Geographical Society, he was charged by that learned body with the survey of Guiana in 1835. This enterprise, which was surrounded with formidable difficulties, he satisfactorily achieved, and from time to time laid the results of his investigations before the Society, in whose *Journal* they were regularly published. It was during this exploration, and while he was ascending the Berbice River, that he discovered, January 1, 1837, the magnificent aquatic plant denominated the *Victoria regia* (q. v.).

On his return to England in 1839, he was presented with the medal of the Geographical Society for his *Travels and Researches in British Guiana in* 1835—1839 (Lond. 1840), a work which largely contributed to almost every branch of natural science. In 1840, he returned to Guiana, this time under the auspices of the British government, to complete his survey of that country, and survey the boundary-line between it and Brazil; and on his return in 1844, after the completion of his labors, he received the honor of knighthood. The *Description of British Guiana,* a valuable work, was the fruit of this expedition. In 1847, he published an excellent and elaborate *History of Barbadoes,* and in the following year departed for San Domingo, whither he had been accredited as British consul and representative. In this new sphere, he continued to pursue his geographical and scientific researches, the results of which he communicated in Reports to the Geographical Society till 1853. In 1857, he was appointed British representative to the Siamese court. He returned ill in 1864, and died next year.

SCHÖNBEIN, CHRISTIAN FRIEDRICH, a German chemist, was born at Mitzingen in Würtemberg, 18th October 1799, studied natural science at Tübingen and Erlangen, and in 1824—1825 taught chemical physics at Keilhau, near Rudolstadt. To increase his knowledge, he visited England in 1826, repairing thence to Paris; and in 1828 he was called to a chair in the university of Basel, where his eminent qualifications were speedily recognized. In 1839, he discovered *Ozone* (q. v.), and invented *Gun-cotton* (q. v.) in 1845, obtaining from it by dissolution in ether the material called Collodion (q. v.). In his later years, he confined himself chiefly to experiments with oxygen. Of his works, which generally first appeared in periodicals, the chief are—*Das Verhalten*

des Eisens zum Sauerstoff (Basel, 1837), *Beiträge zur physikalischen Chemie* (Basel, 1844), *Ueber die Erzeugung des Ozons* (Basel, 1844), *Ueber die langsame und rasche Verbrennung der Körper in atmosphärischer Luft* (1845). He died in 1868.

SCHÖNBRUNN, a royal palace in the outskirts of Vienna (q. v.), the summer residence of the imperial family.

SCHÖ'NEBECK, a manufacturing town of Prussia, ten miles south-east of Magdeburg, on the left bank of the Elbe. The chemical works, which give employment to about 400 men—the salt refineries, where the brine obtained from the abundant salt-springs is boiled down, and salt made to the annual value of 413,000 thalers—and the breweries and distilleries, are the principal industrial establishments. Pop. (1880) 12,333.

SCHOOLCRAFT, HENRY ROWE, American author, geologist, and ethnologist, was born at Watervleit (now Guilderland), New York, March 28, 1793. He entered Union College in his fifteenth year, and studied French, German, Hebrew, chemistry, and mineralogy. In 1817—1818, he visited the mining region west of the Mississippi, sent a collection of minerals and geological specimens to Washington, and wrote *A View of the Lead Mines of Missouri*, &c. (8vo, New York, 1819), and a narrative, since enlarged, entitled *Scenes and Adventures in the semi-alpine Region of the Ozark Mountains of Missouri and Arkansas* (8vo, Philadelphia, 1853). In 1820, he was appointed geologist of an exploring expedition to the Copper Regions of Lake Superior and the Upper Mississippi. He was afterwards secretary of a commission appointed to investigate Indian claims and negotiate treaties, at Chicago. As the result of these labors, he made a report to the government and wrote also *Travels in the Central Portion of the Mississippi Valley* (8vo, New York, 1825). In 1822, he was appointed Indian agent for the north-western frontier, and established himself at Sault Ste. Marie. In 1823, he married Miss Johnston, grand-daughter of an Indian chief, who had been educated in Europe. At this period, being in intimate relations with many Indian tribes, he devoted himself to the study of their history and ethnology.

From 1828 to 1832, he was an active member of the legislature of Michigan Territory, and founded its Historical Society, and the Algic Society of Detroit. For his Lectures on the Indian Languages, he received the gold medal of the French Institute. Adding poetry to science, he wrote: *The Rise of the West; Geehale, an Indian Lament; Indian Melodies; The Man of Bronze, or Portraitures of Indian Character; Iosco, or the Vale of Norma;* also a grammar of the Algonquin language. In 1832, he was appointed to the command of an expedition which discovered the sources of the Mississippi, the *Narrative* of which was published (8vo., New York, 1834). As superintendent and disbursing agent for the Indians, he negotiated treaties by which the government acquired lands to the extent of 16,000,000 acres. He visited Europe in 1842, and the following year he made a tour, chiefly for the observation of Indian antiquities, in Western Virginia, Ohio, and Canada. In 1845, he collected the statistics of the Six Nations, and published *Notes on the Iroquois*, &c. (8vo., Albany, 1848). In 1847, the United States Congress authorized his publication of *Historical and Statistical Information concerning the History, Condition, and Prospects of the Indian Tribes of the United States, in six volumes quarto, with* 336 *Plates by Major Eastman and others* (Philadelphia, 1851—1857). He also published *Algic researches; Thirty Years with the Indian Tribes of the North-western Frontier; The Indian in his Wigwam*, &c. In 1847, he was married, for the second time, to Miss Howard of South Carolina. He died in 1864.

SCHOOLMASTER, ARMY AND NAVY. In the Army, the schoolmaster is a non-commissioned officer of the first class, ranking next to a sergeant-major. His pay varies with length of service, rising gradually from 4*s*. a day on appointment, to 8*s*. a day after long service. He has an advantage over other non-commissioned officers in quarters and certain allowances. To become an army schoolmaster, it is necessary either to be a certificated schoolmaster, or to have served the apprenticeship as a pupil-teacher, and to pass through a course of training for one year at the Normal School in the Royal Military Asylum, Chelsea. After the completion of the training, the candidate is required to enlist as a common soldier for ten years' general service, whereupon he is immediately promoted to the rank of schoolmaster. A few of the most deserving schoolmasters are promoted to be sub-inspectors of schools, when they rank as lieutenants, and have 10*s*. a day for pay. The duties of the schoolmaster are to teach the soldiers and their children the rudiments of general knowledge, to examine the girls' school, and to deliver lectures to the soldiers. There were, in 1880, 176 army schoolmasters, besides 13 sub-inspectors.

In the Navy, the schoolmaster is a chief petty officer, whose duties are analogous to those of the army schoolmaster, except that he has no pupils younger than the ship's boys. Among the subjects he teaches are the taking of solar and lunar observations, and the elements of navigation. His pay ranges from 4*s*. to 6*s*. a day.

SCHOOLMISTRESS, ARMY, is a person attached to each regiment or corps for the purpose of instructing the daughters of soldiers and their sons, under eight years old in the rudiments of English and in plain needlework. She must be a certificated schoolmistress, or a pupil-teacher who has served her apprenticeship. After admission to the service, she is specially trained for six months at one of four training institutions. This training is at the expense of government. The salary of a schoolmistress varies from £30 a year in the third class to £50 a year in the first class. Proper provision is made for the quarters and supplies of the schoolmistress, whose somewhat anomalous position among rough men calls for the most circumspect behavior. The annual charge (1880—1881) for army schoolmistresses amounted, for 167, to the sum of £5450.

SCHOOLS, BROTHERS OF CHRISTIAN, a religious congregation in the Roman Catholic Church, established for the religious and secular education of the poor. It originated in France in the end of the 17th c., and was organized by a charitable ecclesiastic, the Abbé de la Salle, canon of the church of Rheims. The members are all lay brothers, and are subject to one general head. Houses of the order are found in almost every country of Europe. In France, this congregation was one of those which were specially excepted from among the suppressed orders, and which were re-established in France by General Bonaparte in the concordat of 1801. It continues to flourish in that country, as also in Belgium, Italy, Southern Germany, Great Britain, and North America. The brethren are bound by the ordinary religious vows of poverty, chastity, and obedience. Their system of education has received the highest testimonies, and they still form one of the most flourishing of all the lay orders in the Roman Church, numbering, it is said, nearly 3000 members. Besides this order, which is of French origin, similar institutes have been formed under the same or analogous names in other countries, the several varieties of which it would be tedious to enumerate.—SISTERS OF THE CHRISTIAN SCHOOLS. Several congregations of women for the education of poor female children also exist in the Roman Catholic Church. A long catalogue of these, with the history of their origin, and their specific constitution, will be found in Wetser's *Kirchen-Lexicon*, vol. ix. pp. 782—784.

SCHOOLS, PUBLIC AND GRAMMAR. Under their respective heads, GYMNASIUMS, EVENING SCHOOLS, REFORMATORY SCHOOLS, and INDUSTRIAL SCHOOLS, have been treated of at sufficient length for the purposes of an encyclopædia. The list of educational institutions would, however, be incomplete were nothing to be said regarding the Public and Grammar schools of England. By the term 'public schools' are generally designated the ancient foundations of Winchester, Eton, Harrow, Rugby, Westminster, Charter-house, Shrewsbury, St. Paul's School, and Merchant Taylors.' But there exist more modern seminaries, which have been instituted chiefly on the model of these, such as Marlborough College, Cheltenham College, and Wellington College. Endowed Grammar Schools of old foundation exist in almost all the principal towns of England, and are frequented both by day pupils and boarders from the country. As almost all the independent and endowed grammar schools of England are taught by men whose notions of school discipline have been formed at one or other of the great public schools, these may fairly be added to those already enumerated as in point of fact Public schools. The course of instruction pursued, the methods of teaching, and the habits of life and of discipline, will be found to be substantially similar in all endowed middle schools, whether called Public or Grammar schools. A great number of these schools derive not only the *fixed* emoluments of the masters from old bequests, but also the means of boarding and educating a certain number of boys on the foundation. It was originally for these foundationers or collegians that a large proportion of the old schools were founded; but round them has grown up a large community composed of pupils from all parts of the British dominions, tutors, and keepers of boarding-houses.

The foundationers consequently form simply the nucleus of these schools. The course of instruction is intended to prepare for the universities, and is consequently adapted to this purpose. Latin and Greek form the basis of the whole instruction; geography, ancient history, arithmetic, and mathematics being admitted to a very subordinate place in the curriculum. The school-time devoted to arithmetic and mathematics is now, however, considerably greater than was formerly given, and modern languages and the elements of science begin to receive a larger share of attention. There are, of course, tutors available at these educational seats for all usual branches of instruction, including music and drawing; but these subjects are alien to the proper work of the school, and do not affect the standing or promotion of the pupils. At Rugby, the school course includes *both* French and German, and natural science is admitted as an alternative study with these. In the more modern institutions, such as Marlborough, Cheltenham, and Wellington Colleges, attempts have been

made to provide a modern course of instruction, running parallel with the classical, for the benefit of those boys who either show an inaptitude for classical studies, or who are not destined for the universities. That a sound education may be obtained by means of science and modern languages cannot be doubted; but its value, as compared with classical discipline, even for those who do not contemplate a university course, or one of the learned professions, is still an open question. If, however, it be the case that there is a natural inaptitude in some boys for linguistic discipline, who *yet* possess capacity for scientific study or the acquisition of a modern language, we are driven to the conclusion, that such a course of study ought to be provided for this portion of the youth of Great Britain. Whether it ought to be provided at the existing grammar and public schools, is a subject at present keenly debated, but must be ultimately very much a question of finance.

In Germany, many of the gymnasiums provide a course of modern or *real* study, and this, combined with the wide diffusion of middle-schools, under the name of *Real-schulen*, meets all the reasonable wants of that portion of the middle class which does not contemplate a professional life. In France, the *Lycées* provide an ancient and modern course, running parallel with each other, for all pupils above a certain age. Up to that age, all are taught the same subjects. In Scotland, the number of middle schools in important towns, either established by private enterprise or by the town council or endowment, renders it unnecessary for boys to seek away from their homes the preparation necessary for either the Scottish universities or commercial life. The Scotch schools are elastic in their system, adapting themselves to the wants of parents, and all of them admit the modern element into their course of study; but the curriculum of study does not carry pupils so far as it ought, and the funds of the schools are wholly inadequate.

The 'Schools Inquiry Commission' reported on the grammar schools of England in 1868, and their Report led to the appointment of an endowed Schools Executive Commission for purposes of Reform. The Scotch Endowed Schools Commission reported to government in 1874–75.

SCHOOLS, REGIMENTAL, in the British army comprise the school for adults and boys above eight years of age, under the Schoolmaster (q. v.), and the infant and industrial schools under the Schoolmistress (q. v.), for girls and little boys. In the first, plain subjects are taught to soldiers who voluntarily attend, or to soldiers' children. The education is wholly secular: the only theological teaching being exposition of a portion of Scripture during the first half hour of morning school; but even at this, attendance is at the option of the parents. The infant school is conducted on similar principles. The industrial school is to fit girls for the occupations of life, and to render them capable of entering domestic service; a grant of money is made by government for the provision of materials. There is a school of each sort in every battalion of infantry or regiment of cavalry, the total cost of which amounts, for 1880, to £35,704. Adult soldiers are admitted gratuitously; for children, there is a nominal charge of 1*d*. each a month. The orphans of soldiers and the children of soldiers serving abroad are received at any neighboring school without payment; those of pensioners, contractors, &c. at 3*d*. a month; and the children of officers at 5*s*. a month. It is forbidden that any difference should be made in the schools, in the treatment of these different classes of pupils.

SCHOONER is a swift, sharply-built vessel, carrying usually two masts, though occasionally a greater number, and commonly

Topsail Schooner.

is of small size. There are two classes of schooners—the 'fore-and-aft schooner,' or schooner proper, and the 'topsail schooner.' In the former, both foremast and mainmast are rigged like the mainmast of a cutter, with four-and-aft sails. In the latter, the foremast carries a square topsail and a square topgallant-sail. Off a wind, the former rig has a great advantage, as the schooner can sail up within 4½ or even 4 points of the wind; but before the wind, the square topsail gives the advantage to the topsail schooner; and as the latter can on occasion strike her squaresails, and set a fore-and-aft topsail in their place, she has usually the preference. No sailing-vessel is faster than a schooner of fine build, when she

Fore-and-aft Rigged Schooner

carries ample canvas; hence it is a favorite form for the larger class of yachts; and before the introduction of steam dispatch-vessels, was employed much in the packet service. Schooners are still employed in the navy as revenue cruisers; and to a great extent in the merchant service, for running small cargoes, and especially those of perishable goods, as fish or fresh fruit. They are easily managed by a small crew; but from the sharpness of their build, have no great amount of stowage.

SCHOPENHAUER, ARTHUR, a German philosopher, son of Johanna Schopenhauer, an authoress of considerable distinction (born 1770, died 1838), was born at Danzig, 22d February 1788. He studied first at Göttingen, where the lectures of Schulze inspired him with a love of philosophy, and afterwards at Berlin and Jena, in the last of which places he graduated in 1813. During the same year, he published his first treatise, *Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde* (Rudolst. 1813, 2d ed. Frankf. 1847), in which he lays down the logical basis of his future system. S. spent the winter of 1813 at Weimar, where he enjoyed the society of Goethe, and the orientalist Friedr. Maier, who first turned his attention to the ancient Indian literature and philosophy, the study of which exercised a great influence on his future development. He then proceeded to Dresden, where he published a treatise on Sight and Color (*Ueber das Sehen und die Farben*, Leip. 1816), which was followed, three years later, by his great work, *Die Welt als Wille und Vorstellung* ('The World considered as Will and Idea, Leip. 1819; 2d ed. 1844). After 1820, S. lived partly in Italy and partly in Berlin, up till 1831, when he fixed himself in Frankfurt-on-the-Maine, devoting himself uninterruptedly to the elaboration of his system. The fruits of his studies were *Ueber den Willen in der Natur* (Frankf. 1836); *Ueber die Freiheit des Willens, Ueber das Fundament der Moral*, the supplements to his principal work, which appear in the 2d edition of 1844; and *Parerga und Paralipomena* (Berl. 1851). He died September 21, 1860. The fundamental doctrine of S. is, that the only essential reality in the universe is will; that what are called appearances exist only in our subjective representations, and are merely forms under which single original will shows itself.

This will is not necessarily accompanied by self-consciousness, though it ever strives after its attainment, and hence S. declared himself the uncompromising opponent of all the contemporary systems—those of Fichte, Schelling, and Hegel—in which the 'Absolute Reason,' 'Consciousness,' &c., are posited as the necessary basis of thought. For his great rivals, S. professed the most unmeasured scorn—calling Hegel, for example, a mere 'scribbler of nonsense'—and in return was treated by them with such sovereign contempt, that for years his name was almost unknown to the majority of German students. The ethics of S. are based on a thoroughly pessimistic theory of life. S. has of late had a great influence on philosophical speculation. The literature of the subject is boundless; some of the chief writers on S. being Frauenstädt, Cornill, Asher, Seydell, Haym, and Hartmann; in French, Ribot. See Miss Zimmern's *Life of S.* (1876).

SCHORL. See TOURMALINE.

SCHORL ROCK is a granitoid rock, in which the mica is replaced by schorl or tourmaline. Some specimens occur in which the felspar is also absent, and the mass is composed entirely of quartz and schorl. Schorl rocks are rare, occurring probably only as small bosses in granite.

SCHOTTI'SCHE (a Frenchified form of the German word for *Scottish*) a somewhat fanciful name given to a slow modern dance in $\frac{2}{4}$ time.

SCHOUW'EN, an insular portion of the province of Zeeland (q. v.). Pop. 20,000.

SCHREVELIUS, CORNELIUS, a Dutch scholar, was born at Haarlem in 1615. In 1642, he succeeded his father as rector of the university of Leyden, and died 11th September 1664. S. was a laborious and erudite man, but possessed little critical discernment. His most notable performance was a *Lexicon Manuale Græco-Latinum et Latiano-Græcum* (Leyden, 1654, 1657, 1664), of which there have been innumerable editions. S. also executed many *variorum* editions of the classics—Juvenal (1648), Hesiod (1650), Terence (1651), Virgil (1652), Horace (1653), Homer (1656), Martial (1656), Lucan (1658), Cicero (1661), Ovid (1662), and Claudian (1665).

SCHUBERT, FRANZ PETER, a German composer, was born in Vienna, Jan. 31, 1797. He began to compose about the age of twelve, and from that time onwards proceeded from his pen a series of works, increasing year by year in number and importance. His life was uneventful, but he underwent much suffering from poverty and want of recognition. For long after his death, which occurred Nov. 19, 1828, he was almost solely known by his songs, of which alone 457 are now published. But more recent years have brought to light a vast store of orchestral and chamber music, foremost among which stands his great symphony in C. His known works amount to over 1000. His music is distinguished above all by its overflowing wealth of expressive melody, control over its exuberance being perhaps his only want. His operatic works have probably owed their ill success mainly to the worthlessness of their *libretti*. His characteristics may be summed up in Liszt's words, 'the most poetical musician that ever was.'

SCHUMANN, ROBERT ALEXANDER, a German composer, was born at Zwickau, in Saxony, June 8, 1810. His gift for music showed itself early. After passing more than two years, in obedience to his mother's wish, in the study of law at the university of Heidelberg, he was at length permitted to devote himself to music. His ambition at first was to excel as a pianist, but owing to the disablement of one of his fingers, he was compelled to relinquish this aim. His efforts were then directed for a while almost exclusively to the composition of pianoforte music, in which he originated a completely new style, reflecting his own dreamy imaginative nature, often exhibiting genuine humor, and always thoroughly solid. About the time of his marriage, in 1840, to Clara Wieck, one of the greatest living pianists, he produced a series of songs, remarkable for their profound suggestiveness, which have taken a lasting hold on the kindred minds of his countrymen. His piano concerto, and five symphonies, productions of later life, are generally considered the finest of their class since Beethoven's. He has also produced some choral works of the highest class, notably the cantata, *Paradise and the Peri*, and settings of parts of Goethe's *Faust* and Byron's *Manfred*. Among his chamber music his piano quintet claims the highest rank. From 1834 to 1844, S. was editor of the famous *Neue Zeitschrift für Musik*, originated principally by himself; and his critical contributions have a foremost place in the literature of art. S. died at Endenich, near Bonn, July 29, 1856. Since then his name has been the watchword of the *Romantic* school of music, in opposition to the *Ideal*, represented by Mendelsshon; but during their lives these composers stood on terms of the warmest mutual esteem, and there seems no reason why the two schools should not co-exist in the same amicable relations.

SCHUY'LKILL, a river of Pennsylvania, U. S., which rises in the carboniferous highlands of the eastern center of the state, and flowing 120 miles south-east, empties into the river Delaware 5 miles below Philadelphia.

SCHWANTHALER, LUDWIG MICHAEL, a celebrated German sculptor, was born in 1802 at Munich, where his father, Franz Schwanthaler, practised the same art. Young S. entered his father's workshop at the age of 16; and on the death of the latter in 1821, he undertook to carry on his father's business. His first important commissions were received in 1824 from King Maximilian. After a brief residence in Rome, he set up a studio of his own at Munich, and shortly after executed for the *Glyptothek* there two fine bas-reliefs from Homer: 'Achilles struggling in the Scamander,' and the 'Battle by the Ships,' besides a statue of Shakspeare for the saloon of the theater, and the Bacchus-frieze for the Banqueting-hall in the Palace of Duke Maximilian. In 1832, he revisited Rome, for the purpose of preparing models for that portion of the national monument of Valhalla intrusted to his supervision. He remained two years. On his return to Munich, he began his bas-reliefs to illustrate Pindar's *Epinikia* (Triumphal Odes) and the myth of Aphrodite, the latter of which is a frieze. In 1835, he was appointed professor at the Munich Academy. Henceforth, the interest of his career is mainly professional; but the number of his works is singularly great, while their excellence is such as to place him in the first rank of German sculptors. His distinguishing characteristics are a thorough originality of design, and boldness of imagination; while the extraordinary extent of his acquaintance with the sculpture of Greece and of the Middle Ages gave a great richness and variety to his execution of details. Among his works may be mentioned 24 statuettes in the *Pinakothek* at Munich; the great bas-relief frieze (in the Barbarossa Hall), more than 200 feet long; the models for the 12 statues of the ancestors of the House of Wittelsbach, the 15 colossal statues for the front pediment of the Valhalla, the models of the 15 statues of the 'Battle of Arminius' for the northern end of the same structure, and the model of the colossal statue of Bavaria, 54 feet high; a marble statue of the Emperor Rudolf for the cathedral of Spires, models for the statues of Goethe and Jean-Paul Richter, a statue of Mozart, marble groups of Ceres and Proserpina (at Berlin), &c., besides numerous other works executed by his pupils from his designs. He died in 1848.

SCHWARZ, CHRISTIAN FRIEDRICH, a distinguished German missionary, was born at Sonnenburg, in Brandenburg, October 26, 1726. He studied at Halle, and having resolved to become a missionary in the East Indies, obtained ordination at Copenhagen, with the view of joining the Danish mission at Tranquebar, where he arrived in 1750. His career is a beautiful example of what may be accomplished when piety, integrity, good sense, and a charity that knows how to prevent the virtue of zeal from lapsing into the vice of fanaticism, unite harmoniously in a man. After laboring 15 years at Tranquebar, he went to Trichinopoly, where he founded a church and school, and also acted as chaplain to the garrison. Here the fruits of his long and consistent career of pious activity gradually began to show themselves in considerable conversions from Hinduism. In 1777, another missionary was sent to his assistance; and by the permission of the Rajah of Tanjore, whose friendship he had acquired, he built a church in that city. So highly did the native rulers admire his integrity, that once, when Hyder Ali, of Mysore, was arranging terms of peace with the Madras government, he demanded that S. should act as their agent—'him, and no other one,' said the Sultan, 'will I receive and trust.' On this occasion, S. resided three months at Seringapatam. During the terrible Carnatic war which soon after followed (1781—1783), and for which S. thought the British were to blame, a striking testimony was given of that universal respect entertained for his character. The inhabitants and garrison of Tanjore were dying of starvation, and neither the British nor the Rajah could induce the cultivators to sell them provisions. In despair, S. was appealed to, and when he gave his word that payment should be made, the farmers believed him, and sent the requisite supplies. On the death of the Rajah of Tanjore, in 1787, S. was appointed tutor and guardian of his young son, Maha Sarboji, who turned out, under S.'s care, one of the most accomplished sovereigns in or out of India. S. died February 13, 1798.

SCHWARZBURG, HOUSE OF, one of the oldest German families, founded about the middle of the 12th c., by Sizzo, Count of Schwarzburg and Käsernburg. The two sons of Sizzo were Heinrich, who succeeded his father as Count of Schwarzburg, and Günther, who became Count of Käsernburg. The former, dying childless in 1184, his possessions went to his brother, who left two sons, Günther, who continued the family of the Counts of Käsernburg, and Heinrich, from whom sprung the Counts of Schwarzburg. In 1349, Günther XXI., the younger son of Heinrich XII., was elected Emperor of Germany, but he died within the year of his election. Count Günther XL. of Schwarzburg and Arnstadt, who introduced (1541) the reformation into his states, was the common ancestor of the two existing lines of the Schwarzburg family; his son, Johann Günther, founding the line of Schwarzburg-Sondershausen (q. v.), and Albert, that of Schwarzburg-Rudolstadt (q. v.).

SCHWA'RZBURG-RU'DOLSTADT, a German principality, bounded on the E. by Weimar, Altenburg, and Meiningen, with a detached part, 30 miles to the north, in Prussian Saxony. Area, 367 sq. m.; pop. (1880) 80,296, of whom above 76,000 were Lutherans. It consists of the Upper Lordship (*Rudolstadt*, 282 sq. m.) and the Lower Lordship (*Frankenhausen*, 85 sq. m.). The Schwarza, Ilm, and Saale water the surface, which is for the most part covered with spurs of the Thuringer-wald. The ordinary crops are raised, and timber, salt, and metals are the principal products. The principality contains many spots distinguished for beautiful scenery; and besides the vale of the Schwarza, the convent-ruins of Paulenzelle, and the remains of the castle of Kyffhausen, attract many visitors. S. has a diet of 16 members, of whom 12 are chosen by general election. S. has one vote in the federal council, and one in the diet.

SCHWA'RZBURG-SO'NDERSHAUSEN, a German principality, is partly surrounded by Prussian Saxony. Area, 333 sq. m.; pop. (1880) 71,107, mostly Protestants. It consists of a

Lower Lordship (*Sondershausen*) and an Upper Lordship (*Arnstadt*). The former of these, watered by the Helbe and Wipper, is fertile and agricultural; while the latter is mountainous, and is the seat of active manufactures. The diet contains 5 members nominated by the prince, 5 chosen by the most heavily taxed, and 5 by general election. S.-S. has one voice in the federal council, and sends one representative to the imperial diet.

SCHWARZENBERG, a princely family of Germany, dates from 1420, when *Erkinger von Seinsheim* purchased the lordship of S. in Franconia, and was raised (1429) by the Emperor Sigismund to the dignity of Baron of the Empire. Two of this family have acquired a European reputation: the first, ADAM, Count of S., who was born in 1587, and became prime-minister and adviser of Georg-Wilhelm, Elector of Brandenburg. He was all-powerful during the Thirty Years' War, and brought down terrible calamities on Brandenburg by his obstinate adherence to the Alliance with Austria against the Protestant league, for which he was punished after the accession of the 'Great Elector,' in 1640, by being despoiled of his power, and imprisoned in the fortress of Spandau, where he died 17th March, 1641. The other, KARL PHILIPP, Prince of S., was born at Vienna, 15th April, 1771, first served against the Turks, and had risen to the grade of lieutenant field-marshal in 1799, at which date he raised a regiment of Hulans at his own cost. He was under the orders of Mack in the campaign of 1805, and commanded a division at Ulm; but when he saw that the battle was lost, he cut his way through the French army, and retired with his regiments to Eger, afterwards taking part in the great battle of Austerlitz. He was ambassador at the Russian court in 1808, by the express wish of the Emperor Alexander; fought at Wagram in 1809; and after the treaty of Vienna, conducted the negotiations preliminary to the matrimonial connection of Napoleon with the Hapsburg family; and both in this capacity and as ambassador at Paris, so gained the esteem of Napoleon, that the latter expressly demanded for him the post of general-in-chief of the Austrian contingent of 30,000 men which had been sent to aid France against Russia in 1812.

S. with his little army entered Russia from Galicia, passed the Bug, and achieved some slight successes, but was afterwards driven into the 'duchy of Warsaw' (see POLAND), and took up a position at Pultusk, where he concluded with the Russians an armistice which secured the French retreat. S. was much blamed for his dilatory conduct at the time; and his tardiness, ascribed by the French historians to secret instructions from his own government, has since been much animadverted upon by them; but nevertheless Napoleon concealed any dissatisfaction he might have felt, and demanded (1813) for him from the Austrian government the baton of field-marshal. After a brief sojourn at Paris S. was appointed to the command of the Austrian army of observation in Bohemia; and when Austria joined the allied powers, he became generalissimo of the armies of the coalition; gained the victory of Leipzig (q. v.), and introduced a cautious system of tactics, which insured a progressive hemming-in of the French, and in spite of their occasional successes, completely wore them out. On the return of Napoleon from Elba, he obtained the command of the allied army on the Upper Rhine, and a second time entered France. On his return to Vienna, he was made president of the imperial council for war, received an extensive grant of lands in Hungary, and was allowed to engrave the imperial arms of Austria on his escutcheon. He died of apoplexy at Leipzig, 15th October 1820.—His nephew, FELIX LUDWIG JOHANN FRIEDRICH, born October 2, 1800, distinguished himself in the Italian campaign of 1848, was placed at the head of affairs at Vienna, called in the aid of the Russians against Hungary, and pursued a bold policy in Germany. He died at Vienna, April 5, 1852.

SCHWEDT, a handsome town of Prussia, in the province of Brandenburg, on the Oder, 31 miles south-south-west of Stettin. Weaving, brewing, the manufacture of soap and of tobacco, which is here extensively grown and sold, are the principal branches of industry. Pop. (1880) 9899.

SCHWEI'DNITZ, a charmingly situated town of Prussian Silesia, on the left bank of the Weistritz, 42 miles south-east of Liegnitz, and about the same distance south-west of Breslau by railway. Woollen goods, leather, and agricultural implements are manufactured; and the fairs for corn, cattle, and yarn are much frequented. S. was besieged and taken four times within 50 years, the last time by the French in 1807, when the defences were in great part destroyed. Pop. (1880) 22,202.

SCHWEI'NFURT, an ancient, and long an imperial free city, the *Trajectus Suevorum* of the Romans, now a town of Bavaria, in Lower Franconia, on the Main, 29 miles north-east of Wurzburg by railway. It contains a beautiful market-place, in which important cattle and wool markets are held. Wine-culture, sugar-refining, and manufactures of chemicals and dyeing materials, as white-lead, ultramarine, Schweinfurt green, &c., are carried on. See GREEN. Pop. (1880) 12,601.

SCHWEINFURTH, GEORG AUGUST, a distinguished African traveler, was born in Riga, 29th September, 1836. He studied at Heidelberg, Munich, and Berlin, making botany his specialty. In 1864 he made a journey through the valley of the Nile and along the coasts of the Red Sea, and on his return to Berlin in 1866, had the botanical, zoological, and geological fruits of his travels classified. In 1868, by the aid of a grant from the Royal Academy of Sciences of Berlin, he again started for Africa, and made his way from Khartoum into the interior, in the company of the ivory-traders, along the valley of the White Nile. Between the 4th and 6th parallels of north latitude, he penetrated as far westward as the 26th meridian, carefully noting the nature of the countries through which he passed, and the character of their various tribes. He returned in 1872; and in 1874 published the results of his travels under the title of *Im Herzen von Afrika* 2 vols. An English translation, *The Heart of Africa*, was published the same year. S. was made president of the Egyptian Geographical Society in 1875.

SCHWE'RIN, capital of the grand duchy of Mecklenburg-Schwerin, is agreeably situated on the west shore of the Schweriner See, a lake 14 miles in length, and 3 miles broad, and abounding in fish. S. is divided into the old town, the new town, and the suburb, is well built, and contains one of the finest Gothic cathedrals in Northern Germany, begun in 1248, and finished in the 15th c. The ducal castle, erected by Wallenstein, stands on a small island. In S. there are tobacco-factories, an iron-foundry, breweries, &c. Pop. (1880) 30,146.

SCHWYZ, one of the mountain cantons in the middle of Switzerland, is bounded on the N. by the canton of St. Gall, and the canton and Lake of Zürich, and on the S. by the canton of Uri and the Lake of Lucerne. Area, 350 sq. m.; pop. (July 1880) 51,235, of whom only 800 are Protestants. The whole surface is covered with mountains, except small tracts in the south-west and north-east; but there are no glaciers nor any everlasting snow except on the Rieselstock, 8890 feet high, on the east frontier. The canton comprises a third part of Lake Zug, the most northern angle of the Lake of the Four Cantons, the whole of the mountain-mass of the Righi (q. v.), the plain in which lies the small Lake Lowerz, and the valleys of the Muotta, Sihl, and Aa, the principal rivers. Cattle-breeding is the employment of almost the whole of the inhabitants, and the number of cattle is estimated at about 20,000. Only about one-thirtieth of the whole area is cultivable; fruits and wine are cultivated to some extent; and cattle, cheese, and timber are exported. Woven fabrics for home use are almost the only manufactures.

S., one of the three original cantons, and also one of the Four Forest Cantons, has supplied the name to the whole country of which it forms a part. The government is a representative democracy.—SCHWYZ, the capital, is a small town, containing a beautiful parish church, and most picturesquely situated 17 miles east of Lucerne.

SCIA'CCA (anc. *Thermæ Seluntinæ*), a seaport of Sicily, in the province, and thirty miles west-north-west of the city of Girgenti. It is defended by the castle of Luna, is surrounded by old walls, and has a fine cathedral. Outside the walls are the hot springs, which are visited by invalids, and upon a neighboring height, the so-called *Stufe di St. Calogero*. At the bottom of one of the wells a noise is heard resembling that of a cascade. Pop. (1881) 19,965. S. was the birthplace of Agathocles, tyrant of Syracuse, and of Fazelli the historian.

SCIÆ'NIDÆ, a family of acanthopterous fishes, somewhat resembling perches; having a compressed body; a simple or double dorsal fin, the first part spiny; the gill-covers variously armed; the head generally inflated, and its bones cavernous; the scales are ctenoid, and in general obliquely ranged. The S. are divided into many genera, and widely distributed. Most of them are marine, but a few inhabit fresh water. Only two species are reckoned as British, the Maigre (q. v.) and the Bearded Umbrina (q. v.), both excellent for the table. The power of emitting sounds which belongs to the maigre is possessed also by others of the family in a remarkable degree. Among these are species of *Pogonias*, as *P. chromis*, known by the name DRUM-FISH, because the sound which it emits resembles that of a drum.

SCIA'TICA is the term given to neuralgia of the great sciatic nerve. See NERVOUS SYSTEM. It has been shown by Graves to be a frequent complication of gout; but rheumatism, or exposure to cold and wet, is its most common cause. It is characterized by irregular pains about the hip, especially between the great trochanter of the thigh-bone and the bony process on which the body rests when sitting, spreading into neighboring parts, and running down the back of the thigh to the leg and foot; or the pains may occupy only isolated parts, as the knee-joint, the calf of the leg, or the sole of the foot. S. is a very obstinate disease, but the

treatment is the same as that of neuralgia generally, except when it is merely a complication of gout, in which case the primary disease must be attacked as well.

SCIATIC STAY (possibly a corruption of *Asiatic*), in merchant-vessels, is a strong rope fastened between the main and foremast heads. When loading or unloading, a traveling tackle is suspended to it, which can be brought over the fore or main-hatchway as occasion demands.

SCI'CLI, a town of Sicily, in the province of Syracuse, on the small river Scicli, 21 miles west-south-west from Noto. The woollen manufacture is carried on. S. is supposed to be the ancient *Casmenæ*. Pop. 10,029.

SCIENCES, the name for such portions of human knowledge as have been more or less generalized, systematized, and verified. Generality as opposed to mere particulars, system as opposed to random arrangement, and verification as opposed to looseness of assumption, concur in that superior kind of knowledge dignified by the title in question. Geography, Chemistry, and Political Economy are now sciences. The first has been so for many ages, although greatly advanced in recent times; the two last, scarcely more than a century. Chemical facts and maxims of political economy had been known from a much earlier date, but they did not in either case amount to science; the generalities were few or bad, system and certainty were both wanting. In the different branches of Natural History—Mineralogy, Botany, Zoology—there had been a large store of accumulated facts before any one branch could be called a science. The *quality* of the knowledge is of more consequence than the quantity.

The term *Philosophy* (q. v.) is to a certain extent, but not altogether, coincident with science, being applied to the early efforts and strainings after the explanation of the universe, that preceded exact science in any department. Both names denote the pursuit of knowledge as knowledge, or for intellectual satisfaction, in contrast to the search that is limited to immediate practice or utility.

The sciences have been variously classified, and the principles of their classification have been a subject of discussion. We shall here describe the mode of classifying them in accordance with present usage, and with the principles most generally agreed upon.

It is convenient to prepare the way by distinguishing between Theoretical Sciences, which are the sciences properly so called, and Practical Sciences. A Theoretical Science embraces a distinct department of nature, and is so arranged as to give, in the most compact form, the entire body of ascertained (scientific) knowledge in that department: such are Mathematics, Chemistry, Physiology, Zoology. A practical Science is the application of scientifically obtained facts and laws in one or more departments to some practical *end*, which end rules the selection and arrangement of the whole; as, for example, Navigation, Engineering, Mining, Medicine. Navigation selects from the Theoretical Sciences—Mathematics, Astronomy, Optics, Meteorology, &c.—whatever is available for guiding a ship on the seas, and converts the knowledge into rules or prescriptions for that purpose. The arts that can thus draw upon the exact sciences are by so much the more certain in their operation; they are the scientific arts.

Another distinction must be made before laying down the systematic order of the Theoretical Sciences. A certain number of these sciences have for their subject-matter each a separate department of natural forces or powers; thus, Biology deals with the department of Organized Beings, Psychology with Mind. Others deal with the application of powers elsewhere recognized to some region of concrete facts or phenomena. Thus, Geology does not discuss any natural powers not found in other sciences, but seeks to apply the laws of Physics, Chemistry, and Biology to account for the appearances of the earth's crust. The sciences that embrace peculiar natural powers are called Abstract, General, or Fundamental Sciences; those that apply the powers treated of under these to regions of concrete phenomena are called Concrete, Derived, or Applied Sciences.

The Abstract or Theoretical Sciences, as most commonly recognized, are these six: Mathematics, Physics, Chemistry, Biology (Vegetable and Animal Physiology), Psychology (mind), Sociology (society). The Concrete Sciences are the Natural History Group—Meteorology, Mineralogy, Botany, Zoology, Geology, also Geography, and we might, with some explanations, add Astronomy. The Abstract or Fundamental Sciences have a definite sequence, determining the proper order for the learner, and also the order of their arriving at perfection. We proceed from the simple to the complex, from the independent to the dependent. Thus, MATHEMATICS relates to *Quantity*, the most pervading, simple, fundamental, and independent attribute of the universe. The consideration of this attribute has therefore a natural priority; its laws underlie all other laws. As Mathematics is at present understood, it has an Abstract department which treats of quantity in its most general form, or as applied to nothing in particular—including Arithmetic, Algebra, and the Calculus—and a Concrete or Applied department—viz., *Geometry*, or Quantity in Space or Extension. It has been suggested that General Mechanics, or the estimation of Quantity in *Force* should be considered a second Concrete department. But usually Mechanics ranks with the next Fundamental Science in order, called Physics.

NATURAL PHILOSOPHY has long been considered the name of a distinct department of science: the designation PHYSICS is now more common. This science succeeds Mathematics, and precedes Chemistry. Of all the fundamental sciences, it has the least unity, being an aggregate of subjects with more or less connection. Mechanics, Hydrostatics, Hydraulics, Pneumatics, Acoustics, Astronomy, are all closely related; they represent the phenomenon of movement in *mass*, as applied to all the three states of matter, Solid, Liquid, and Gas. The remaining subjects—Heat, Light, and Electricity—together with the attractions and repulsions that determine Cohesion, Crystallization, &c., are described as relating to movement in the *molecule*. We have thus Molar Physics and Molecular Physics; and the tendency is now to treat the two separately.

CHEMISTRY lies between Physics and Biology, reposing upon the one, and supporting the other. It assumes all the physical laws, both molar and molecular, as known, and proceeds to consider the special phenomenon of the composition and decomposition of bodies considered as taking place in definite proportions, and leading to change of properties. The composition of a cup of tea from water, sugar, milk, and infusion of tea-leaf, is physical; the composition of marble from oxygen, carbon, and calcium, is chemical. In the one case, the properties of the separate ingredients are still discernible: in the other, these are merged and untraceable.

BIOLOGY, or the science of living organization, involves mathematical, physical and chemical laws, in company with certain others, called vital. It is most usually expounded under the designations Vegetable and Animal Physiology; and in the Concrete departments, Botany, Zoology, and Anthropology.

PSYCHOLOGY, or the Science of MIND, makes a wide transition, the widest that can be taken within the whole circle of the sciences, from the so-called material world, to the world of Feeling, Volition, and Intellect. The main source of our knowledge of mind is self-consciousness; and it is only from the intimate connection of mind with a living organism, that the subject is a proper sequel to Biology. Not until lately has any insight into mind been obtained through the consideration of the physical organ—the brain; so that Psychology might have been placed anywhere, but for another consideration that helps to determine the order of the sciences—viz., that the *discipline*, or method, of the simpler sciences is a preparation for the more abstruse. Mathematics and Physics especially are an admirable training of the intellect for the studies connected with mind proper, although the laws of Physics may not of themselves throw any direct light on the successions of thought and feeling.

These five sciences embrace all the fundamental laws of the world, and, if perfect, their application would suffice to account for the whole course of nature. To a person fully versed in them, no phenomenon of the explained universe can appear strange; the Concrete sciences and the Practical sciences contain nothing fundamentally new. They constitute a liberal scientific education. It is not uncommon, however, to rank SOCIOLOGY, or the Laws of Man in Society, as a sixth primary science following on Psychology, of which it is a special development.

Dr. Neil Arnott, in his work on *Physics*, first published in 1828, gave as the primary departments of Nature—Physics, Chemistry, Life, and Mind (under which he would include the Laws of Society). He did not discard Mathematics, but looked upon it as a system of technical mensuration, created by the mind to facilitate the study of the other sciences, as well as the useful arts. The natural laws expressed by Mathematics are few and simple, and the body of the science consists of a vast scheme of numerical computation, whose value appears in its applications to Astronomy and the other physical sciences.

Auguste Comte, who, in his *Cours de Philosophie Positive*, went over the entire circle of the Theoretical, Abstract, or Fundamental sciences, enumerated these as follows: Mathematics, Astronomy, Physics, Chemistry, Biology, Sociology. He thus detaches Astronomy from Physics, considering it as the abstract science that brings forward and works out the Law of Gravitation. He has no distinct science of Psychology, an omission that has been generally condemned. See POSITIVISM.

Mr. Herbert Spencer, in a tract on the *Classification of the Sciences*, takes exception to the scheme of Comte, and proposes a threefold division, according to the gradations of Concreteness in the subject-matter. The first group is termed ABSTRACT SCIENCE, and treats of the *forms* of phenomena detached from their embodiments. The most comprehensive forms are Space and Time; and the sciences corresponding are Mathematics and Logic.

The second group is ABSTRACT-CONCRETE SCIENCE, or the phenomena of nature analyzed into their separate elements—Gravity in the abstract, Heat in the abstract—as in Physics and Chemistry. These are two of the fundamental sciences in every scheme, and they are called Abstract-Concrete by Mr. Spencer, in comparison with the foregoing class. The great principle, of recent introduction, termed the Law of Correlation, Conservation, or Persistence of Force, serves to connect Physics with Chemistry, and imparts to the two taken jointly a greater unity than belongs to Physics singly. The third and last group is CONCRETE SCIENCE, or natural phenomena in their totalities, or as united in actual things—Astronomy, Biology, Psychology, Sociology, Geology, &c. Mr. John Stuart Mill, in an article in the *Wesminster Review*, April 1865, has described Comte's scheme at length, and also criticised that of Spencer. See SPENCER.

It may be held as generally admitted that Mathematics, Physics, Chemistry, Biology, and Psychology, with or without Sociology, are the sequence of the primary or fundamental sciences, and that the Natural History group, from not containing any new laws of nature, are not fundamental. Astronomy, or the laws of the solar system, and of the other celestial bodies, might be called a Natural History or Concrete science, if we supposed a prior abstract science that discussed the operation of gravity, together with the laws of motion in bodies generally, or without special application to the existing solar and sidereal systems. The first book of Newton's *Principia* would be the Abstract, the third book the Concrete, form of the science.

The Practical Sciences do not admit of any regular classification. They are as numerous as the separate ends of human life that can receive aid from science, or from knowledge scientifically constituted. Connected with Mind and Society, we have Ethics, Logic, Rhetoric, Grammar, Philology, Education, Law, Jurisprudence, Politics, Political Economy, &c. In the manual and mechanical arts, there are Navigation, Practical Mechanics, Engineering Civil and Military, Mining and Metallurgy, Chemistry applied to Dyeing, Bleaching, &c.

The medical department contains Medicine, Surgery, Midwifery, Materia Medica, Medical Jurisprudence. A science of Living, or of the production of Happiness by a skilled application of all existing resources, was greatly desiderated by Plato, and would be the crowning practical science.

SCI'LLA. See SQUILL.

SCI'LLY ISLANDS. These islands, situated a little west of 6° W. long. and about 50° N. lat., are the most southern parts of the United Kingdom of Great Britain, if we except the Channel Islands. The group consists of about 40, comprising a circuit of about 30 miles; and their general denomination is derived from a

Scilly Islands.

very small island, about an acre in extent, and almost inaccessible, called Scilly, probably from its position near dangerous rocks, similar to that of Scylla near Sicily. By the ancients, these islands, it has been commonly understood, were named Cassiterides, Hesperides, and Siluræ Insulæ. Some authorities have assumed that the term Cassiterides, or 'Tin Islands,' under which they were known to the Greeks and Romans, was once applied to the peninsula of Cornwall. Elton, in his *Origins of English History*, affirms, however, that the Cassiterides were the headlands of Galicia, or the islands off that part of the Spanish coast, and not the Scilly Islands at all.

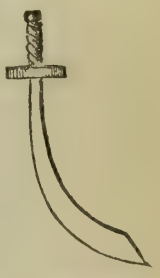
Numerous remains may be seen of rude pillars, circles of stones, kistvaens, rock-basins, and cromlechs. The granite of which the islands are composed is, in general, of a rather coarse quality, and from its color, iron seems to be frequently associated with it. There are metalliferous veins, or lodes, in some of the rocks, but none that could have yielded any considerable quantity of ore. The S. I. were in 936 granted by Athelstane to some monks who settled at Tresco. They were afterwards granted to the Abbey of Tavistock by Henry I., and were conferred by Queen Elizabeth on the Godolphin family. They are now the property of the crown.

Only five of the islands are inhabited. St. Mary's, the largest, comprises 1528 acres; Trescoe, 697; St. Martin's, 515; St. Agnes (a light-house station), 313; Sampson and Bryher, 269. The inhabitants are chiefly engaged in agriculture. Barley, oats, and a little wheat are grown. Large quantities of potatoes are sent to London and Bristol. Fishing, though not to any great extent, occupies some portion of the population. The climate is mild. The soil is in general sandy, but in Trescoe and St. Agnes it is remarkably fertile. The cliffs abound with sea-fowl, and are covered with samphire.

St. Mary's had, in 1871, a population of 1383, while the other four inhabited islands (Trescoe, St. Martin's, St. Agnes, Bryher) were collectively inhabited by only 707 persons; the total population in 1881 was 3315. Hugh Town is the capital, and contains an odd mixture of old-fashioned and neat modern houses. The pier, built in 1750 by Lord Godolphin, has been much improved by Mr. Smith, the present lessee of the islands. The custom-house and post-office are in the center of the town. Some remains of the old church are still seen in the fields, on the southern side of the island. The modern church, at the east end of the main street, is seated on rising ground, and forms a conspicuous object in the panoroma of the islands.

At Trescoe are the remains of an abbey founded in the 10th century. Among the objects of curiosity on this island are the ruins of Oliver Cromwell's camp, castle, and battery, built by the Parliamentarians under Blake and Ayscough. At Dolphin Down may be seen traces of ancient mining.

St. Agnes is about three miles south-west from St. Mary's. It is well cultivated, and is surrounded by some fine rock-scenery. The principal attraction is the light-house, 78 feet high, containing a revolving light, seen at a distance of 18 miles.



Scimitar.

SCI'MITAR, a description of sword used among eastern nations. It is considerably curved, and has its edge on the convex side. Being usually of high temper, and its shape favorable to incision, it forms an admirable cutting instrument, but is powerless as a thrusting weapon. The scimitar is not, however, any match for the bayonet.

SCINK, or SKINK (*Scincus officinalis*), a saurian reptile, found in the north of Africa, and in some parts of Asia. It is from six to eight inches long, generally of a reddish-dun color, with darker transverse bands, a wedge-shaped head, and four pretty strong limbs. It has been in great repute for imaginary medicinal virtues from remote times; it was largely imported on this account into ancient Rome, and is still in high esteem in the East, dried scinks finding a ready sale in many places, as Cairo and Alexandria. There is almost no disease for which it has not been supposed to be a cure.—The S. belongs to the family *Scincidæ*, which is interesting as one of the connecting links between saurians and serpents. The S. itself is in general appearance quite lizard-like; but in some of the allied genera, the limbs become rudimentary, or nearly so. In some, one of the pairs is wanting; and even the Slow-worms (*Anguis*) are by many naturalists reckoned in this family, in which the limbs are not manifest externally, although

Scink (*Scincus officinalis*).

they may be observed on careful dissection. Among the genera in which the four limbs are all externally manifest, although very small and imperfect, is *Seps*, sometimes made the type of a separate family, *Sepsidæ*, in which the body is much elongated and snake-like.

SCINTILLA'TION (Lat. *scintilla*), a term applied to denote the sparkling or flickering of the stars. The phenomenon is not yet quite explained, but that it is certainly due to the earth's atmosphere is proved by the following facts, which embrace nearly all that is known on the subject. If, on a clear evening, we look at

a bright star, such as Sirius, we observe that the intensity and color of its light are constantly changing—from great brilliancy to almost total obscurity, from bright red to fine blue, and so on. As it rises above the horizon, these appearances diminish in intensity; and stars near the zenith scarcely scintillate at all. Again, the amount of the scintillation depends upon the character of the weather—on some evenings, all large stars appear to scintillate strongly; on others, there is barely a trace of the appearance. It is commonly said that a planet can be distinguished from a star by the absence of scintillation. This is nearly, but not quite, true; for feeble scintillations have been occasionally observed in Mars and Venus, but very rarely in Jupiter and Saturn. One of the reasons of the non-scintillation of planets seems to be their finite apparent size; for all the more conspicuous planets show a sensible disc even in a poor telescope, while no instrument that has ever been constructed has shown a real disc in a star. Thus, a single particle or vesicle of vapor may be large enough to conceal a star for an instant, while it could have no such effect on a planet. It is pretty certain that scintillation is not due to unequally heated masses of air, since it usually modifies only the *appearance*, not the *position*, of a star. Another cause is easily seen in the comparatively feeble light of the planets. It is well ascertained that the scintillation is much less when viewed from the top of a mountain.—For a good idea of what is known, and what we desire still to know, on this subject, see a paper by Professor Dufour, *Philosophical Magazine*, 1860.

SCI'O, one of the most beautiful islands in the Ægean Sea, belongs to Turkey, and lies seven miles off the coast of Asia Minor, at the entrance to the Gulf of Smyrna. It is 32 miles long, and 18 miles in greatest breadth. Area, 400 sq. m.; pop. about 60,000. It is mountainous in the north, and is extremely fertile. Silk, figs, cheese, wool, and gum-mastic are its principal products; and its wine, which was famous in ancient times, is still esteemed. Kastro, the capital, a thriving and handsome town of 18,800 inhabitants, stands on the east coast, has a harbor, a castle, and two lighthouses, and carries on a growing trade in fruits, confectionery, and silk and woollen goods.

In early times, S. formed one of the 12 Ionian states, and it contributed 100 ships to the Greek force that fought and was defeated by the Persians in the sea-fight off Miletus (494 B.C.). In more recent times, the island was taken by the Genoese in 1346, and in 1566 by the Turks, in whose hands it has since, except for a short interval, remained. It was conferred as private property upon the sultana, enjoyed her protection, and consequently prospered. After it had enjoyed a long period of ease and wealth, a dreadful calamity befell the island at the outbreak of the Greek insurrection. A number of the Sciotes having, in 1822, joined the Samians, who had revolted, the island was attacked by a Turkish fleet and army, and the inhabitants, enervated by peace and wealth, were indiscriminately massacred; 25,000 fell by the sword, 45,000 were sold as slaves, and 15,000 escaped from the island. Gradually the island has recovered the blow it sustained. Repeated shocks of earthquake devastated it in April 1881; hardly a house was left standing; about 8000 of the inhabitants were killed, and several thousands were wounded.

SCIO'GRAPHY, the drawing of Sections (q. v.) of buildings, so as to show the interior of them.

SCIOPPIUS (Latinized form of *Schoppe*), KASPAR, a noted classical scholar and controversialist, was born at Neumark, in the Palatinate, 27th May 1576; studied at Heidelberg, Altdorf, and Ingolstadt; and in 1597, visited Italy, Bohemia, Poland, and Holland. Already he had become celebrated by his Latin verse and his notes upon different Latin authors. Next year, he abjured Protestantism, and became a Roman Catholic, in consequence of which he was decorated by the pope with various titles, and received a pension of 600 florins, together with a residence in the Vatican. Henceforth, his career is a series of fierce onslaughts chiefly on his former co-religionists, but also directed against all whom accident or malice led him to hate. The first person whom he selected for attack was the illustrious Scaliger (q. v.), against whom, in 1607, he launched his *Scaliger Hypobolimæus* (Mainz). In this production, Henry IV. is also assailed. Sent in 1608 by the court of Rome to the diet of Ratisbon, for the purpose of observing the religious condition of Germany, he published in the same year more than twenty pamphlets against the Protestants, recommending the Catholic powers to use every means for their extermination. Such sentiments were, of course, highly satisfactory to the emperor of Germany, who was a devoted Catholic; and, in consequence, S., on visiting Vienna, met with a favorable reception, and was raised to the dignity of count-palatine. In 1611, he fired off two libels against King James I. of England; the first was entitled *Ecclesiasticus Auctoritati Ser. D. Jacobi, Mag. Brit. Regis, Oppositus* (Hartberg); and the second, *Collyrium Regium*, &c. Some three years after, when staying at Madrid, he was dreadfully beaten by the domestics of Lord Digby, the English ambassador in retaliation for the abuse of his sovereign. S. fled from Spain to Ingolstadt, where he issued his *Legatus Latro* against the ambassador. In 1618, S. went to Milan, where he resided for the next twelve years, devoting himself partly to philological studies, and partly to theological warfare. He died, 19th November 1649.

S. was a prodigious scholar, and might have rivalled Scaliger himself in reputation, as he did in learning, had it not been for the infirmities of his temper and judgment. To this day, his works, especially those on the Latin language, are reckoned valuable. The principal are: *Poemata Varia* (Heidelb. 1593); *Verisimilium Libri Quatuor* &c., (Nürnb. 1596); *Suspectæ Lectiones* (Nürnb. 1597); *De Arte Critica* (Nürnb. 1597); *Symbola Critica in Apuleii Opera* (Augsburg, 1605); *Observationes Linguæ Latinæ* (Frankf. 1609); *De Rhetoricarum Exercitationum Generibus* (Mil. 1628); *Grammatica Philosophica, sive Institutiones Grammaticæ Latinæ* (Mil. 1628); *Paradoxa Literaria* (Mil. 1628); *Mercurius Bilinguis*, &c. (Mil. 1628); *Rudimenta Grammaticæ Philosophicæ* (Mil. 1629); *Astrologia Ecclesiastica* (1634); *De Scholarum et Studiorum Ratione* (Pad. 1636); *Mercurius Quadrilinguis* (Basel, 1637), &c.

SCI'OTO, a river of Ohio, U. S., rises in the high lands of the north-west portion of the state, flows south-east to Columbus, then south to its junction at Portsmouth with the river Ohio. It is 200 miles long, flows through a rich valley, is navigable 130 miles, and for 90 miles feeds the Ohio and Erie Canal. It is crossed by numerous railways.

SCI'PIO, PUBLIUS CORNELIUS, surnamed AFRICANUS MAJOR, one of the most accomplished warriors of ancient Rome, but whose reputation is perhaps somewhat greater than his merits, was born 237 or 234 B.C. He is first mentioned as taking part, though only a youth, in the battle of the Ticinus (218 B.C.) where he saved his father's life. Two years later, he fought at Cannæ as a military tribune, and was one of the few Roman officers who escaped from that disastrous field. In 212 B.C., he was elected ædile, though not legally qualified by age, and in the following year, proconsul, with command of the Roman forces in Spain. His appearance there restored fortune to the Roman arms. By a bold and sudden march, he captured *Nova Carthago*, the stronghold of the Carthaginians, and obtained an immense booty. His humane and courteous manners won over many of the native chiefs; and when he commenced the campaign of 209 B.C., his superiority over his opponents in address, if not in generalship, was manifest.

At Bæcula, in the valley of the Guadalquiver, he defeated Hasdrubal with heavy loss, but could not prevent him from crossing the Pyrenees to the assistance of Hannibal. In 207 B.C., he won a more decisive victory over the other Hasdrubal, son of Gisco and Mago, at an unknown place called Silpia, or Elinga, somewhere in Andalusia—the effect of which was to place the whole of Spain in the hands of the Romans. Soon after, he returned to Rome, where he was elected consul (205 B.C.), though he had not yet filled the office of prætor; and in the following year he sailed from Lilybæum, in Sicily, at the head of a large army, for the invasion of Africa. His successes compelled the Carthaginian senate to recall Hannibal from Italy. This was the very thing that S. desired, and had labored to achieve. After some abortive efforts at reconciliation, the great struggle between Rome and Carthage, between S. and Hannibal, was terminated by the battle fought at Naragra, on the Bagradas, near Zama, 19th October 202 B.C., in which the Carthaginian troops were routed with immense slaughter. Hannibal advised his countrymen to abandon what had now become a hopeless and ruinous contest, and his advice was taken. Peace was concluded in the following year, when S. returned to Rome, and enjoyed a triumph. The surname of AFRICANUS was conferred on him; and so extravagant was the popular gratitude, that it was proposed to make him consul and dictator for life, honors that would have been the destruction of the constitution, but which S. was either wise enough or magnanimous enough to refuse. When his brother, Lucius, in 190, obtained the command of the army destined to invade the territories of Antiochus, S. served under him as legate; in fact, it was only when he offered to do so, that the senate granted Lucius the Province of Greece. The latter was victorious in the war, and on his return to Rome (189 B.C.), assumed (in imitation of his brother) the surname of ASIATICUS. But the clouds were now gathering heavily round the Scipios.

In 187 B.C., Cato Major and others induced two tribunes to prosecute Lucius for allowing himself to be bribed by Antiochus in the late war. He was declared guilty by the senate; his property was confiscated; and he himself would have been thrown into prison, had not his brother forcibly rescued him from the hands of the officers of justice. In 185 B.C., S. himself was accused by the tribune, M. Nævius; but instead of refuting the charges brought against him (and which were probably groundless), he delivered, on the first day of his trial, a eulogy on his own achievements, and opened the second day by reminding the

citizens that it was the anniversary of the battle of Zama, and therefore not a time for angry squabbling, but for religious services. He then summoned the people to follow him to the Capitol, to give thanks to the immortal gods, to pray that Rome might never want citizens like himself. His audience were electrified, and the thing was done before opposition became possible. To resume the trial, was out of the question; but S. felt that popular enthusiasm was not to be depended on; that the power of the oligarchy—of that compact body of ambitious and exclusive nobles—was irresistible; that its hatred of him was unappeasable, and that his day was over. He retired to his country-seat at Liternum, in Campania, where he spent the remainder of his life, and where he died, 183 or 185 B.C.—S. is commonly regarded as the greatest Roman general before Julius Cæsar; and certainly, in the brilliancy of his gifts and accomplishments, he was unsurpassed; but if his career be strictly criticised, it will be found that he owed as much to fortune as to genius. Nevertheless, he won a multitude of splendid successes, and made the most of his great advantages. His beauty, bravery, and courtesy; his proud, yet pious belief that the gods favored him with their inspiration, won him the love and reverence of soldiers and women; and his magnanimity towards his fallen rival, who flitted about the eastern courts in dreary exile, is a bright feature in his character, and nobly distinguishes him from the cruel-hearted oligarchs of the senate.

SCIPIO ÆMILIANUS, PUBLIUS CORNELIUS, surnamed AFRICANUS MINOR, born 185 B.C., was a younger son of Lucius Æmilius Paulus, who conquered Macedon, but was adopted by his kinsman, Publius Scipio, son of the great Scipio, who had married the daughter of that Lucius Æmilius Paulus who fell at Cannæ. S. accompanied his father on his expedition against Macedon, and fought at the decisive battle of Pydna, 168 B.C. In Greece, he made the acquaintance of Polybius the historian, who afterwards became one of his closest and most valued friends. In 151 B.C., he went to Spain as military tribune, in the wake of the consul Lucius Lucullus, where he distinguished himself alike by his valor and his virtue. Two years later began the third and last Punic war, which mainly consisted in the siege of Carthage. S. still held the subordinate position of military tribune; but the incapacity of the consuls Manius Manilius and Lucius Culpurnius Piso, and the brilliant manner in which he rectified their blunders, fixed all eyes upon him. The favorite both of the Roman army and the Roman people, S. was at length, in 147 B.C., when only a candidate for the ædileship, elected consul by an extraordinary decree of the Comitia, and invested with supreme command; old Cato, who could with difficulty be got to praise any one, applying to the young hero and his incapable comrades (according to Plutarch) the Homeric line—

He only is a living man ; the rest are flitting shades.

The story of the siege of Carthage, the despairing heroism of its inhabitants, the determined resolution, the sleepless vigilance, the incessant labors of S., are too well known to require description. Suffice it to say, that after a protracted defence of months, the city was finally taken by storm in the spring of 146 B.C.; and by the orders of the senate, it was levelled to the ground, and the plough-share driven over its site. S., a man of noble and refined soul, obeyed the savage behest with sorrow, even with horror. As he gazed on the ruin he had wrought, the thought flashed across his mind that some day Rome too might perish, and the words of the *Iliad* rose to his lips—

The day shall come when sacred Troy shall perish,
And Priam and his people shall be slain.

S., though probably the most accomplished Roman gentleman of his age, was rigorous in his observance of the antique Roman virtues; and when holding the office of censor in 142 B.C., he strove to follow in the footsteps of Cato. But his efforts to repress the increasing luxury and immorality of the capital were frustrated by the opposition of his colleague, Lucius Mummius, the rough conqueror of Corinth. In 139 B.C., S. was accused of the *crimen majestatis* by the tribune Tiberius Claudius Asellus, but was acquitted, and soon after was sent to Egypt and Asia on a special embassy. Meanwhile, however, affairs had gone badly in Spain. Viriathus, the Lusitanian patriot, had again and again inflicted the most disgraceful defeats on the Roman armies, and his example had roused the hopes of the Celtiberian tribes, who also rushed to war against the common foe. The contest continued with varying success; but the interest centers in the city of Numantia, whose inhabitants displayed amazing courage in the struggle with Rome. For long it seemed as if the Numantines were invincible—one consul after another finding their subjugation too hard a task—but at length, in 134 B.C., S., re-elected consul, was sent over to Spain; and after a siege of eight months, forced the citizens, who were dying of hunger, to surrender, and utterly destroyed their homes. He then returned to Rome, where he took a prominent part in political affairs, appearing as the leader of the aristocratic party, in consequence of which his popularity with the democratic party greatly declined. Although a brother-in-law of Tiberius Gracchus, whose sister, Sempronia, he had married, he rather disclaimed any sympathy with his political aims; and when he heard of the murder of his kinsman, quoted his favorite Homer: 'So perish all who do the like again.' His attempt (129 B.C.) to rescind that portion of the agrarian law of Tiberius Gracchus relating to the lands of the *Socii*, excited the most furious indignation. When he went home from the senate, he had to be accompanied by a guard. Next morning, he was found dead in his bed; the prevailing suspicion being, that he was murdered either by or at the instigation of Papirius Carbo, his most rancorous political enemy. S. was neither a rigid aristocrat nor a flatterer of the people. Inferior in splendor of genius to his adoptive grandfather, he surpassed him in purity of character, in simplicity of patriotism, and in liberality of culture.

SCI'RPUS, a genus of plants of the natural order *Cyperaceæ*. The English name Club-rush is sometimes given to them. The Common Bulrush (q. v.) is a familiar example. There are several British species, some of them very small in comparison with the Bulrush, as *S. cæspitosus*, called *Deer's Hair* in the Highlands of Scotland, which is only two or three inches high, and abounds in moors, affording food to sheep in spring. The root-stocks of *S. dubius* are eaten by the natives of the south of India; as are the tubers of *S. tuberosus*, which is called *Pi-tsi* by the Chinese, and is cultivated by them in tanks and ponds, copious supplies of manure being given. The tubers are roundish.

SCI'RRHUS (Gr. hard), a term applied to a kind of Cancer (q. v.).

SCITAMI'NEÆ, or ZINGIBERA'CEÆ, a natural order of endogenous plants, herbaceous perennials. There are about 250 known species, among which are the different kinds of Ginger, Galangale, Zedoary, Cardamom, Grains of Paradise, Turmeric, &c. Most of them are notable for their aromatic properties, which reside chiefly in their root-stocks or in their seeds. The root-stocks of some, particularly when young, contain much starch, which is used as arrow-root. All the species are tropical or sub-tropical.

SCIU'RIDÆ. See SQUIRREL.

SCLERODE'RMI, Cuvier's name for the family of fishes called *Balistidæ* by Müller. See BALISTES.

SCLEROGE'NIDAE. See MAILED CHEEKS.

SCLERO'STOMA (from the Gr. *scleros*, hard, and *stoma*, the mouth) is the term applied to a well-known genus of the family of *Strongylidæ*, belonging to the order of round worms or Nematoidea (q. v.). One species, the *Sclerostoma syngamus*, is of special

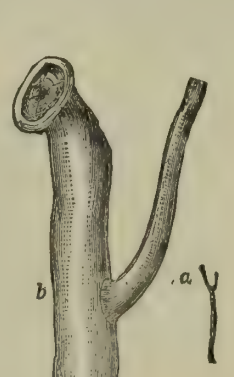


Fig. 1.—Sclerostoma syngamus.
a, Male and female—natural size; *b*, upper part of the same, enlarged (from Cobbold). The male is the smaller worm on the right side of these figures.

Fig. 2.—Sclerostoma duodenale. Male specimen.
1, The natural size; 2, the same magnified, and seen laterally; *a*, generative organ; *b*, region of anus.

interest, as being the cause of the disease in poultry known as the Gapes (q. v.). Since the article GAPES was published, it has been ascertained that the entozoon which infests the windpipe of the diseased birds is not a trematoid (or fluke-like) worm, but a round worm, possessing many very singular properties. Dr. Cobbold, to whom we are mainly indebted for our knowledge of this worm, removed from a chloroformed fowl with the gapes, seven sclerostomata. 'Six of these parasites were united in pairs, the odd worm being a female, from which the male had in all likelihood been rudely torn during the withdrawal of the forceps' (*Entozoa*, 1864. p. 86). The females thus extracted had an average length of $\frac{4}{5}$ths of an inch; while the males scarcely exceeded $\frac{1}{2}$th of an inch. In both sexes, the breadth of the body was nearly uniform throughout, being about $\frac{1}{36}$th of an inch in

the female, and only $\frac{1}{65}$th of an inch in the male. The mouth of the female is furnished with six prominent chitinous lips. According to Siebold, after sexual congress, 'there is ultimately a lasting continuity of the sexes by means of an actual growing together'—one of the most remarkable facts ever recorded in natural history. Hence the eggs, which are comparatively large, and many of which contain fully formed embryos, can only escape by a breaking-up of the body of the parent.

'By whatever mode,' says Dr. Cobbold, 'the young make their *exit* from the shell, it is manifest, that prior to their expulsion, they are sufficiently developed to undertake an active migration. Their next habitation may occur within the bodies of certain insect larvæ, or even in small land molluscs; but I think it more likely that they either enter the substance of vegetable matters, or bury themselves in the soil at a short distance from the surface.'

Considering that this worm infests the trachea of the domestic fowl, the turkey, the pheasant, and the partridge, as well as of many birds of less importance (as the magpie, the black stork, the starling, the swift, &c.), it is of the greatest importance to check its development. With this view, the worms must not only be removed by the means described in the article GAPES, and more fully in Cobbold's *Entozoa*, pp. 90, 91, but they must be *totally destroyed*, after their removal. If they be merely killed, and thrown on the ground, the mature eggs will probably remain uninjured; and when decomposition sets in, the young embroys will, sooner or later, escape from the shells, migrate in the soil or elsewhere, and ultimately find their way—how, we cannot tell—into the air-passages of certain birds, in the same manner as their parents did before them.

Dr. Cobbold, whose classification of intestinal worms will doubtless for many years be the standard one, places the *Dochmius anchylostomum*, or *Anchylostoma duodenale* (see STRONGYLIDÆ), in this genus, with the name of *Sclerostoma duodenale*. This worm, which usually measures about $\frac{1}{3}$d of an inch in length, is especially characterized by an asymmetrical disposition of four horny, conical, oval papillæ, of unequal size, forming the so-called teeth. The female is larger than the male in about the ratio of 4 to 3, and is the more numerous in the ratio of 3 to 1. This worm was first discovered by Dubini at Milan in 1838, and though at first thought rare, is now known to be tolerably common throughout Northern Italy. It is remarkably abundant in Egypt, where Pruner found it in nearly every corpse, sometimes, in hundreds of specimens, in the jejenum, and to a less extent in the duodenum. Griesinger, in his Memoir *On the Frequency of Entozoa in Egypt, and the Diseases they occasion* (1854) considers that about one-fourth of the population are constantly suffering from a severe anæmic chlorosis, occasioned solely by the presence of this parasite. A tolerably full account of this disorder, and of the treatment to be adopted, is given by Küchenmeister in his *Manual of Parasites*, vol. i. pp. 386—389.

SCLERO'TIUM, a spurious genus of fungi, now regarded as merely the mycelium of fungi, and these probably of very different kinds, which have been arrested in their development, assuming a peculiar form. This form is that of a fleshy mass, often a ball. Examples are to be found among almost all kinds of decaying vegetable matter, as fruits, esculent roots, &c. When a crop of onions rots off, as is often the case, to the vexation of the gardener, a S. will generally be found attached to the bulbs in the form of little irregular black masses, or as a multitude of small granules. On the under side of decaying cabbage-leaves, and scattered on the ground beneath the plant to which they belong, may in like manner be seen little balls, varying from white or reddish-brown to dark brown and black, in size about equal to cabbage-seeds, whence stories of showers of seeds have sometimes originated.

SCO'LEX. See TAPE-WORMS.

SCOLOPA'CIDÆ, a family of birds of the order *Grallæ*, having a long, feeble, soft, and somewhat flexible bill, which is remarkably furnished with nerves, particularly towards the tip, so as to be extremely sensitive, whilst many of them have also a peculiar muscle, enabling them to separate the points of the mandibles the moment that their prey is felt. They are thus admirably fitted for seeking their food—which generally consists of worms, slugs, &c.—in mud, soft earth, or wet sand. The membrane of the tip of the bill is almost pulpy in many of them. The species are numerous, and very widely distributed, generally inhabitants of swampy or very moist places. Snipes, woodcocks, sand-pipers, and curlews are familiar examples.

SCOLOPE'NDRA. See CENTIPEDE.

SCOLOPE'NDRIUM. See HART'S TONGUE.

SCOLY'TUS, a genus of coleopterous insects of the family *Xylophagi*. See BARK-BEETLE. One species *S. destructor*, a beetle only about one-sixth of an inch in length, of a dull color, with short antennæ, thickened at the extremity, has of late years destroyed great numbers of fine elms in the neighborhood of London and elsewhere in England. The female insect burrows in the wood, and lays a row of eggs; the larvæ, as soon as they are

Scolytus destructor, and Section of Wood, showing the burrows of the larvæ.

hatched, begin to feed upon the wood, and eat their way in long tunnels, diverging on all sides from the original one. This pest appears to be spreading in England.

SCOMBERESO'CIDÆ, a family of fishes, of the order *Plectognathi*, having the maxillary bones united with the elongated premaxillaries at the corners of the mouth. The Fying-fish (*Exocœtus*) belongs to this family. The Gar-fish and the Saury Pike are the only species common on the British coasts. Until the Plectognathi were recognized as a separate order, the S. were reckoned as belonging to the *Esocidæ*, or pike family.

SCOMBE'RIDÆ, or SCO'MBRIDÆ, a large family of acanthopterous fishes, containing many species highly esteemed as articles of food, and some of them of great value on account of the abundance in which they are caught. Some of them attain a large size. They have a smooth body, covered generally with small scales, and often very beautifully colored; the tail-fin generally large, and the tail very muscular and powerful. The gill-covers have no armature. The sides of the tail are often keeled and armed with sharp-keeled scales. The front spines of the anal fin are generally detached, and sometimes those of the first dorsal fin. The second dorsal fin is often represented by numerous finlets, as in the Mackerel (q. v.). To the same tribe with the mackerel, characterized by finlets and by the want of armature on the lateral line, belong the Bonito (q. v.), the Tunny (q. v.), the Albacore (see TUNNY), and the Seir-fish (q. v.) The importance of the Mackerel fishery is well known, also that of the Tunny fishery of the Mediterranean. The Sword-fish (q. v.) is an example of another group, comprising only a few species, having no finlets, and remarkably characterized by the dagger-like prolongation of the muzzle. The Pilot-fish (q. v.) belongs to a tribe having the first dorsal represented by isolated spines. There are other tribes or groups, some having the lateral line cuirassed, some not having this armature, and not having finlets nor detached spines. The Dory (q. v.) and allied genera, often regarded as forming a tribe of S., have been constituted into a distinct family, *Zeidæ*.—The S. are all marine. They are more numerous in warm than in cold climates, although some are found in very northern seas, of which the mackerel is the most important instance. It and the Scad (q. v.), or Horse Mackerel, are the only species common on the British coasts, although several others are known as of rare occurrence.

SCONCE, in Fortification, is a term applied to any small redoubt or fort, detached from the main works for some local object, as the defence of a pass, or ford, &c. The word is not now often used.

SCONCE, a candlestick affixed to a wall by a bracket, and frequently with a mirror or other reflector.

SCONE (pronounced *Scoon*), a parish in Perthshire, lying on the left bank of the Tay, about two miles from Perth. It is famous as the seat of one of the most venerable of Scottish abbeys. S. is first mentioned in the beginning of the 10th c., when a council was held there in the 6th year of the reign of King Constantine, at which time it is styled, by the Chronicle which records the fact, *regalis civitas*, the royal city. A monastery was built at S. probably about the same period, and there was located the famous stone on which the kings of the Scots were inaugurated, and which was carried by Edward I. of England to Westminster Abbey. In place of the ancient monastery, an abbey of Canons Regular was founded by Alexander I., in 1115, and there the sovereigns continued to be inaugurated and crowned. Alexander III., the last of the ancient race of kings, and Robert Bruce, the founder of the new dynasty, were crowned at S.; but after the accession of the House of Stuart, the coronation sometimes took place in other churches. In the summer of 1559, when Perth was held by the Lords of the Congregation, a disorderly multitude of their adherents assaulted the monastery of S., set it on fire, and left it a blackened ruin. The last coronation which was celebrated at S. was that of Charles II., on the 1st of January 1651. The abbey church had never been restored, and the solemnity

took place in the parish kirk, the crown being placed on the king's head by the Marquis of Argyle. In January 1716, the Jacobite leaders endeavored to encourage their followers by fixing a day for the coronation of the Chevalier at S., but the design was abandoned. In the reign of James VI., the abbey of S. was erected into a temporal lordship in favor of Sir David Murray, afterwards created Viscount of Stormont. The great chief-justice, the Earl of Mansfield, a younger son of the fifth Viscount Stormont, was born at S.; and the Scottish peerage is now merged in the British earldom. The Viscounts of Stormont had a residence near the site of the abbey, and hence known as the Palace of Scone. The present palace was erected on the same site in the beginning of this century.

SCO'PAS, a celebrated Greek sculptor and architect, belonging to the later Attic school, the head of which was Praxiteles (q. v.), was born in the island of Paros, and flourished during the first half of the 4th c. B.C. Nothing is known regarding his life or the period of his death. His principal architectural works are: 'The Temple of Athena Alla at Tegea,' the first both in point of size and beauty in the Peloponnesus; 'The (second) Temple of Diana at Ephesus' (though Deinocrates is also and even more generally named as the architect of this building); some of the bas-reliefs in the famous Mausoleum erected by Artemisia, queen of Caria, in memory of her husband (and now in the British Museum). His sculptures, by which we mean his single statues and groups illustrating the divinities of Greek mythology, were very numerous, and for the most part were executed in marble. They embrace subjects from the myths of Aphrodite (Venus), Dionysus (Bacchus), Apollo, Artemis (Diana), &c. But perhaps the noblest, and certainly the most famous piece of sculpture executed by S., was that which latterly stood in the Flaminian Circus at Rome, and represented Achilles conducted to the island of Leuce by the divinities of the sea. It included statues of Neptune, Thetis, the Nereids, Tritons, and a variety of sea-monsters, and according to Pliny, the whole was so beautiful, that it would have been sufficient to have immortalized S., even if he had done nothing more.

SCOPE'LIDÆ. See SALMONIDÆ.

SCORE, in Music, compositions for several voices or instruments, or for an orchestra, so written, that each part has a separate staff for itself, these staves being placed over each other, bar corresponding to bar. It is so called because the bars are *scored* or drawn through all the parts from top to bottom. Occasionally, where there is a deficiency of staves for all the parts, or where any of the parts have so little to do that it is not worth while to assign them a separate staff, parts related to or connected with each other, as two flutes, two clarionets, or three trombones, may be written on the same staff together. The arrangement or distribution of the parts in a score is matter of some importance. As a general rule, the highest part should be placed uppermost, then the next lower, and gradually descending. All the parts of a chorus should be placed together. Perfection in reading score is not very easily attained, but is necessary for a thoroughly trained musician. The student of music who can read or play the great master-works from the score, will become far more intimately acquainted with them than he could by mere piano-forte arrangements, and will come to understand the means by which their composers have produced the wonderful effects that are to be found in their music. The use of so large a number of clefs, and the practice which has obtained of writing parts for particular instruments in other keys, have added greatly to the difficulty of studying the score. Among various suggestions for simplifying the score, one which was lately advocated in Brown's *Elements of Musical Science*, consists in the use of but one clef, the bass or F clef, the other parts being distinguished from the bass by short bars attached to the clef, which direct the performer to take the notes one, two, or three octaves higher.

SCORESBY, WILLIAM, D.D., a celebrated Arctic explorer and savant, was the son of William Scoresby, the most distinguished whale-fisher of his time, and was born at Cropton in Yorkshire, October 5, 1789. He commenced a seafaring life at the age of ten, and in his 21st year, succeeded his father as commander of the *Resolution*, and carried on the business of whale-fishing. After having made 17 voyages to the Spitzbergen and Greenland whaling-grounds, he published the results of his observations of the countries within the Arctic Circle in *An Account of the Arctic Regions* (2 vols., 1820), a work which not only increased and extended the author's reputation, but added largely to the sciences of meteorology, hydrography, and natural history. In 1822, he explored the east coast of Greenland, a tract hitherto wholly unknown, and published in the following year at Edinburgh an account of this expedition and its fruits. In 1824, he was elected a Fellow of the Royal Society of London, and some time after was chosen *correspondent* of the French Institute. He had retired from his profession in 1822, and now proceeded to give effect to a strong desire which had long possessed him, of becoming an authorized teacher of religion, by entering himself at Queen's College, Cambridge; he graduated as B.D. in 1834, subsequently (1839) received the degree of D.D., and labored faithfully and zealously, first at Liverpool and afterwards at Bradford, till failing health compelled him to retire to Torquay. He still continued his physical researches, giving special attention to terrestrial magnetism, especially in its relation to navigation; and published the results, many of which were of great value and interest, in the form of Memoirs, in the *Philosophical Transactions*, the *Transactions of the Royal Society of Edinburgh*, the *Reports of the British Association*, and subsequently in an improved form in his *Magnetical Investigations* (Lond. 2 vols. 1839—1852).

For the better prosecution of these researches, he made a voyage to the United States in 1847, and to Australia in 1853, returning from the last-named country in 1856, enfeebled in health by the arduous labors which he had undergone. He died at Torquay on March 21, 1857. Besides his work on *Zoistic Magnetism*, which described a series of researches entered into for the purpose of eliciting some natural connection between magnetic and mesmeric agencies, he published various works of a religious nature. His life has been written by his nephew, R. E. Scoresby-Jackson (Lond. 1861).

SCO'RIÆ are the cinders and slags of volcanoes, more or less porous from the expansion of the gases contained in the melted materials. See VOLCANIC ROCKS.

SCORPÆ'NA, a genus of fishes, of the family of *Mailed Cheeks*. The head is large and compressed, more or less armed with spines or tubercles. The body is of a somewhat perch-like form. Some of the *Scorpænæ* are remarkable for their ugliness; some exhibit very fine colors. They are numerous in the Mediterranean, and widely distributed in the seas of warm climates. They frequent rocky shores in shoals, and feed on crustaceans, small fishes, &c. They are popularly called *Hog-fish* and *Scorpion-fish*. The flesh is dry and tasteless, but the liver yields a useful oil.—The Bergylt (q. v.) belongs to a nearly allied genus.

SCO'RPION (*Scorpio*), a genus of *Arachnida*, of the order *Pulmonaria*, formerly including the whole of the family *Scorpionidæ*, to all of which the popular name is still extended. Scorpions are natives of warm climates, both in the eastern and western hemispheres. The species are numerous. They have the body elongated,

Scorpion (*Scorpio Europæus*).

and no marked division between the thorax and abdomen. Six segments of the abdomen are broad; but the last six are narrow, forming a tail; and the last segment is modified into a curved and sharp sting, having two pores on its lower side, from which the venom flows, supplied by two poison glands in the base of the segment. The palpi are modified into pincers or claws like those of the lobster, by means of which prey is seized. There are four spiracles or breathing pores on each side of the abdomen. There are two remarkable comb-like appendages on the under surface of the thorax, the use of which is unknown. The number of eyes is various; in the restricted genus *Scorpio*, of which the COMMON S. (*S. Europæus*) of the south of Europe is an example, there are only six: but in some of the genera eight and twelve. Scorpions feed on beetles and other insects, and after seizing them, pierce them with a sting before eating them. They also eat the eggs of spiders, &c. They lurk under stones and in holes and crevices, but come forth to seek their prey, running with great activity. In running, they carry the tail curled over the back. When alarmed or irritated, they show great fierceness, evidently aware of the power of their sting, and moving it in all directions, as if threatening an adversary. They are universally disliked, and not a little dreaded, being apt to get into houses, and into beds, hiding themselves under pillows, in shoes, boots, &c., so that accidents are very frequent in countries where they abound.

The sting of a S. is seldom fatal, but even that of the Common European S. is very painful, and that of some of the largest species—which are six inches long—is much more severe, attended with much nausea and constitutional derangement, nor do the effects soon cease. It is of use to press a large key or other tube on the wound, so as to force out part of the poison. The best remedy is ammonia, internally administered, and also applied externally.

The female S. displays great regard for her young, which she

carries for some time clinging in great numbers to her back, limbs, and tail.

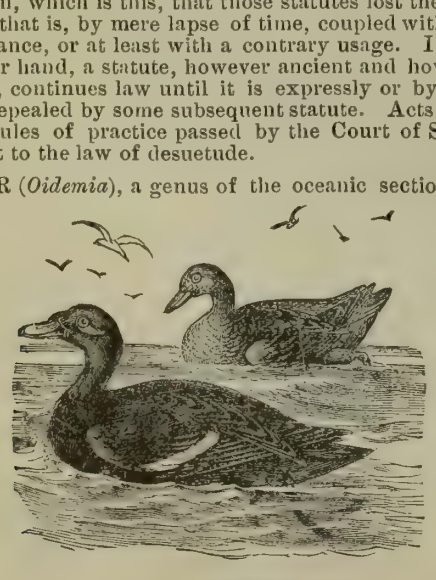
SCORZONE'RA, a genus of plants of the natural order *Compositæ*, suborder *Cichoraceæ*, having yellow or rarely rose-colored flowers. The species are numerous, mostly natives of the south of Europe and the East. No species is found in Britain. The Common S. of our kitchen-gardens, *S. Hispanica*, a native of the south of Europe, has long been cultivated for its esculent roots. The root is black externally, white within, about the thickness of a man's finger, long, and tapering very gradually, whence the name *Viper's Grass*, sometimes given to the plant, the root being supposed to resemble a viper. It contains a white milky juice, and has a mild sweetish mucilaginous taste; it is very pleasant when boiled, the outer rind being first scraped off, and the root steeped in water, to abstract part of its bitterness. The leaves are an inferior substitute for mulberry leaves in feeding silkworms.—Other species of S. are used in the same way.

SCOT, REGINALD, a writer who has acquired an honorable reputation as an early disbeliever in the reality of witchcraft, was a younger son of Sir John Scot of Scotshall, near Smeethe in the county of Kent, and was born in the first half of the 16th century. He studied at Oxford, and on his return home devoted himself exclusively to learned pursuits. Nothing further is known regarding him except that he died in 1599. His famous work, entitled *The Discoverie of Witchcraft*, was published in 1584, and is designed to demonstrate the absurdity of the prevalent belief on the subject. It is full of learning, and is marked in many passages by sound sense and humane feeling, qualities that naturally excited the antipathy of a person like King James, who wrote his *Dæmonology*, as he tells us, 'chiefly against the damnable opinions of Wierus and Scot; the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft.' But the 'British Solomon' only reflected the general ignorance and superstition of his age, and S. had to run the gauntlet of a series of 'Answers' and 'Refutations' by a number of 'eminent' divines, as well as by Glanvil, the author of the *Scepsis Scientifica*. S.'s book was ordered to be burned by the common hangman, and copies of it are now extremly rare. Besides *The Discoverie of Witchcraft*, S. wrote *A Perfect Platform of a Hop Garden*.

SCOT AND LOT VOTERS. The old legal phrase *Scot* (Ang.-Sax. *sceat*, pay) *and Lot* embraced all parochial assessments for the poor, the church, lighting, cleansing, and watching. Previously to the Reform Act, the right of voting for members of parliament and for municipal officers was, in various English boroughs, exclusively vested in payers of Scot and Lot.

SCOTCH STATUTES frequently mean the ancient acts of parliament beginning with the reign of James I. of Scotland, and continuing down to the Union of England and Scotland. There are also many statutes passed since that date which are applicable exclusively to Scotland, and these are to be found among the statutes at large. The rules of construction of Scotch statutes do not differ from those affecting English or British statutes. One peculiarity, however, distinguishes the old Scotch statutes prior to the Union, which is this, that those statutes lost their force by desuetude, that is, by mere lapse of time, coupled with neglect or non-observance, or at least with a contrary usage. In England, on the other hand, a statute, however ancient and however little acted upon, continues law until it is expressly or by strong implication, repealed by some subsequent statute. Acts of Sederunt —that is, rules of practice passed by the Court of Session—are also subject to the law of desuetude.

SCO'TER (*Oidemia*), a genus of the oceanic section of ducks,



Velvet Scoter (*Oidemia fusca*).

having a short broad bill with an elevated knob at the base of the upper mandible, the tip much flattened, and terminated by a large flat nail, the mandibles laminated with broad stong widely separated plates; the wings of moderate length; the tail short and acute; the feet very large; the plumage generally very dark. Their food consists chiefly of marine shell-fish, crustaceans, &c. They obtain their food by diving.—The COMMON S., or BLACK S. (*O. nigra*), is about the size of the common duck. The whole plumage of the male is deep black; the bill and legs are also black, except a line of orange along the ridge of the upper mandible. The female is dark brown. The black S. is abundant in winter on many parts of the British coast, migrating to more northern regions in spring. The flesh is oily, and has a fishy taste; but being therefore permitted to Roman Catholics during Lent, is in great request in some countries, so that at Marseille, Aix, and other places in the south of France, arrangements are made by the magistrates for an annual shooting or *battue* of scoters; in the north of France and in Shetland they are commonly netted.—The VELVET SCOTER (*O. fusca*) is a less common winter visitant of Britain, plentiful only in Orkney.

SCO'TIA. See MOULDINGS.

SCO'TLAND. For the Geography, see GREAT BRITAIN. *History.*—An account has been given under the article Picts (q. v.) of the early inhabitants of the country which has long been known by the name of Scotland. The original Scotia or S. was Ireland, and the Scoti or Scots, at their first appearance in authentic history, were the people of Ireland. The Scots were a celtic race, and their original seat in Northern Britain was in Argyle, which they acquired by colonization or conquest, before the end of the 5th c., and from whence they spread themselves along the western coast from the Firth of Clyde to the modern Ross. The name of S. seems first to have been given to the united kingdom of the Picts and Scots in the 10th century. It was then sometimes styled, by way of distinction, *Scotia Nova* (New Scotland), and it was a considerable time afterwards before the name of S. was applied to it, to the exclusion of Ireland. This interchange of names was a fruitful source of dispute between Irish and Scottish writers in the 16th and following centuries, and it can hardly be said that even now the controversy is entirely at an end.

The first prince of the British Scots mentioned in our authentic annals was Fergus, son of Erc, who crossed over to Britain about the year 503. His nation had been converted to Christianity by St. Patrick, and Fergus himself is said to have received the blessing of the saint in his early years. His great-grandson, Conal, was king of the British Scots when Columba (q. v.) began the conversion of the Northern Picts; and by that prince, according to the best authorities, Iona was given for the use of the mission. Conal was succeeded by his nephew, Aidan, who was inaugurated as sovereign by St. Columba in the island of Iona—a ceremony which Scottish writers, misled by the great French antiquary Martene, long believed to be the first example of the benediction of kings. Aidan was a powerful prince, and more than once successfully invaded the English border, but towards the end of his reign he received a severe defeat from the Northumbrian sovereign Ethelfrid at the battle of Degsestan.

The history of Aidan's successors is obscure and uninteresting, except to the professed students of our early history. Their kingdom was overshadowed by the more powerful monarchy of the Picts, with which, as well as with its neighbors in the south—the Britons of Cumbria—it was engaged in almost unceasing conflict. The Scots were for a time under some sort of subjection to the English of Northumbria, but recovered their independence on the defeat and death of King Egfrid in battle with the Picts at Nechtansmere in 685. In the middle of the 9th c., by a revolution, the exact nature of which has never been ascertained, the Scots acquired a predominance in Northern Britain. Kenneth, son of Alpin, the lineal descendant of Fergus and Aidan, succeeded his father as king of the Scots in 836. The Pictish kingdom was weakened by civil dissension and a disputed claim to the crown. Kenneth laid claim to it as the true heir in the female line, and was acknowledged king in the year 843.

King Kenneth transferred his residence to Forteviot in Stratherne, which had been the Pictish capital, fixing soon afterwards the ecclesiastical metropolis of the united kingdom at Dunkeld, where he built a church, dedicated to St. Columba. The Picts and Scots, each speaking a dialect of the Celtic tongue, gradually coalesced into one people, whose territory extended from the Firths of Forth and Clyde to the northern extremity of Britain. The crown descended to a line of princes of the family of Kenneth, whose rule gave a unity and comparative tranquillity to the Scots of Britain, which those of Ireland, at no time really united under one prince, never possessed, and the good effects of which, as contrasted with the state of the sister island, are experienced to the present day. The first interruption to the descent of the crown in the line of Kenneth was the reign of a usurper named Grig, round whose name, amplified to Gregory by the writers of a later age, a cloud of legendary fiction gathered. The old family was restored on his expulsion in 893.

The reign of Constantine, son of Aodh, who succeeded in 904, was a remarkable one. In his time, it is probable that the seat of the ecclesiastical primacy was transferred from Dunkeld to St. Andrews, and that the regal residence was fixed at Scone. At the latter place, in the sixth year of his reign, the chronicles mention that Constantine, the king, Kellach, the bishop, and the Scots, swore to observe the laws and discipline of the faith and the rights of the churches and the gospels. This seems to indicate the meeting of some sort of council, civil or ecclesiastical, or more probably a combination of both, according to the form prevalent at this period both among the Celtic and the Teutonic nations. Even before the establishment of the kingdom of the Picts and Scots in the person of Kenneth, Northern Britain had experienced the attacks of a new enemy, the Scandinavian invaders, generally spoken of under the name of Danes. Constantine resisted them bravely, but towards the end of his reign he entered into an alliance with them in opposition to the English. A powerful army, composed of Scots and Picts, Britons and Danes, disembarked on the Humber, and was encountered at Brunanburgh by Athelstane, king of England. A battle was fought there, the first of a series of unfortunate combats by Scottish princes on English ground. The confederate army was defeated, and though Constantine escaped, his son was among the slain. Weary of strife, the king soon afterwards retired to the Culdee monastery at St. Andrews, of which he became abbot, and where he died in 953.

During the reign of Malcolm the first of that name, and the successor of Constantine, a portion of the Cumbrian kingdom, including the modern Cumberland and part of Westmoreland, which had been wrested from the Britons by Edmund, king of England, was bestowed by that prince on the Scottish sovereign. This grant was the foundation of that claim of homage made by the English kings on the Scottish sovereigns, which afterwards became the cause or the pretext for the great struggle between the two nations. The northern kingdom was still further increased in the reign of Kenneth, son of Malcolm, by the acquisition of Lothian, and of Northern Cumbria, or Strathclyde. The former province, formerly a part of the Northumbrian kingdom, and entirely English in its population, was bestowed on Kenneth by Edgar, king of England. The Cumbrain kingdom, which had at one time extended along the west coast from the Firth of Clyde to the border of Wales, had been weakened by the loss of its southern territories; and it now fell under the dominion of the Scottish king. The last addition to Scotland in the south took place under Malcolm II., son of Kenneth, who acquired the Merse and Teviotdale from the Earl of Northumbria, and thus advanced his kingdom on the eastern border to the Tweed. The reign of Malcolm II. extended from 1003 to 1033. The kings who immediately followed are better known to the general readers than any of their predecessors, poetry having made their names familiar to every one. Malcolm's successor was his grandson, Duncan, whose brief reign was followed by that of Macbeth (q. v.). The latter was a vigorous and prudent ruler, munificent to the church, and famous as the only Scottish king who made a pilgrimage to Rome. But although by marriage he was connected with the royal line, he was unable to secure the affection of his subjects. Malcolm, the eldest son of Duncan, assisted by his kinsman, Siward, Earl of Northumbria, invaded Scotland. The usurper was defeated and slain at Lumphanan, in Mar, in 1056, and Malcolm was acknowledged as king.

The long reign of Malcolm III. was the commencement of a great social and political revolution in Scotland. His residence in England, and still more his marriage with the English Princess Margaret, the sister of Edgar Atheling, led to the introduction of English customs, the English language, and an English population into the northern and western districts of the kingdom, which hitherto had been for the most part inhabited by a Celtic race. The influx of English colonists was increased by the tyranny of William the Conqueror and his Norman followers. All received a ready welcome from the Scottish king, whose object it was to assimilate the condition of the Scots in every respect to that of their fellow-subjects in Lothian; and what his stern, though generous, character might have failed to accomplish, was brought about by the winning gentleness and Christian graces of his English queen.

Malcolm fell in battle before Alnwick Castle in the year 1093, and Margaret survived only a few days. On this event, it seemed as if the work of their reign was about to be utterly overthrown. The Celtic people of Scotland, attached to their old customs, and disregarding the claims of Malcolm's children, raised his brother, Donald Bane, to the throne. The success, however, of this attempt to restore a barbarism which the better part of the nation had outgrown, was of brief duration; Donald was dethroned, and Edgar, the eldest surviving son of Malcolm and Margaret, was acknowledged as king. The very name of the new sovereign marked the ascendency of English influence. That influence, and all the beneficial effects with which it was attended, continued to increase during the reigns of Edgar and his brother and successor, Alexander I.

The change went steadily on under the wise and beneficent rule of David (q. v.), the youngest son of Malcolm. His reign, which extended from 1124 to 1153, was devoted to the task of ameliorating the condition of his subjects, and never was such a work more nobly accomplished. David was in every respect the model of a Christian king. Pious, generous, and humane, he was at the same time active and just, conforming himself to the principles of religion and the rules of the church with all the devotion of his mother, but never forgetting that to him, not to the clergy, God had committed the government of his kingdom. He was all that Alfred was to England, and more than St. Lewis was to France. Had he reigned over a more powerful nation, his name would have been one of the best known among those of the princes of Christendom. As it is, every Scottish scholar has delighted to do his character justice. At the time of David's accession, Scotland was still but partially civilized, and it depended in a great measure on the character of its ruler whether it was to advance or recede. It received a permanent stamp from the government of David. The Celtic people were improved morally, socially, and ecclesiastically, and all along the eastern coast were planted Norman, English, and Flemish colonies, which gradually penetrated into the inland districts, and established the language and manners of that Teutonic race which forms the population of the greater part of Scotland. David encouraged and secured the new institutions by introducing a system of written law, which gradually superseded the old Celtic traditionary usages, the first genuine collections of Scottish legislation belonging to his reign. David was as great a reformer in the church as in the state.

The ecclesiastical system prevalent in Scotland almost up to his time differed in some points from that established in England and on the continent, bearing a great resemblance to that of Ireland, from which it was indeed derived. David established dioceses, encouraged the erection and endowment of parishes, provided for the maintenance of the clergy by means of tithes, and displacing the old Celtic monastic bodies, introduced the Benedictine and Augustinian orders.

David, though devoting his energies to the improvement of his subjects in the manner which has been mentioned, did not forget duties of a less agreeable kind. He knew that a Scottish king really held his crown by the tenure of the sword, and none of his fierce ancestors was a more intrepid warrior than the accomplished and saintly David. His skill and courage were shown, though without success, at the Battle of the Standard. As the representative through his mother of the ancient kings of England, he had many friends in that country; and had the Scottish army been successful, the history of the two kingdoms might in some respects have been different. As it was, he contented himself with maintaining the cause of his sister's child, the Empress Matilda, against King Stephen.

David's grandson and successor, Malcolm IV., reigned for twelve years, and the next king was William the Lion, Malcolm's brother, who ruled from 1165 to 1214. These princes pursued the policy of their grandfather with equal resolution, though sometimes with less success. They were embarrassed by their connection with the English King Henry II., who took advantage of his superior power and ability to impose unwise and unjust restraints on the independence of the Scottish sovereigns and their kingdom —a policy which laid the foundation of the unhappy national strife of after years. This was averted for a time by the concessions of Richard I. in 1189. 'For more than a century,' says Lord Hailes, 'there was no national quarrel, no national war between the two kingdoms—a blessed period.' That period was well employed by the next two kings, Alexander II. and Alexander III., the son and grandson of William the Lion, to consolidate the institutions of their kingdom, and extend and confirm what had been begun by David. Alexander III. was one of the ablest and best of the Scottish kings. By a treaty with the king of Norway, he added to his kingdom Man and the other islands of the Western Sea, held by the Norwegians. His sudden death, in 1286, was one of the greatest calamities with which Scotland could have been afflicted. It closed a period of prosperity—a course of improvement—which the kingdom did not again enjoy for nearly 500 years. The history of this interesting period has yet to be written. The only modern account of any value is that in the accurate but meagre Annals of Lord Hailes. Tytler begins his History with the reign of Alexander III.; and Robertson, in his narrative of two reigns—which in popular language is called the History of Scotland, just as Lord Macaulay's similar work is called the History of England—speaks of what took place during the whole time from the union with the Picts to the death of Alexander III., as 'events which may be slightly touched, but merit no particular or laborious inquiry.'

On the death of the infant grand-daughter and heiress of Alexander III., in 1290, the succession to the crown was disputed. The question between the two chief claimants, Baliol and Bruce

(q. v.), was not free from doubt according to the customs of the time; and Edward I. of England, to whom the decision was referred, appears at first to have acted with good faith. But this great king, who had already subdued Wales, was now bent on uniting the British Islands under one sceptre; and in the pursuit of that object he sacrificed humanity, honor, and justice. The results were most deplorable. The national spirit of the Scots was finally roused, and after a long struggle under Wallace and Bruce they secured their independence on the field of Bannockburn (q. v.). The battle of freedom was won; but it was at the expense of tranquillity and civilization. The border counties were continually wasted by the English; the central provinces were the scene of frequent warfare among the chief nobles; and the highland districts became more and more the seat of barbarism, the Celtic tribes reacquiring something of their old ascendency, just as they did in Ireland in the troubled times which followed the invasion of Edward Bruce. The strong arm of King Robert might have repressed these disorders, had his life been longer spared after the treaty of Northampton; but his death, and the accession of an infant son, again plunged the country into all the miseries of foreign and civil war. When that son, David II., grew up to manhood, he proved in every respect unworthy of his great father. His reign, and that of his successors Robert II. and Robert III, the two first princes of the House of Stewart, were the most wretched period of Scottish history. In the year 1411, half of the kingdom would have become absolutely barbarous, if the invasion of the Lord of the Isles had not been repulsed at Harlaw (q. v.), by the skill of the Earl of Mar, and the bravery of the lowland knights and burgesses.

A happier time began to dawn on the release of James I., in 1424, from his English captivity. The events of the following period are better known, and a brief notice of the most important will be sufficient. Reference may be made for details to the accounts of the particular kings. The vigorous rule of James I. had restored a tranquillity to which his kingdom had long been unaccustomed; but strife and discord were again brought back on his assassination. One of the most calamitous features of the time, was a succession of minorities in the sovereign. James himself had succeeded when a child and a captive; James II., James III., James IV., James V., Mary, and James VI., all succeeded while under age, and all, except James IV., when little more than infants.

The courage and ability shown by almost all the Stewart princes were insufficient to repair the mischiefs done by others in the beginning of their reigns, and to abate the great curse of the country—the unlimited power and constant feuds of the nobles. The last addition to the Scottish kingdom was made in the reign of James III., when the islands of Orkney and Zetland were made over to him as the dowry of his queen, Margaret of Denmark. The marriage of James IV. with Margaret of England was far more important in its ultimate results, and brought about in the reign of his great-grandson that peaceful union with England which the death of the Maiden of Norway had prevented in the 13th century. Many good laws were enacted during the reigns of the Jameses; but the wisdom of the Scottish legislature was more shown in framing them than the vigor of the government in enforcing them. Among the most important improvements of the period was the establishment of universities—the first of which, that of St. Andrews, was founded during the minority of James I. —and the institution of the College of Justice in the reign of James V.

During the reign of the fifth James, religious discord added another element to the evils with which Scotland was afflicted. The practical corruptions of the church were greater than they were almost in any other country in Europe, and one of the consequences was, that the principles of the Reformation were pushed further than elsewhere. Ths first great ecclesiastical struggle had hardly ceased, by the overthrow of the Roman Catholic system, when the strife began anew in the Reformed Communion in the shape of a contest between Episcopacy and Presbyterianism, the former being supported by the sovereign, the latter by the common people, the nobles throwing their weight into either scale as it suited their policy at the time. James VI. struggled hard to establish an absolute supremacy, both in church and state, in opposition to a powerful party, which admitted no royal authority whatever in the former, and very little in the latter. After his accession to the English crown, he was apparently successful in carrying out his designs, but during the reign of his son, Charles I., the contest again broke out with increased bitterness. The nobility, whose rapacity had been checked by the sovereign, joined the popular party. The opponents of the crown bound themselves together, first by the National Covenant, and afterwards in alliance with the English Puritans, by the Solemn League and Covenant. Their efforts were completely successful, but their success led to the utter overthrow of the monarchy by Cromwell.

The restoration of Charles II. was welcomed by all classes, wearied as they were of a foreign and military rule, but especially by the nobles and gentry, who had learned by bitter experience that the humiliation of the sovereign was necessarily followed by the degredation of their order. Had the government of Charles II. and James VII. been reasonably just and moderate, it could hardly have failed in securing general support; but unfortunately it was more oppressive and more corrupt than any which Scotland had experienced since the regencies in the minority of James VI. The natural result was the revolution, which seated William and Mary on the throne.

Hardly had the majority of the nation been successful in this, when many of them began to repent of what they had done, and Jacobitism became more popular than royalist principles had ever been when the House of Stewart was on the throne. The discontent was greatly increased by the fears entertained of English influence. The state of matters grew so threatening after the accession of Queen Anne, that the ruling English statesmen became satisfied that nothing short of an incorporating union between the two kingdoms could avert the danger of a disputed succession to the throne, and of a civil war. Supported by some of the ablest and most influential persons in Scotland, they were successful in carrying through their design, though it was opposed by a majority of the Scottish people. The Act of Union was formally ratified by the parliament of Scotland on the 16th of January 1707. It subsequently received the royal assent, and came into operatiou on the 1st of May of the same year. The union continued to be unpopular in Scotland for many years, an unpopularity increased by the corrupt means freely used to carry it through. But the discontent gradually ceased, and the ultimate consequences of the measure have been most beneficial to both kingdoms.

A few words may be added regarding the parliament of Scotland. That body was originally composed, like the English parliament, of three classes—the ecclesiastics (consisting of bishops, abbots, and priors), the barons, and the burgesses. The spiritual lords, during the establishment of Episcopacy after the Reformation, were composed of bishops only. When Presbyterianism was established at the time of the Covenant, and when it was formally ratified by law at the Revolution, the ecclesiastical estate ceased to have any place in parliament. The barons, or immediate vassals of the crown, at first sat in their own right, whether holding peerages or not; but afterwards the peers alone sat, the others sending their representatives. The burgesses were the representatives of the burghs. All the three estates sat to the very last in one house, the sovereign presiding in person, or through a commissioner named by him.

It would be impossible within reasonable limits to give a complete account of the original authorities for the history of Scotland. The principal ones are the following. For the period before the accession of David I.—Venerable Bede, the Early Lives of the Saints, the Irish Annals, the brief Scottish Chronicles published by Innes and Pinkerton, and the ancient English Chroniclers. For the subsequent period down to the Reformation—the Chronicles of Melrose and Lanercost, the Scotichronicon of Fordun and Bower, Winton's Chronicle, Leslie's and Buchanan's Histories, the English Chroniclers, the Ecclesiastical Chartularies, and the Acts of the Scottish Parliament. For the period from the Reformation to the Union—Knox's Calderwood's, and Spottiswood's Histories, Baillie's Letters, Wodrow's and Burnet's Histories, the Acts of Parliament, and the State Papers. The Scotch Record publications include *The Exchequer Rolls of S.; Accounts of Lord High Treasurer; Register of Privy Council; Documents illustrating Scotch History;* see also *Calendar of State Papers—Scotland*, 1509—1603. Modern works are Innes's *Critical Essay*, Pinkerton's *Inquiry*, Chalmers's *Caledonia*, Hailes's *Annals*, the histories of Robertson, Tytler, Laing, and Burton, Chambers's *Domestic Annals*, and Skene's *Celtic Scotland*.

SCOTLAND, CHURCH OF. For the Christianization of Scotland, see COLUMBA, CULDEES, NINIAN, PICTS, SCOTLAND. The doctrines of the ancient Scottish Church were the same as those of the rest of Western Christendom. In ritual, there were some points of difference, but so slight, that the most important related to the time of observing the Easter festival. In these, also, the Scots gradually conformed to the usage of the Roman and English Churches. In one point, however, there continued for several centuries to be a marked distinction between the Scots and Irish on one hand, and the churches of England and the continent on the other. This was in reference to ecclesiastical government. The Scots recognized the same orders of the ministry, bishops, priests, and deacons, as other Christians did; and, like them, they held that ordination could be given only by bishops. But they acknowledged no such supremacy of jurisdiction in the Episcopal order as was held by other churches. In Scotland, there were neither dioceses nor parishes; but there were numerous monasteries, in which the abbots, whether bishops or priests, bore the chief rule, all being in subordination to the successor of St. Co-

lumba, the presbyter-abbot of Iona, who, in virtue of that office, was primate of the Picts and Scots.

When Iona was desolated by the Northmen, the primacy seems to have been transferred in the middle of the 9th c. to the Abbots of Dunkeld, and about fifty years afterwards to the Bishops of St. Andrews, who became known as *Episcopi Scotorum*, the bishops of the Scots. Slowly at first, but gradually an assimilation to the English and continental practices began, a change rendered more easy by the Scottish dominion being extended over Lothian, in which the ecclesiastical system was the same as that of England. A great impulse was given in the same direction by the marriage of Malcolm III., king of the Scots, with Margaret, the sister of Edgar Atheling. The king and queen used their utmost efforts to introduce the English usages in ecclesiastical as in other matters; and Margaret herself held repeated conferences for that purpose with the chief Scottish ecclesiastics, at which her husband acted as interpreter. The principal points in which she attempted to bring about a reform were the commencement of the Lent fast, the superstitious infrequency of receiving the communion, and the lax observance of Sunday and of the Scriptural and canonical restrictions on marriage between relations.

The reform begun by Malcolm and Margaret was fully carried out by their youngest son, David I. These improvements were completed by his successors, and before the end of the 12th c. the ecclesiastical system of S. differed in no important point from that of the rest of Europe. Some Scottish writers have lamented the change, as being one from purity of belief and practice to superstition and immorality. This is undoubtedly a mistake. The Celtic Church had become very corrupt, and the clergy were inferior both in learning and morals to their brethren in the south. King David was a reformer in the best sense of the word, and it does not detract from the character of his reformation, that as time went on the Scottish Church became involved in those superstitions with which the rest of Christendom was overspread.

The ritual of the Scottish medieval church was almost the same as that of England, the Salisbury Missal and Breviary being the models of the Liturgies and Office Books used in Scotland The external system of the church—cathedral, parochial, and monastic—was also in almost every point identical. The chief monastic orders were the Benedictine, and its most important branches the Cluniac and Cistercian, the canons regular of St. Augustine, and the Reformnd Premonstratensian canons. The Cluniacs and Cistercians were in strict subordination to the mother-houses of their orders at Cluny and Citeaux.

In the 13th c. the Dominican, Franciscan, and Carmelite friars were introduced into Scotland. The chapters of all the Scottish cathedrals, except those of St. Andrews and Whithorn, were composed of secular canons—the chief dignitaries being a dean, archdeacon, chancellor, precentor, and treasurer. The prior and canons regular of the Augustinian monastery at St. Andrews formed the chapter of that see, and the prior and Premonstratensian canons of Whithorn formed the chapter of the cathedral of Galloway. There were twelve dioceses in the Scottish Church, to which Orkney was added on the transference of those islands to the Scottish sovereign in the 15th century. The twelve dioceses were Caithness, Ross, Moray, Aberdeen, Brechin, Dunkeld, Dunblane, St. Andrews, Argyle, the Isles, Glasgow, and Galloway. The larger of these dioceses were divided, like the English dioceses, into rural deaneries. The single point in which the medieval church down to the 15th c. differed from that of England and other churches of the west, was in its having no metropolitan. St. Andrews, and next to it Glasgow, had a certain precedence; the bishops of the former see, and failing them the bishops of the latter, having the privilege of crowning and anointing the sovereign. But they had no jurisdiction over the other sees, nor did their bishops bear the style of archbishop. This led to claims on the part of Archbishops of York to metropolitan authority in S., which had no foundation except in regard to the southern portion of the diocese of St. Andrews, and the see of Galloway, the bishops of which were, for several centuries, suffragans of York.

The court of Rome found it convenient, for the sake of its own privileges, to encourage this anomalous system; but to provide for the meetings of the Scottish bishops in provincial council, a bull of Pope Honorius III., in 1225, authorized them to meet in synod. In virtue of this bull, the bishops, abbots, priors, and other chief ecclesiastics, with representatives of the capitular, collegiate, and conventual bodies, assembled annually in provincial synod, sitting in one house, under the presidency of a conservator chosen by and from the bishops. The chief government of the church under the pope thus devolved on these synods, and their elective presidents. This continued until the erection of St. Andrews into an archiepiscopal and metropolitan see, in virtue of a bull of Pope Sixtus IV., in 1472. By this bull all the Scottish sees were made suffragans to that of St. Andrews, whose bishops were now to be styled archbishops.

In 1492 Glasgow was raised to the dignity of a metropolitan see by a bull of Pope Innocent VIII., and the Bishops of Dunkeld, Dunblane, Galloway, and Argyle were made suffragans to its archbishop, an arrangement which was soon afterwards altered to some extent—Dunkeld and Dunblane being reannexed to St. Andrews, and Glasgow having for its suffragan sees those of Galloway, Argyle, and the Isles. This last arrangement continued till the Reformation; and afterwards, during the establishment of Episcopacy—the two Scottish archbishops occupying towards each other precisely the same position as the Archbishops of Canterbury and York, and being sometimes involved in the same unseemly broils, in regard to jurisdiction and precedence, which long existed between the English metropolitans.

S. shared in all the errors of belief and superstitious practices in worship to which the rest of Christendom was subjected, and the ignorance and immorality of the clergy were far worse than they were in England, or perhaps anywhere in Europe, except in the Scandinavian churches. The desire for reformation which led to the proceedings of Huss and Wickliffe, produced similar effects in the Scottish kingdom. As early as the year 1406 or 1407, James Resby, an English priest, and a disciple of Wickliffe, was burned at Perth; and in 1433, Paul Crawar, a German Hussite, was burned at St. Andrews. The opinions of Wickliffe continued to be privately taught, particularly in the south-western counties, where his followers were known by the name of the Lollards of Kyle. In the following century, the intercourse with the continent was frequent and close, and the effects of Luther's preaching and writings were soon felt in Scotland. In the year 1525, the importation of Lutheran books, and the propagation of the Reformer's tenets, were forbidden by an act of the Scottish parliament; and in February 1528, Patrick Hamilton, abbot of Ferne, was burned at St. Andrews for teaching and publishing Lutheran doctrines. The piety of Hamilton, and the patience with which he bore his sufferings, induced others to follow his teachings and example. Several persons, both ecclesiastics and laymen, were subsequently burned, and many more fled to England or the continent.

The persecution, though encouraged or permitted by the bishops, was disapproved of by some ecclesiastics of learning and influence, who were desirous of effecting a reform in the church without breaking off from communion with the hierarchy. The efforts of this school were unsuccessful, and the Scottish nation was gradually divided into two parties—one of which, headed by the bishops, and supported by the state, was determined to resist all change; and the other, composed of a considerable number of the clergy both regular and secular, of the gentry, and of the burgesses of the large towns, was disposed to carry its reforming principles far beyond what had been done by Luther and Melancthon. These two parties came into deadly conflict in 1546. On the 28th February in that year, George Wishart, the most eloquent of the Reforming preachers, was condemned to death by an ecclesiastical court—at which Cardinal Beaton, Archbishop of St. Andrews, presided—and was burned. On the 28th of May following, the cardinal was murdered by Norman Leslie and other adherents of the Reforming party. The struggle continued during the regency of the Earl of Arran and that of Mary of Lorraine, the mother of Mary, the young queen of Scots.

In the year 1559 the Reformers became strong enough to set the regent at defiance. Various circumstances encouraged them to demand freedom for their opinions, particularly the death of Mary of England and the accession of Elizabeth. They were further animated at this time by the return from Geneva of their chief preacher, John Knox. The conflict was to be decided by other than spiritual weapons. The regent and the Reformed, now known by the name of the Congregation, met in open warfare. The contest was carried on for a twelvemonth, and ended in the triumph of the Congregation. A parliament met at Edinburgh on the 1st of August 1560. The Reforming party had the complete ascendency, and succeeded in passing several acts, by which the jurisdiction of the pope was abolished, the mass was proscribed, and a Confession of Faith, drawn up by Knox and his associates, was ratified, the spiritual lords making a faint resistance.

The new Confession of Faith adhered, in all essential articles of belief, to the ancient creeds of the church. In regard to the sacraments, it differed entirely from the recent corrupt teaching of the Western Church; but its language, on the whole, was moderate and conciliatory. In reference to ceremonies and the details of church polity, it declared that such things were temporary in their nature, and not appointed for all times and places, and that they ought to be altered when they fostered superstition and ceased to be conducive to edification.

A Book of Discipline was soon afterwards drawn up by the compilers of the Confession, which was generally approved of, but did not receive the sanction of parliament. It followed out in detail the principles laid down in the Confession. In regard to the office-bearers of the church various orders were mentioned, but three were specially of importance—ministers, elders, and deacons. Ministers were to be chosen by each several congrega-

tion, but were to be examined and admitted in public by the ministers and elders of the church. No other ceremony, such as imposition of hands, was to be used. The elders and deacons were to be chosen yearly in each congregation, and were not to receive any stipend, because their office was only to be from year to year, and because they were not to be debarred from attending to their own private occupations. In order to the better provision for the wants of the time, certain persons, called superintendents, were appointed in particular districts, with power to plant and erect churches, and to appoint ministers within the bounds of their jurisdiction.

The chief governing as well as legislative and judicial power in the Reformed Church was intrusted to a General Assembly, which met half yearly or yearly, and was composed of the superintendents, ministers, and lay commissioners, and which gradually, by the introduction of the system of representation, assumed the form and more than the power of a parliament.

The worship of the Reformed Church was modelled on that established by Calvin at Geneva. It was embodied in a formulary called the Book of Common Order, which for nearly a century continued to be generally used. It contained forms for the ordinary worship both on Sundays and week-days, and for the administration of the sacraments, and for certain other occasions. The minister was not absolutely restricted to these forms. Except in the singing of Psalms, the people took no direct part in ordinary worship, and there was no distinction of ecclesiastical seasons, all holydays whatever except Sunday being abolished.

The form of church government established at the Reformation did not remain long undisturbed. Some of the most zealous Protestants thought the danger to which the church was exposed from state tyranny and aristocratical oppression, could best be met by restoring the bishops to their ancient position both in the church and in the parliament; while others, of equal zeal and sincerity, saw in this only the commencement of a plan for bringing back all the errors of popery. A scheme of this kind was actually established for some time, and the sees were filled with Protestant bishops set apart for the office by their brethren of the ministry. It was almost immediately attacked by some of the ministers, who soon found a leader in Andrew Melville, a scholar of considerable eminence, who returned to Scotland in 1574, after a residence in Geneva, during which he had ardently embraced the new opinions as to ecclesiastical government maintained by Beza.

The struggle continued for some years, the bishops being encouraged by the sovereign and his advisers, whose support was frequently of little real advantage to them, and Melville receiving the zealous assistance of many of the ministers, and of the great body of the common people, who sympathized with him in his democratical theories of civil and ecclesiastical government. Melville was at last entirely successful. His opinions were embodied in what was called the Second Book of Discipline, which received the formal sanction of the General Assembly in 1581. This formulary differed very much from the First Book. It laid down authoritatively those principles in regard to ecclesiastical authority which the English Puritans were vainly striving to establish in the southern kingdom, and was in reality an attempt to make the civil power subordinate to the ecclesiastical, even in matters secular. It recognized four orders of office-bearers in the church, the Pastor, Minister, or Bishop, the Doctor, the Presbyter or Elder, and the Deacon. These were to be set apart by ordination, and the imposition of the hands of the eldership, but no one was to be intruded into any office contrary to the will of the congregation, or without the voice of the eldership. Four sorts of church courts, each rising above the other, were sanctioned; first, of particular congregations one or more; second, of a province, or what was afterwards called the Provincial Synod; third, of a whole nation; and fourth, of the universal church. What is generally regarded as the most essential feature of the Presbyterian system—the Presbytery—was not yet introduced in its proper form, the lowest court being a combination of what were afterwards known as the Presbytery and the Kirk-Session. It was, however, introduced before the year 1592, when the privileges of general and provincial assemblies, presbyteries, and parochial sessions were ratified by parliament, though the Book of Discipline itself did not receive any formal sanction.

King James had agreed to the establishment of Presbyterianism, but personally, and as a sovereign, he disliked its discipline, and he soon endeavored to overthrow it. His accession to the crown of England enabled him to do this with more authority. He gradually obtained from the General Assembly a recognition of the civil rights of the bishops, and this led to the restoration of their ecclesiastical privileges. His changes were sanctioned by a General Assembly which met at Glasgow in 1610, and in the course of the same year Episcopacy was restored in reality, as well as in name, by the consecration of three Scottish prelates, by four of the English bishops, at London.

The king wished to assimilate the Scottish Church, as far as possible, to that of England, and his next important movement was the establishment of what are called the Five Articles of Perth. See PERTH, THE FIVE ARTICLES OF.

These various changes excited great dissatisfaction in Scotland, particularly in the southern counties, but it gradually abated to a considerable extent, and might have altogether ceased, had not further innovations been attempted. It was the wish of James to introduce a prayer-book like that of the English Church, in place of the Book of Common Order, but he saw the danger with which the proposal was attended, and gave it up or postponed it. His son Charles was as inferior to his father in prudence, as he excelled him in conscientiousness and religious zeal. During his first visit to Scotland he added another bishopric—that of Edinburgh—to the dioceses of the Scottish Church. Most unwisely, and most improperly, he endeavored by his royal authority to introduce into that church a Book of Canons and a Liturgy framed on the model of those of England. The king had many loyal supporters in all parts of Scotland, and in the north Episcopacy was preferred by the people to Presbyterianism. But the storm of popular indignation which was now roused swept everything before it. The king's opponents banded themselves together by the National Covenant, and at a General Assembly held at Glasgow abolished the Perth Articles and Episcopacy, and re-established Presbyterianism. Charles attempted to maintain his claim by the sword, but was unsuccessful, and obliged to ratify in parliament all that had been done by his opponents.

Had the Covenanters been satisfied with the victory which they had won, Presbyterianism might have remained the established religion of the Scottish kingdom. But they could not resist the entreaties for aid from the English Puritans, or rather they yielded to the delusion of extending their own discipline over the churches of England and Ireland. They just attempted, in an opposite direction, what James and Charles had failed to accomplish. For a time their policy seemed to triumph. The Solemn League and Covenant of the three kingdoms, after having been approved by the General Assembly in Scotland, was signed by the Assembly of Divines which the parliament had summoned to meet at Westminster, and by the parliament itself. The ecclesiastical documents which were afterwards drawn up, originated with the Assembly of Divines, but were sanctioned by the Assembly in Scotland. The principal of these were a Directory for Public Worship, a Confession of Faith, and a Larger and Shorter Catechism. See ASSEMBLY OF DIVINES, and CREEDS AND CONFESSIONS. The first of these documents was intended to supersede the Book of Common Prayer in England, and, indirectly, the Book of Common Order in Scotland. It laid down certain general rules in regard to public worship and the administration of the sacraments, but left very much to the discretion of the particular ministers and congregations.

The union between the Scottish and English Puritans was dissolved by the ascendency of the Independents. Scotland, distracted by civil and ecclesiastical dissension, was unable to defend itself against Cromwell. It was conquered and kept thoroughly under subjection by the English army, which forbade the meetings of the General Assembly, but left the other courts and the rest of the church system as they were before. At the Restoration, the higher classes generally, who had suffered under the ecclesiastical tyranny of the ministers, were zealous for the re-establishment of Episcopacy. The greater part of the nation, except in the south-western provinces, was indifferent, and the king experienced no difficulty in restoring the bishops to their former rights both in church and state. But Episcopacy alone was restored; there was no attempt to introduce a liturgy, or even to enforce the observance of the Perth Articles. The new primate, Archbishop Sharp, was an able man of good moral character, but ambitious and overbearing, and the Covenanters never forgave his change from Presbyterianism, though he had always belonged to the more moderate of the two parties into which the church was divided. He was almost the only one of the bishops who enjoyed political influence; and unfortunately for himself and the hierarchy, that influence was generally used to encourage, not to restrain, the severe measures of the government. When the primate was assassinated, that severity became a cruel tyranny, and many who had no predilection for any particular ecclesiastical opinions were ready to welcome the change which took place at the Revolution.

When the Scottish Estates met in 1689, to consider what course was to be adopted in the northern kingdom, the bishops declined to abandon King James. Whatever might have been the consequences had they taken an opposite course, this resolution was fatal to the Episcopal establishment. William and Mary were called to the throne, and Prelacy was declared to be an insupportable grievance, and was abolished. In the following year, Presbyterianism was re-established, and the Westminster Confession of Faith was ratified as the national standard of belief, and the right of patrons to nominate to ecclesiastical benefices was taken away. In the end of the same year a General Assembly was held the first which had been allowed to meet since its dissolution by

the order of Cromwell. It was composed, as before, of ministers and elders from the various presbyteries, and of elders from the burghs and universities, and was presided over by a lay commissioner, named by the crown, and a minister elected by the members as moderator. With the exception of some years in the reign of William, the Assembly has continued to meet annually since the Revolution, and to transact business during the periods when it was not in session by a commission named by itself for the purpose. See ASSEMBLY, GENERAL. The other chief ecclesiastical events of William's reign were a series of vain attempts on the part of the sovereign to bring about a comprehension of the Episcopal clergy with those of the Establishment, and the passing by the Assembly in 1697 of what was called the 'Barrier Act' (q. v.), which guarded against sudden legislation, by providing that no permanent act should be passed until it had received the approbation of the majority of the presbyteries.

During the reign of Queen Anne, and in the year 1707, England and Scotland were united into one kingdom. A special statute was passed for the security of the Protestant religion and Presbyterian church government in the latter country; providing that these should continue without any alteration in time to come, and confirming the act of William and Mary, which ratified the Confession of Faith, and settled the Presbyterian form of church government.

In the year 1712, an act was passed by the British parliament which restored to patrons in Scotland their right of presentation to benefices. This statute excited great discontent among the members of the Established Church, and for many years attempts were made to obtain a repeal of it. These attempts were unsuccessful, but its provisions were long practically disregarded. When at length the General Assembly began to act upon it, the dissatisfaction increased among those who held the divine right of the people to choose their own ministers. The leader of the discontented party was a minister named Ebenezer Erskine, and he with his adherents, in the year 1733, finally separated from the Establishment, and formed a communion which took the title of the Associate Presbytery, though its members were popularly known as the Seceders. The Seceders themselves were soon divided by a very absurd dispute into two bodies, called the Burgher and Antiburgher Synods. In the year 1761, another secession from the Establishment took place in connection with the law of patronage; and the separated body assumed the name of the Presbytery of Relief.

There were no further secessions from the church; but its members were divided into two parties, known as the Moderates and the Evangelicals (q. v.), the former of whom were favorable, the latter hostile to the law of patronage. For many years the Moderates, headed by Dr. Robertson the historian and others of his school, and supported by the influence of the government, maintained an ascendency in the General Assembly and throughout the country. In the latter years of George III., and during the reign of George IV., this ascendency began to decrease. The political excitement which prevailed in the beginning of the reign of William IV. strongly affected the Scottish Establishment, which from its very constitution is peculiarly liable to be moved by the impulses of popular feeling. The two parties in the General Assembly engaged in a struggle more fierce than any in which they had yet met; and the subject of dispute, as before, was immediately connected with the law of patronage. Dr. Chalmers, the most distinguished minister in Scotland, added the whole weight of his influence to the popular party, and in 1834 an interim act of Assembly was passed, known as the Veto Act, which declared it to be a fundamental law of the church that no pastor should be intruded on any congregation contrary to the will of the people, and laid down certain rules for carrying out this principle. The legality of this act was doubted; and in connection with a presentation to the parish of Auchterarder, the presentee, on being rejected by the presbytery in terms of the Veto Act, appealed, with concurrence of the patron, to the Court of Session—the supreme civil court in Scotland. That court decided that the conduct of the presbytery in rejecting the presentee was illegal, and their judgment was affirmed by the House of Lords.

Other cases of a similar nature followed, and something like a conflict took place between the civil and ecclesiastical courts, the former enforcing their sentences by civil penalties, the latter suspending and deposing the ministers who obeyed the injunctions of the Court of Session. In the General Assembly of 1843 the dispute came to a crisis. A large number of ministers and elders of the popular party left the Assembly, and met apart in a similar body, of which Dr. Chalmers was chosen moderator. They formed themselves into a separate communion under the title of 'The Free Church of Scotland,' and gave up their benefices in the Established Church, and all connection whatever with that body. The Free Church carried off about one-half of the members of the Establishment, and became a rival communion in most of the parishes. See FREE CHURCH. By an act of parliament in 1874, patronage was abolished in the Established Church, and the right of choosing the minister transferred to the congregation. See PATRONAGE.

In 1820 the Burgher and Antiburgher Seceders were united under the name of the Associate Synod of the Secession Church; and in 1847 this Associate Synod and the Relief Synod were united under the name of 'The United Presbyterian Church' (q. v.). The recent negotiations for a union of the United Presbyterian Church and the Free Church have led to no practical result.

A few remarks may be added on the history of Scottish Episcopacy subsequently to the Revolution. It is a common but erroneous opinion that almost all the Episcopal clergy were Jacobites from the time of the accession of William and Mary. The bishops were so; but a large number, probably a considerable majority of the clergy, had at first no objection to take the oath of allegiance to the new government. During the reign of Queen Anne, the Episcopal clergy were well disposed to the government, knowing the queen's good wishes to their communion. They were frequently harassed by the courts of the Establishment; but all who were willing to take the oaths obtained an ample protection for their worship on the passing of the Toleration Act of 1712. On the death of the queen, almost all the clergy, and most of the laity, were involved directly or indirectly in the attempts to overthrow the Hanoverian dynasty, and it was this which finally made the names of Episcopalian and Jacobite for many years to be convertible terms.

In the meantime, the succession of bishops had been kept up by new consecrations, and after some years the dioceses, though diminished in number, were regularly filled. An important change took place in the forms of worship. No longer trammelled by their connection with the state, they adopted liturgical forms similar to those in the English Prayer-book, and in almost all cases identical, except that many of the congregations used an Office for the communion modelled on that of the Scottish Liturgy of King Charles I. The Episcopalians took no such open part in the insurrection of 1745 as they did in that of 1715, but their sympathies were known to be with the House of Stewart; and the government carried through parliament some intolerant acts, which were put in execution with great harshness, and which for many years suppressed all public worship in the Episcopal communion. It was only after the accession of George III. that these statutes ceased to be actively enforced; and it was not till 1792 that the Episcopalians, who from the death of Prince Charles had acknowledged the reigning dynasty, were relieved from the penal laws. The act which gave this relief imposed restrictions on their clergy officiating in England, and prohibited their holding benefices in the English Church. In 1804, the bishops and clergy agreed to adopt the Thirty-nine Articles of the Church of England, and in 1863, the Prayer-book was adopted as the authorized service-book of the Episcopal Church, permission being given in certain cases to use the Scottish Communion Office. The restrictions imposed on the Scottish clergy by the act of 1792 were modified by an act passed in 1840; and in 1864 they were entirely removed, the right being reserved to bishops in England and Ireland to refuse institution to a Scottish clergyman without assigning any reason, on his first presentation to a benefice in England or Ireland, but not after he should have once held such benefice.

The dioceses of the Scottish Episcopal Church are seven in number, viz., Moray, Aberdeen, Brechin, Argyle, St. Andrews, Edinburgh, and Glasgow. The bishops are chosen by the clergy of the diocese, and by representatives of the lay communicants, a majority of both orders being necessary to a valid election. One of the bishops, under the name of Primus, chosen by the other bishops, presides at all meetings of the bishops, and has certain other privileges, but possesses no metropolitan authority. The highest judicial body is the Episcopal College, composed of all the bishops. The highest legislative body is a General Synod, composed of two houses, the one of the bishops, the other of the deans and the representatives of the clergy.

The chief original authorities for the ecclesiastical history of Scotland down to the Revolution are the same as those mentioned in the article on the Civil History (q. v.) The chief modern authorities are: *Cook's History of the Reformation* and *History of the Church of Scotland;* Cunningham's *Church History of Scotland;* Grub's *Ecclesiastical History of Scotland.*

SCOTLAND, ROYAL ARMS OF. The arms of Scotland are—Or, a lion rampant gules, armed and langued azure, within a double tressure flory counterflory of fleurs-de-lis of the second. Supporters—Two unicorns argent armed maned and unguled or, gorged with open crowns, with chains affixed thereto, and reflexed over the back of the last. Crest—A lion sejant affronté gules crowned or, holding in the dexter paw a sword, and in the sinister a sceptre, both erect proper.

The lion is first seen on the seal of Alexander II., and the tressure on that of Alexander III. The unicorn supporters do not appear on any of the royal seals of Scotland till the time of

Queen Mary, on whose first Great Seal (1550) they are represented as chained and gorged with crowns. They, were, however, sculptured on Melrose Abbey as early as 1505.

Royal Arms of Scotland, previous to the Union.

In 1603, in consequence of the union of the crowns of England and Scotland, the Scottish arms came to be quartered with those of England and Ireland, while one of the English lions was adopted as a supporter. Precedence was, however, given within Scotland to the Scottish ensigns, which occupied the first and fourth quarters, and the unicorn also obtained the place of honor, being dexter supporter. From about the time of Charles I. to 1707, it became the practice to represent the unicorn as not merely gorged with an open crown, but crowned with an imperial crown. The Treaty of Union of 1707 declared (Art. 1) that the ensigns of the United Kingdom should be in future such as her majesty should appoint 'on all flags, banners, standards, and ensigns, both on sea and land;' the same mode of marshalling being adopted in England and Scotland. But Art. 24 has been sometimes supposed to leave room for a different mode of marshalling on the seals in use in matters relating exclusively to Scotland, and on the Great and other seals of Scotland. Since, as well as before the Union, precedence has been given to Scotland. The question of the proper marshalling of the royal arms within Scotland was raised in 1853 by a petition to the Queen by the magistrates of Brechin; a reference was made by the Home Office in the first instance to Garter King-at-Arms, and Garter's report was transmitted to the office of the Lord Lyon, where it was returned with observations by the Lyon Depute, who considered Scotland entitled to precedence on the judicial seals of the country; and his views have since continued to be acted on.

SCOTT, DAVID, a remarkable Scottish painter, was born in Edinburgh, October 10, or 12, 1806. He may be said to have commenced his career as an artist by an apprenticeship to his father, who was a landscape engraver; but endowed as he was with a deep, stern, sombre genius, it was soon visible to all who knew him that he was meant to be a painter. The first production that he ventured to send to the British Institution, 'Lot and his Daughters fleeing from the Cities of the Plain,' was returned as too large; but S. was too 'imperiously original' to take advice, and went on courageously painting pictures which, it has been said, 'would have required a hall for their exhibition, and which the public would neither admire nor buy.' In 1831, he exhibited the 'Monograms of Man,' a series of singularly suggestive sketches; and the first of his illustrations to Coleridge's *Ancient Mariner*, which are almost equal to the poem itself in weird and vivid beauty. In 1832, among others, 'Sarpedon carried by Sleep and Death,' a very fine work. In the autumn of the same year he set out for Rome, visiting most of the famous artistic cities on his way.

Nothing, however, that he saw in Italy or France, materially affected the bent of his genius, and his picture of 'Discord, or the Household Gods Destroyed,' painted there, exhibits all the peculiarities of his style and thought in a rampant and even repellent manner. In 1834 he returned to Edinburgh, and resumed his solitary brush. Passing over several interesting works, we may specially mention, as belonging to the year 1838, 'Ariel and Caliban,' and the 'Alchymist,' two of his best efforts in point of execution. Between 1840 and 1843, his chief productions were 'Philoctetes,' 'Queen Elizabeth in the Globe Theater,' 'The Duke of Gloucester taken into the Water-gate of Calais,' 'Silenus praising Wine,' 'Richard III.;' his illustrations (40 in number) of *The Pilgrim's Progress*, in which, as in those of *The Ancient Mariner*, he rivals the genius of the author he illustrates. In 1847, he produced the masterpiece of his whole career, 'Vasco da Gama encountering the Spirit of the Cape.' But S., always delicate, and even drooping in health, had now exhausted himself, and on the 5th of March 1849 he died, when fame was only beginning to encircle his name. S. contributed some vigorous essays on 'The Characteristics of the Great Masters' to *Blackwood's Magazine*. An unusually interesting *Memoir* by his brother, W. B. Scott, was published in 1850.

SCOTT, SIR MICHAEL, a medieval scholar and philosopher of the 13th c., whose real history is not only obscure but positively unknown. Boece identifies him with a Michael Scott of Balweary, in the parish of Kirkcaldy, in Fifeshire, who, along with Sir Michael de Wemyss, was sent to Norway in 1290, by the Scottish Estates, to bring home the 'Maiden of Norway,' and his death is fixed in the following year. But Sir Robert Sibbald, in his *History of Fife and Kinross* (published in the reign of Charles II.), speaks of a certain indenture, dated 1294, to which S.'s name was affixed, and in another part of the same book states that he went on a second embassy to Norway, in 1310, to demand the cession of the Orkneys. If we may rely upon Sir Robert's statement, it is hardly possible that the Scotch 'wizard' of European renown could have been the same person as Michael Scott of Balweary, because (as the story goes) after studying at Oxford or Paris, he went to the court of Frederic II., and wrote there some books at the request of that monarch. Now Frederic died in 1250, and supposing 'the wizard' not more than 30 years old at that time, this would make him 70 when he went to Norway the first time to bring home the 'Maiden,' and 90 on his second visit to demand the cession of the Orkneys; neither of which things is likely. Hector Boece, it should be observed, is our sole authority for the identification of Michael Scott of Balweary with the wizard, while, on the other hand, Dempster, in his *Historia Ecclesiastica Gentis Scotorum* (Bologna, 1627), distinctly avers that the name *Scotus*, borne by the latter, was that of his nation and not of his family —Michael, 'the Scot.'

It has been suggested that the ambassador may have been the son of the wizard, and that Boece may have confounded the two —a supposition probable enough in itself, but for which, in the absence of evidence, nothing can be said. The legend is further complicated by the fact that it appears to be English as well as Scottish. Cumberland claims the magic hero for herself. Camden, in his *Britannia* (1586), asserts that he was a monk of Ulme or Holme Cultram in that country, about 1290, 'who applied himself so closely to the mathematics, and other abstract parts of learning, that he was generally looked on as a conjuror; and a vain credulous humor has handed down I know not what miracles done by him.' He likewise states that S.'s 'magic books' were preserved there, but adds that they were then mouldering into dust; and Satchells (see his rhyming *History of the Right Honorable Name of Scott*) declares that he examined a huge tome which was held to be the wizard's, at Burgh-under-Bowness in 1629. According to the Scottish legend, he was buried in the Abbey of Melrose, and the Border was the scene of many of his most wonderful exploits, such as the cleaving of the Eildon Hills into three separate cones, and his bridling of the river Tweed! Dante mentions him in his *Inferno* (some years before 1321), in a way that shows that already his fame as a magician had spread over the continent, and suggests the suspicion that he must have died sooner than is commonly believed, All, however, that any one who rationally looks at the legend can believe, is, that a certain Michael Scott, or Michael the Scot, flourished in the 13th c., and was mistaken by the common people of his country for a wizard or magician, probably on account of his skill as an experimentalist in natural philosophy. The writings attributed to him indicate that his studies lay in this direction.

SCOTT, SIR WALTER, the fourth child of Walter Scott, Writer to the Signet in Edinburgh, was born in that city on the 15th August 1771. He came of the old Border family, the Scotts of Harden, an offshoot from the house of Buccleuch. Though he matured into a man of robust health, and of strength nearly herculean, as a child he was feeble and sickly, and very early he was smitten with a lameness which remained with him through life. His childhood was passed for the most part at Sandyknowe, the farm of his grandfather, in Roxburghshire. Here the foundations of his mind were laid; and his early and delighted familiarity with the ballads and legends then floating over all that part of the country, probably did more than any other influence to determine the sphere and modes of his future literary activity. Between the years 1779 and 1783 he attended the High School of Edinburgh, where, despite occasional flashes of talent, he shone

considerably more on the playground as a bold, high-spirited, and indomitable little fellow, with an odd turn for story-telling, than within he did as a student. In 1783, he went to the University, and for three years he remained there, as it seemed, not greatly to his advantage. Afterwards, in the height of his fame, he was wont to speak with deep regret of his neglect of his early opportunities. But though leaving college but scantily furnished with the knowledge formally taught there, in a desultory way of his own he had been hiving up stores of valuable, though unassorted information. From his earliest childhood onward, he was a ravenous and insatiable reader; his memory was of extraordinary range and tenacity, and of what he either read or observed he seems to have forgot almost nothing.

Of Latin, he knew little, of Greek less; but a serviceable, if somewhat inexact knowledge of French, Italian, Spanish, and German he had acquired, and he continued to retain. On the whole, for his special purposes, his education was perhaps as available as if he had been the pride of all his preceptors. In 1786, he was articled apprentice to his father, in whose office he worked as a clerk till 1792, in which year he was called to the bar In his profession he had fair success, and in 1797 he was married to Charlotte Margaret Carpenter, a lady of French birth and parentage. Towards the end of 1799, through the interest of his friends Lord Melville and the Duke of Buccleuch, he was made sheriff-depute of Selkirkshire, an appointment which brought him £300 a year, with not very much to do for it. Meantime, in a tentative and intermittent way, his leisure had been occupied with literature, which more and more distinctly announced itself as the main business of his life. His first publication, a translation of Bürger's ballads, *Lenore* and *The Wild Huntsman*, was issued in 1796. In 1798 appeared his translation of Goethe's drama of *Goetz von Berlichingen;* and in the year following he wrote the fine ballads, *Glenfinlas*, the *Eve of St. John*, and the *Grey Brother*. The year 1802 gave to the world the first two volumes of his *Border Minstrelsy*, which were followed in 1803 by a third and final one. This work, the fruit of those 'raids'—as he called them—over the Border counties, in which he had been wont to spend his vacations, was most favorably received by the public, and at once won for him a prominent place among the literary men of the time. In 1804, he issued an edition of the old poem *Sir Tristrem*, admirably edited and elucidated by valuable dissertations. Meantime, *The Lay of the Last Minstrel* had been in progress, and by its publication in 1805, S. became at a bound the most popular author of his day.

During the next ten years, besides a mass of miscellaneous work, the most important items of which were elaborate editions of Dryden (1808) and of Swift (1814), including in either case a Life, he gave to the world the poems *Marmion* (1808), *The Lady of the Lake* (1810), *The Vision of Don Roderick* (1811), *Rokeby* (1813), *The Bridal of Triermain*, anonymously published (1813), *The Lord of the Isles*, and *The Field of Waterloo*. The enthusiasm with which the earlier of these works were received somewhat began to abate as the series proceeded. The charm of novelty was no longer felt; moreover, a distinct deterioration in quality is not in the later poems to be denied; and in the bold outburst of Byron, with his deeper vein of sentiment and concentrated energy of passion, a formidable rival had appeared. All this S. distinctly noted, and after what he felt as the comparative failure of *The Lord of the Isles* in 1815, with the trivial exception of the anonymous piece *Harold the Dauntless* (1817), he published no more poetry. But already in *Waverley*, which appeared without his name in 1814, he had achieved the first of a new and more splendid series of triumphs. *Guy Mannering*, *The Antiquary*, *The Black Dwarf*, *Old Mortality*, *Rob Roy*, and *The Heart of Midlothian* rapidly followed, and the 'Great Unknown,' as he was called (whom yet every one could very well guess to be no other than Walter S.), became the idol of the hour. The rest of the famous series, known as the Waverley Novels, it would be idle to mention in detail.

From this time onward, for some years, S. stood on such a pinnacle of fame and brilliant social prosperity as no other British man of letters has ever gone near to reach. He resided chiefly at Abbotsford, the 'romance in stone' he had built himself in the Border country which he loved, and thither, as 'Pilgrims of his Genius,' summer after summer repaired crowds of the noble and the distinguished, to partake the princely hospitalities of a man whom they found as delightful in the easy intercourse of his home, as before they had found him in his writings. In 1820, to set a seal upon all this distinction, a baronetcy was bestowed upon him as a special mark of the royal favor. But the stately fabric of his fortunes, secure as it seemed, was in secret built upon the shifting sands of commercial speculation, and in the disastrous crisis of the year 1826 a huge ruin smote it. In 1805, S.'s income, as calculated by his biographer, was something nigh £1000 a year, irrespective of what literature might bring him; a handsome competency, shortly by his appointment to a clerkship of the Court of Session, to have an increment at first of £800, subsequently of £1300. But what was ample for all prosaic needs, seemed poor to his imagination with its fond and glittering dreams. Already some such vision, as at Abbotsford was afterwards realized, flitted before his mind's eye, and it was the darling ambition of his heart to re-create and leave behind him, in the founding of a family, some image of the olden glories which were the life of his literary inspirations. In the year above mentioned, lured by the prospect of profit, and without the knowledge of his friends, he joined James Ballantyne, an old schoolfellow, in the establishment of a large printing business in Edinburgh. To this, a few years afterwards, a publishing business was added, under the nominal conduct of John Ballantyne, a brother of James; S., in the new adventure, becoming as before a partner.

Gradually the affairs of the two firms became complicated with those of the great house of Constable & Co., in the sudden collapse of which S. found himself one forenoon a bankrupt, with personal liabilities to the extent of something like £150,000.

'In the reproof of chance
Lies the true proof of men'—

And now, in this challenge of adverse fate, S.'s manhood and proud integrity were most nobly approved. With his creditors, composition would have been easy; but this usual course he disdained. 'God granting him time and health,' he said, he would owe no man a penny. And somewhat declined as he now was from the first vigor and elasticity of his strength, he set himself by the labor of his pen to liquidate this enormous debt.

Breaking up his establishment at Abbotsford, where the wife whom he loved lay dying, he hired a lodging in Edinburgh, and there for some years, with stern and unfaltering resolution, he toiled at his prodigious task. The stream of novels flowed as formerly; a *History of Napoleon*, in eight volumes, was undertaken and completed, with much other miscellaneous work; and within the space of two years, S. had realized for his creditors the amazing sum of nearly £40,000. A new and annotated edition of the novels was issued with immense success, and there seemed every prospect that, within a reasonable period, S. might again front the world, as he had pledged himself to do, not owing to any man a penny. In this hope he toiled on; but the limits of endurance had been reached, and the springs of the outworn brain broke in that stress of cruel and long-continued effort. In 1830 he was smitten down with paralysis, from which he never thoroughly rallied. It was hoped that the climate of Italy might benefit him; and by the government of the day a frigate was placed at his disposal in which he proceeded thither. But in Italy he pined for the home to which he returned only to die. At Abbotsford, on the 21st September 1832, he died with his children round him and the murmur of the Tweed in his ears. On the 26th he was buried beside his wife in the old Abbey of Dryburgh.

In estimate of S. as an author, a few words must suffice. As regards his poetry, there is now little difference of opinion. Its merits, if somewhat superficial, are very genuine, and continue to secure for it some portion of the popular favor with which it was at first received. Deficient in certain of the higher and deeper qualities, and in those refinements of finish which we are of late accustomed to exact, it is admirable in its frank *abandon*, in its boldness and breadth of effect, its succession of clear pictures, its careless, rapid, easy narrative, unfailing life, spirit, vigorous and fiery movement. As a lyrist, S. specially excelled; and scattered hither and thither in his works are to be found little snatches of ballad and song scarcely surpassed in the language. The rank of S. as a writer of prose fiction, it is not so easy to fix with anything like precision. So imposing to the mind is his immense *prestige* as a novelist, that even at this date it is difficult to *criticise* him coolly; but it is not without risk of awakening some undermurmur of dissent, that the absolute supremacy can now be assigned him which at one time, almost without question, used to be conceded as his due. Nor is the dissent without some just ground of reason. S., with the artistic instinct granted him in largest measure, had little of the artistic conscience. Writing with the haste of the *improvisatore*, he could exercise over his work, as it proceeded, no jealous rigor of supervision; and on its appearance he was amply pleased with it if the public paid him handsomely. Hence he is an exceedingly irregular writer; many of his works are in structure most lax and careless, and some of the very greatest of them are disgraced by occasional infusions of obviously inferior matter.

Yet, all reasonable deductions made, it may be doubtful whether in mass and stature he is quite reached by any other novelist who could be mentioned. To class him, or even to speak of him along with Shakspeare, is absurd; but it is scarcely absurd perhaps to say that, *since* Shakspeare, to no British man has such wealth in this kind been intrusted. If, as we believe, the final test of greatness in this field be the power to vitalize character, to enrich our experience by imaginative contact with beings ever after more intimately distinct and real for us than the men we daily shake hands with, very few writers can be held to surpass

Scott. Further, he invented the historical novel, and in doing so, created a distinct literature, brought life into our conceptions of the past, and revolutionized our methods of writing history itself by a vivid infusion into them of picturesque and imaginative elements. On his *Scotch* novels his fame most securely rests; the others, for the most part, being obviously inferior. S.'s was essentially a great, sagacious, *practical* intelligence; on the speculative side he was entirely defective. See Lockhart's *Life of Sir Walter S.* (1837); and the *Life* by Hutton (1878).

SCOTT, WINFIELD, American general, was born at Petersburg, Virginia, of Scottish ancestry, January 13, 1786, was educated at William and Mary College, and studied the profession of law; but in 1808, having a genius for military pursuits, he was appointed captain of light artillery in General Wilkinson's division, stationed at Baton Rouge, Louisiana, but was suspended for having accused his general of complicity with the conspiracy of Aaron Burr. At the commencement of the war of 1812, he was appointed lieutenant-colonel, and sent to the Canadian frontier. He crossed with his regiment at Queenston Heights, where the American troops were at first successful; but on the British receiving reinforcements, they were repulsed with heavy loss, and S. was taken prisoner. The following year, having been exchanged, he was appointed adjutant-general, and was wounded by the explosion which followed the assault on Fort George. In 1814, as brigadier-general, he established a camp of instruction, and from April to July drilled his raw levies in the French tactics with such effect, that on the 3d of July he took Fort Erie, opposite Buffalo, by assault; and on the 5th fought a sharp drawn battle at Chippewa, and twenty days after, the famous frontier battle of Lundy's Lane, in which he had two horses killed under him, and was twice wounded, the last time severely. He was raised to the rank of major-general, and compiled the General Regulations of the Army, and translated and adapted from the French the system of Infantry Tactics, which has since been the text-book of the American army.

In the Indian hostilities of the American frontier, in the excitement attending the threat of Nullification in South Carolina, and in the Seminole war, General S. manifested those qualities of wisdom and moderation which made him rather a pacificator than a warrior. During the Canadian revolt of 1837—1838, he displayed great tact in allaying the excited passions of the frontier. In 1841 he was appointed commander-in-chief of the U. S. army, and in 1846 directed the military operations in the war against Mexico. Taking the field in person, he, March 9, 1847, landed 12,000 men at Vera Cruz, and invested and bombarded the city, which capitulated on the 26th. April 18th he carried the heights of Cerro Gordo, on the 19th he took Jalapa, on the 22d Perote, and on May 15th Puebla, where, owing to his heavy losses, chiefly by diseases incident to the climate, he was obliged to wait for reinforcements. On the 10th of August he advanced, with 10,780 men, to encounter the larger forces and strong positions of General Santa Anna. He turned El Penon, and won the brilliant victories of Contreras and Churubusco. Santa Anna entered upon negotiations only to gain time and strengthen his defences. These were followed by the sharp and sanguinary battles of Molino El Rey and Churubusco, September 8th, strong positions skilfully and bravely defended by superior numbers; and on the 14th S. entered the city of Mexico at the head of less than 8000 soldiers. Peace was negotiated with the cession of New Mexico and California to the United States, and the victorious general was welcomed home with the liveliest demonstrations. In 1852 General S. was the candidate of the Whig party for the presidency, but was defeated by one of his subordinate officers, General Franklin Pierce. In 1855, was created for him the office of lieutenant-general.

At the beginning of the war of Secession in 1861, he foresaw more than many others its extent and serious character, and advised the calling out of a much larger force than was first brought into the field. He had even suggested the advisability of allowing the 'wayward sisters to part in peace.' Age and growing infirmities compelled him in November 1861 to retire from active command. He subsequently visited Europe and published his *Memoirs* (8vo, 2 vols., New York, 1864.) S. died May 29, 1866.

SCOTTISH LANGUAGE AND LITERATURE. As the Scots were originally Irish Celts who settled in the Western Highlands of Alban, the phrase 'Scottish language' ought to denote, and did originally denote, *Ersch* or *Gaelic;* but the gradual extension of the authority of the Scottish kings, first over their Celtic neighbors the Picts, then over the Kymry or Cymry (q. v.) of Strathclyde, and the Angles of Lothian and the Merse, led to the name 'Scottish' being given to the language of the last of these; though, in reality, the true old 'Scottish'—i. e., the Gaelic, the speech of Kenneth MacAlpin and Malcolm Canmore, is further removed from the 'Scottish' of Ramsay and Burns (which is simply a dialect of northern English than the latter is from Russian or Sanscrit.

On this point Mr. Murray remarks in a scholarly paper, or rather treatise, in the *Transactions of the Philological Society for* 1873, which bids fair to become a standard authority on the subject: 'Ethnologically speaking, the Lowland Scotch dialects are forms of the Angle, or English, as spoken by those northern members of the Angle, or English race who became subjects of the king of the Scots. . . . More particularly they are forms of the North-umbrian or northern English—"the language of the Northin lede" which up to the war of independence was spoken as one language, from the Humber to the Forth, the Grampians, and the Moray Firth; but which, since the final renunciation of attempts upon the independence of the kingdom, has had a history and culture of its own, has been influenced by legal institutions, an ecclesiastical system, a foreign connection, and a national life, altogether distinct from those which have operated upon the same language on the southern side of the Border.'

Using then, the term 'Scottish' to denote the dialect of English used north of the Tweed, and omitting all consideration of anything written in Celtic, we may divide the history of *Scottish literature* into two periods; the first extending from the date of the earliest composition to the union of England and Scotland under one king, the second from that time to the present day.

A well-known brief lament for the death of Alexander III. preserved by Wyntoun, and marked by considerable beauty and pathos, is generally supposed to be one of the earliest specimens of Scottish poetry which has come down to us. The first Scottish *poet*—in the proper sense of the word—was John Barbour (q. v.), archdeacon of Aberdeen, who was born in the first half of the 14th c., and died in 1395. His great work is the poem of *The Brus*, in which he celebrates the struggles and final victory of King Robert Bruce. Barbour is superior to any English writer of the same century, except Chaucer and Langland. His language is even purer English than that used by the great author of the *Canterbury Tales*. There are editions of *The Brus* by Pinkerton, Jamieson, and Cosmo Innes (1856), from a MS. in the Advocates' Library; and by Rev. W. Skeat, from a MS. in St. John's College, Cambridge (1878).

The 15th c., during which England produced no poetical writer of eminence, was fertile in Scottish poets. First in rank, and hardly inferior to any in genius, was James I., king of Scotland, the author of *The Kingis Quhair*—i. e., The King's Quire or Book. Before him, in point of time, was Andrew Wyntoun, prior of Lochleven, who wrote a metrical chronicle, which was edited in part by Macpherson in 1795. A complete edition, by David Laing, was published 1872–78. Another Scottish poet of this century was Henry the Minstrel, or Blind Harry (q. v.), whose poem on the life of Wallace, in a modernized text, was long a favorite in Scotland.

The closing years of this century, and the first half of the next, were distinguished by poets of still higher name. Foremost of these is William Dunbar (q. v.), author of *The Thrissill and the Rois, The Goldyn Targe*, and many smaller poems, both serious and satirical, of very high merit. The only complete edition of his works is that by Mr. David Laing, which was published in 1834. Gawin Douglas (q. v.), a son of the Earl of Angus, and bishop of Dunkeld, was contemporary with Dunbar. He wrote several original poems, but his principal work is the translation in which he first gave 'rude Scotland Virgil's page.' A magnificent edition of Douglas has just been published under the editorship of Mr. Small (Edinburgh: Paterson, 1874). The last remarkable writer of this age is Sir David Lindsay (q. v.), who died in 1555, and whose poetical works were published in 1806 by George Chalmers, and again in 1871 by David Laing. The 16th c. also produced the first Scottish prose-writers. Among these is the anonymous author of *The Camplaynt of Scotland*, recently edited by Mr. Murray, from whom we have quoted above; and John Bellenden, archdeacon of Moray, the translator of Boece's *Scotorum Historiæ*, and of the first five books of Livy.

With Lindsay ceased that succession of poets writing in the Scottish dialect which had continued without interruption from the time of Barbour. It was more than a century and a half before another made his appearance. Most of the scholars of that time wrote in Latin; but for one vernacular prose-work of great merit as a composition, *The History of the Reformatioun of Religioun within the Realme of Scotland*, we are indebted to the leader of the movement, John Knox (q. v.).

We may close our account of this first period by the statement, that down to the period of the Reformation every Lowland Scot knew that his language was 'Inglis,' and the only one who did not speak of it as such was Gawin Douglas. The accession of King James to the crown of England was unpropitious to the vernacular literature of Scotland. The parliament still met at Edinburgh, but the capital had ceased to be the residence of a court, and the language began to be looked upon as a vulgar dialect of the English. The best authors composed in the classic English of the south. It was in that language Drummond (q. v.) of Hawthornden wrote his verses, Archbishop Spottiswood (q. v.)

and Bishop Burnet their histories, and Archbishop Leighton (q. v.) and Henry Scougal their theological works, so far as they were not in Latin.

It might have been expected that the union of the kingdoms, by which Scotland was deprived of a legislature of her own, would have soon extinguished the cultivation of the native literature; but as a matter of fact, it turned out to be otherwise. There was a strong popular prejudice against the Union, and this roused a deep feeling of nationality, apart from the old religious divisions. At this time appeared the first Scottish poet of true genius since the dark age of the country's literature set in—Allan Ramsay (q. v.), author of *The Gentle Shepherd*, which was published in 1725. Ramsay had also the merit of preserving some of those songs and ballads which have since become so famous, but whose authors are quite unknown. How far these works are the productions of an earlier age, and how far they are the composition of authors living in the 18th c., has been keenly discussed. Reference may be made to *The Romantic Scottish Ballads* of Mr. Robert Chambers on the one side, and to *The Lady Wardlaw Heresy* of Mr. Norval Clyne on the other.

To the deep attachment to the exiled line of kings cherished by a large party in Scotland, and to the interest awakened by the struggles in which this resulted, we owe the exquisite Jacobite songs.

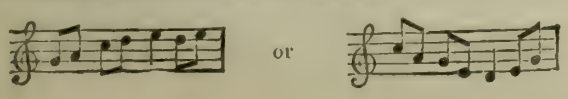
While these feelings were dying away under the influence of the mild government of George III., the close of the century was made famous by the appearance of the most illustrious of Scottish poets. It is almost needless to say a word of Robert Burns (q. v.). Admired by all ranks, he continues to be the chosen classic of the peasantry of the Scottish Lowlands. It is as an English writer that Sir Walter Scott (q. v.) is famous; but many of his lyrical pieces, and the dialogues in his novels, where the speakers use their own northern tongue, entitle him to be ranked as the last and greatest of Scottish writers.

There is, however, no doubt that in spite of the fine and various manifestation of literary genius in the Scottish dialect during the 18th and 19th centuries, that dialect has for the last 200 years been going through a process of uninterrupted decay. The introduction of southern English as the standard or classic form of speech after the union of the crowns, and still more after the union of the parliaments, slowly but surely ruined the old Anglian tongue of Scotland, till most of its peculiarities disappeared, and a jargon grew up that was neither pure English nor pure Scotch, but of which nevertheless Scotchmen are curiously proud. Mr. Murray has happily characterized this jargon in which Ramsay, Fergusson, Burns, Scott, Hogg, and Tannahill, wrote as '*fancy* Scotch.'

See Craik's *History of English Literature and the English Language* (1864); David Irving's *History of Scottish Poetry* (Edin. 1861); Cosmo Innes' preface to his edition of Barbour's *Brus* (1856); and Murray's Essay in the *Transactions of the Philological Society* (1873).

SCOTTISH MUSIC. Scotland is famed for a class of national airs of a peculiar style and structure, possessing a wild, dignified, strongly marked, and expressive character. They are generally considered to be of great antiquity; the few notes on which the oldest of them turn, and the character of the modulation, lead to the inference, that they originated at a time when the musical scale and musical instruments of the country were in a rude state; but there is a deficiency of evidence regarding their early history. No musical MS. of Scottish airs is now known to exist of an older date than 1627; and we have no knowledge when and by whom the early Scottish melodies were composed, or how long they continued to be handed down traditionally from generation to generation. They may not improbably have been committed to notation in the 15th and 16th centuries; and their disappearance is not wonderful, when we take into account, first, the strong measures resorted to, about 1530, by both civil and ecclesiastical authorities, to put down all ballads reflecting on the Roman Catholic hierarchy, and afterwards the ill-will shown by the now dominant Presbyterians towards worldly amusements, including not a few that were entirely innocent. The most valuable of now existing early collections of Scotch melodies is the Skene MS., in the Advocates' Library, noted down by Sir John Skene of Hallyards about the year 1630. It contains a number of native airs, mixed with some foreign dance-tunes—upwards of a hundred in all. Many of the Scotch melodies differ considerably from the more modern versions, presenting in general a ruder outline; but often exhibiting beauties which the changes these airs have subsequently undergone have only tended to destroy.

Among the peculiarities which give its character to the music of Scotland, the most prominent is the prevalent omission of the fourth and seventh of the scale, and consequent absence of semitones, giving rise to such melodic forms as



Passages of this kind occur in all the airs of Scotland which have any claim to popularity, and form one of their most recognizable features. Another characteristic is the substitution of the descending for the ascending sixth and seventh in the minor scale, as at the beginning of the air called *Adew, Dundee*, in the Skene MS.—

A very prevalent course of modulation is an alternation between the major key and its relative minor, the melody thus ever keeping true to the diatonic scale of the principal key, without the introduction of accidentals. An air will often begin in the major key, and end in the relative minor, or the reverse. The closing note is by no means necessarily the key-note, a peculiarity especially remarkable in the Highland airs, which, if in a major key, most frequently terminate in the second; if in a minor, on the seventh. Closes are also to be found on the third, fifth, and sixth. The peculiarities of modulation of the music of Scotland have something in common with the modes of ancient ecclesiastical music, to which it may be more correctly said to belong, than to the modern major and minor keys; and the avoidance of the fourth and seventh may have originated in the imperfection of the ancient wind instruments; yet these peculiarities are not to be found in the national airs of other countries where ecclesiastical music may be supposed to have had the same influence, and the early instruments to have been equally imperfect.

Among the more modern printed collections of Scottish melodies with words, the most important are George Thomson's collection, with symphonies and accompaniments by Pleyel, Kozeluch, Haydn, Beethoven, Hummel, and Weber (vols. i.—iv., 1793—1805; vol. v. 1826; and vol. vi. 1841), one distinguishing feature of which was the appearance of Burns's words conjoined with the old melodies of the country; and a more recent collection in 3 vols., published by Messrs. Wood & Co., and edited with historical, biographical, and critical notes by Mr. G. F. Graham (1848—1849).

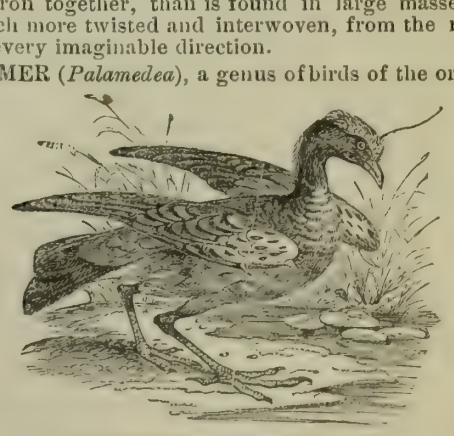
On the subject of Scottish music generally reference is made to Dauney's *Ancient Scottish Melodies, with Introductory Inquiry* (Edin. 1838).

SCOTUS AND SCOTISTS. See DUNS SCOTUS.

SCRANTON, a city of Pennsylvania, U. S., 105 m. N.-by-W. of Philadelphia. It lies in an important anthracite basin, and is the center of five railways. Its trade in coal and mining supplies is enormous. It became a city in 1866. Pop. (1870) 35,092; (1880) 45,850.

SCRAP-METAL, a term applied to fragments of any kind of metal which are only of use for remelting. Copper and brass scrap consist of the turnings from the lathe, and all useless and worn pieces, whether old or new. They are readily remelted. Scrap-tin consists of the clippings and fragments of tinned iron and worn-out tinned vessels; these are frequently dipped into hydrochloric acid, to dissolve off the tin-coating from the iron; and the muriate of tin so formed is of commercial value for dyeing purposes. Scrap-iron consists of any waste pieces of iron, although the term is usually held to mean malleable iron only; and for many purposes it is particularly valuable, as it is found that a greater strength can be obtained by welding small fragments of iron together, than is found in large masses, the fibre being much more twisted and interwoven, from the mingling of pieces in every imaginable direction.

SCREAMER (*Palamedea*), a genus of birds of the order *Grallæ*,



Horned Screamer (*Palamedea cornuta*).

allied to the Jacanas (q. v.). The bill is rather short, conical, curved at the extremity; there is a bare space around the eyes; the toes are long; each wing is furnished with two strong spurs. The HORNED S., or KAMICHI (*P. cornuta*), inhabits swamps in Brazil and Guiana, and feeds on the leaves and seeds of aquatic

plants. It is of a blackish-brown color, nearly as large as a turkey, and has somewhat the appearance of a gallinaceous bird. It receives its name from its loud and harsh cry. From the head, a little behind the bill, there rises a long, slender, movable horn, of which no use has been conjectured. The spurs of the wings are supposed to be useful in defence against snakes and other enemies.—Closely allied to this genus is the genus *Chauna*, or *Opistolophus*, to which belongs the CHAUNA, or CRESTED S. (*C.* or *O. chavaria*), a native of Brazil and Paraguay, the head of which has no horn, but is adorned with erectile feathers. The plumage is mostly lead-colored and blackish. The wings are armed with spurs. It is very capable of domestication, and is sometimes reared with flocks of geese and turkeys, to defend them from vultures, being a bold and powerful bird.

SCREEN, in Architecture, an enclosure or partition of wood, stone, or metal work. It is of frequent use in churches, where it shuts off chapels from the nave, separates the nave from the choir, and frequently encloses the choir all round. Such screens are often much ornamented, the lower part being solid, and the upper very often perforated. The Rood-screen (see ROOD) is that on which most labor is usually bestowed. In England, many beautifully carved screens in stone, enriched with pinnacles, niches, statues, &c., remain, such as those of York, Lincoln, Durham, &c.; and specimens in wood, carved and painted, are common in parish churches. In France, the screen round the choir is sometimes the subject of beautiful sculptures, as at Amiens and Paris. In Halls (q. v.) there was usually a wooden screen at one end to separate the entrance-door and a passage from the hall. Over this was a gallery. The term 'Screen of Columns' is also applied to an open detached colonnade.

SCREW, one of the Mechanical Powers (q. v.), is a modification of the Inclined Plane (q. v.), as may be shown (fig. 1) by

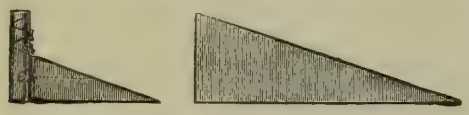


Fig. 1.

wrapping a piece of paper in the form of an inclined plane round a cylinder. In the screw, the spiral line, formed by the length or slope of the plane, is raised up in a ridge, and a lever is attached for the purpose of working it, so that the screw is really a compound machine, combining the lever and the inclined plane. It may be used as an instrument for penetration, as in the auger, gimlet, &c., or as a means of producing pressure, the latter being its most important application as a mechanical power. For this purpose, it is made to work in a 'female screw' or *nut* (a hollow cylinder grooved on the inside, so as to correspond to the threads of the screw); the nut is then firmly fixed in a massive frame (fig. 2), and the revolution within it of the screw causes the lower extremity of the latter to advance or recede. The principle of the screw's application is the same as that of an inclined plane pushed further and further under a heavy body so as to raise it up. Now in the inclined plane, P, the power or force, is to W, the weight raised or the pressure overcome, as the height of the plane to its base; that is, in the screw, as the distance between two threads is to the circumference of the cylinder. But as the twist is not applied at the circumference of the cylinder directly, but by means of a lever, it follows that the power applied, P, is to W, as the distance of two threads to the circumference described by P at the end of the lever.

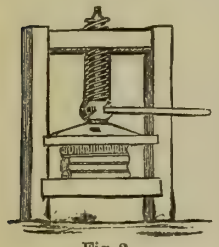

Fig. 2.

We see, then, that the power of the screw is increased by diminishing the distance between the threads; but as this cannot be effected without weakening the instrument, there is an evident limit to the increase of power in this way. The power can also be increased by lengthening the lever; but the best mode is that proposed by Mr. Hunter (in the *Phil. Trans.* vol. 17), in which are employed two screws of different fineness, the coarser of them hollow and grooved, to act as a nut for the other. The outer and coarser screw is the one to which the power is applied by a lever, and it is adjusted in the manner before described; the inner is so fastened as to be capable of vertical motion only. When the outer screw is turned so as to move its extremity downwards, the inner screw moves upwards, but not to the same amount; thus, if the outer screw have 6 threads to the inch, and the inner one 7, one turn of the outer screw depresses it $\frac{1}{7}$th of an inch, but as the inner one rises $\frac{1}{6}$th of an inch, the whole descent of the point which produces pressure is only $\frac{1}{6} - \frac{1}{7}$, or $\frac{1}{42}$ of an inch; hence the pressure applied is 7 times greater than could be given by the outer, 6 times greater than could be given by the inner screw, and equal to what would be given by a screw with 42 threads to the inch, with the same power applied. The advantage of Hunter's screw is that the threads may be any thickness, and consequently each screw any strength, we please, provided the difference be small enough. The screw is one of the most powerful of mechanical powers, but the friction generated by it amounts to about $\frac{1}{3}$d of the force applied.

SCREW-DRIVER, a chisel-shaped tool, used for turning round, and so driving in or drawing out the common joiners' screw-nails, the heads of which have a cleft made to receive the edge of the screw-driver.

SCREW PINE (*Pandanus*), a genus of plants of the natural order *Pandanaceæ*, natives of the tropical parts of the east and of the South Sea Islands. Many of them are remarkable for their adventitious roots, with large cup-like *spongioles*, which their branches send down to the ground, and which serve as props. Their leaves are sword-shaped, with spiny edges, and are spirally arranged in three rows. In general appearance, when unbranched, they resemble gigantic plants of the pine-apple, whence their popular name. *P. odoratissimus* is a widely diffused species; a spreading and branching tree of 25 feet high, much used in India for hedges, although it takes up much ground. In the south of India, it is called the Kaldera Bush. It grows readily in a poor soil, and is one of the first plants to appear on newly-formed islands in the Pacific. The male flowers are in long spikes, the female flowers in shorter branches. The flowers are frequently gathered before expanding, and boiled with meat. Their delightful and very powerful fragrance has made the plant a favorite everywhere, and it is the subject of continual allusions in Sanscrit poetry, under the name *Ketaka*.

Oil impregnated with the odor of the flowers, and the distilled water of them, are highly esteemed East Indian perfumes. The seeds are eatable; and the fleshy part of the drupes, which grow together in large heads, is eaten in times of scarcity, as is the soft white base of the leaves. The terminal buds are eaten, like those of palms. The spongy and juicy branches are cut into small pieces as food for cattle. The leaves are used for thatching, and for making a kind of umbrella common in India, and their tough longitudinal fibres for making mats and cordage. The roots are spindle-shaped, and are composed of tough fibres; they are therefore split up by basket-makers, and used for tying their work.—More valuable, however, as a fibrous plant is an allied species, *P. sativus* or *P. Vacoa*, the VACOA of Mauritius, which, if permitted, grows to a height of about 30 feet, but from continual cropping of its leaves, is usually dwarfed to six or ten feet. The fibres of its leaves are used for making the *Vacoa bags*, which constitute so considerable an article of export from Mauritius, rivalling in cheapness and usefulness the Gunny Bags of India. The leaves are cut every second year, and each plant yields enough to make two large bags. Immediately on being cut off, the leaves are split into fillets, which are nearly an inch broad at the base, but taper to a point, and are three or four feet long. One of these will support a bag of sugar, of about 140 pounds, without breaking. The aërial roots of the Vacoa are so fibrous as to be used for making paint-brushes for coarse purposes.

SCREW-PROPELLER, THE, is of the same construction as the common Screw (q. v.), but with the narrow thread exaggerated into a broad, thin plate, and the cylinder diminished to a mere spindle. One complete turn of such a screw is shown in fig. 1. Now, if a screw of this form were turned round in an unyielding substance, as wood, it would for each turn advance as much as the center of the blade (or thread) had moved along the spindle in forming the screw, i. e., the distance *ab*. If, on the other hand, the screw itself were prevented from moving longitudinally, and the piece of wood *not* fixed, the latter would be compelled to advance along the screw the same distance *ab*. When the screw is fixed beneath a ship, and made to revolve in the water, the case lies between the two just supposed, the screw moves forward, and with it the ship, and the water in which it has been working

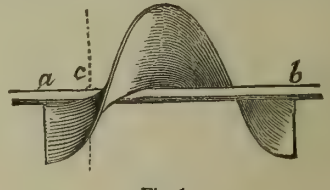

Fig. 1.

moves backward. The backward motion should only be small proportionately, and the ratio between it and the sum of the backward motion of the water and the forward motion of the ship is called the *slip*, which in well-designed vessels has a value of from 0·1 to 0·25

It is obvious also that on the same spindle there may be more than one blade, provided that all the blades have the same pitch or rate of progression along the spindle (in fig. 1, *ab* is the *pitch* of the screw). Screws have thus been formed with two, three, four, and six blades or arms, but the form most commonly used is two blades for ships-of-war, and three or four blades in the merchant-service.

If the screw be cut off before attaining the length *ab* of a whole convolution, as at *c*, the portion *ac* will still retain all the properties of the screw. In the earlier attempts, screws were tried of the length of a whole convolution, or even two whole turns; but experiment has since shown that this length is a disadvantage. The best results are obtained when the sum of the lengths, measured parallel to the center line of the shaft, of all the blades, is equal to about 0·4 of the pitch. This holds equally good for two, three, or four-bladed propellers, so that if n equals the number of blades, then the length of one blade, or *ac*, would be expressed by the equation $ac = \frac{0{\cdot}4\ ab}{n}$. A four-bladed screw of this kind, and of a form very generally used in the merchant navy, is shown in fig. 2.

The following are the technical terms applied to the screw-propeller: The *shaft* is the cylindrical axis on which the screw revolves, and is the medium for communicating to it the power of the steam-engine; the *blade* is the thread of the screw; the *pitch*,

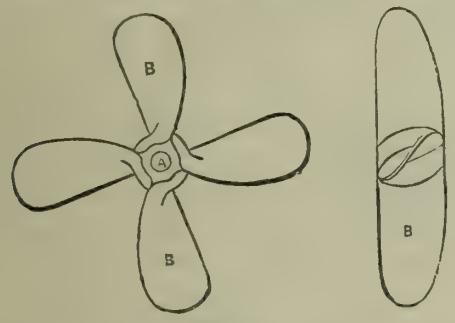

Fig. 2

the length of shaft on which the blade would make one complete turn; the *diameter* is the distance between the tips of opposite blades; and the *length* is the distance from the front to the back edge of blade projected upon a fore and aft plane.

The application of the screw to the propulsion of a vessel through the water is not new. In 1802, Dr. Shorter, an English mechanician, produced motion by its agency; but his discovery was valueless, as the steam-engine had not then been practically applied to navigation. Those who first employed Watt's engine on board ship adopted the paddle-wheel, the success of which turned attention from the screw for nearly thirty years. At length, in 1832, Mr. B. Woodcroft patented a screw-propeller with an increasing pitch; and four years later, Mr. F. P. Smith patented a screw making two whole turns, which he reduced, in 1839, to one whole turn. In 1837, he and Captain Ericsson, an American inventor, brought the matter practically forward on the Thames, where a small screw steamer, 45 feet long, 8 feet broad, and of 27 inches draught, towed the *Toronto* of 650 tons against tide at 4¼ knots an hour. In 1839, an American gentleman had the *Robert Stockton* built for him by Messrs. Laird, with which he reached America. The British Admiralty, however, refused any support to the new propeller, until the success of the *Archimedes*, built in 1838, of 232 tons and 80 horse-power, which was exhibited at the principal ports, rendered opposition no longer possible. The Admiralty, then, as an experiment, constructed the *Rattler*, from the trials of which vessel many valuable data for the screw-propeller have been derived. Meanwhile, in 1838, Mr. James Lowe had shown that the length of the screw should not exceed ⅓th of the pitch; and after actual and successive trials, the screw of the *Rattler* was cut down from 5 feet 9 inches to 1 foot 3 inches. These experiments established the screw as a rival to the paddle-wheel; and its advantage for ships of war became incontestible, as, from the entire submergence of the propeller, and consequent lowness of its engines in the ship, the chances of injury from an enemy's shot were reduced almost to nothing.

Some of the great steam-companies—notably the Peninsular and Oriental Company—also patronized it, and it was found of great value as an auxiliary in sailing-vessels. The result is that, at this time, its use in the British navy is almost universal, except in cases where want of sufficient depth of water, or other special circumstance, causes the paddle-wheel still to be employed.

Several varieties of screw have been introduced, each finding many supporters. The one which was for many years used in the British navy was invented by Mr. R. Griffiths. In it the blades, in place of rising from a small *boss*, as in fig. 2, spring from a hollow sphere occupying one-third the screw's diameter. This arrangement was adopted because experiment proved that the central portions of the blades of the ordinary screw absorb about 20 per cent. of the propelling power, while they produce little useful effect from the circumstance that at that part (especially in screws of a coarse pitch) the blade is nearly in a line with the shaft, and acts at right angles on the water, causing only a disturbance of that portion on which the outer and more powerful end of the blade operates. The globe, on the other hand, revolves with little friction. A further improvement was effected by bending the tips of the blades a little over backwards, so that the face of the blade striking the water was partly convex.

The older propellers had blades which increased in width uniformly from boss to tip. These were found to create much vibration in the ship, and the 'leading' corner is therefore rounded away as shown in fig. 2. This is also done in Griffith's propeller, but he probably carries the principle to excess in cutting away also the 'following' corner, and so lessening the effective surface of the blade. A propeller invented by Mr. Hirsch, and known by his name, has been lately successfully tried by the Admiralty, and may probably be much used by them in future.

One difficulty in the use of the screw as an auxiliary in sailing-ships is that in a good wind the screw seriously impedes the sailing. To prevent this, various devices are resorted to. In some cases, the screw is disconnected from the shaft, and left to revolve freely; in others, as in most ships of war, it is disconnected and hoisted altogether out of the water by means of an iron framework worked above the screw in a sort of well. Messrs. Maudslay have patented a 'feathering-screw,' which, by a simple apparatus, can, when the steam-power is not required, have the blades turned into a line with the ship's keel, and the screw (which must be two-bladed) fastened in a vertical position. When thus treated, the screw is out of danger, and forms no impediment to the ship's progress.

The usual position for the screw is immediately before the stern-post, the shaft on which it revolves passing, parallel to the keel, into the engine-room. Many vessels have been built, especially by Messrs. J. & W. Dudgeon of London, with two screws, one under each quarter. These have independent action, and as one can therefore be reversed, while the other goes ahead, great steering-power is imparted; so much so, that vessels constructed on this principle are said to be able to turn in their own length. For a given power, a twin-screw vessel draws less water, owing to the lessened diameter of the propellers, than an ordinary screw-steamer. As the action of the screw depends on the comparative immobility of the water in which it acts, it is necessary, for the development of its full power, that it should be completely immersed, and that there should be nearly two feet of water above the top of the upper blade. It follows from this that, *ceteris paribus*, the screw-vessel will draw more water than the paddle-steamer, for in large steamers the screw is from 15 to 18 feet in diameter, and in the *Great Eastern* it reaches 24.

It now only remains to notice the comparative advantage of the paddle and screw. Under favorable circumstances, in ships of equal tonnage and power, there is little difference in speed or force. Before the wind, the paddle has a slight advantage; with the wind ahead, the resistance offered by the paddle-boxes transfers the advantage to the screw. Fastened stern to stern, the screw-ship drags the paddle-ship; but fastened bow to bow, the same result is not found. This is, however, rather to be attributed to the loss of power in a paddle-ship when not in progress (see PADDLE WHEEL), than to any actual superiority of screw. In a long voyage, however, the gain is distinctly with the screw; because the weight of fuel borne at starting sinks the paddles too low in the water, and probably its exhaustion at the end of the voyage deprives them of their proper dip; whereas, with ordinary management, the screw will always be immersed. Again, rolling deprives the paddle of much power; while pitching deprives the screw of its proper matrix; but the balance of loss in tempestuous weather is in favor of the screw. It has been already shown that in men-of-war the screw is the most useful agent; and as an additional reason may be adduced the clear broadside which it allows for the guns. On the other hand, in point of comfort to the passengers, the advantage lies unquestionably with the paddle; for the rapid revolution of the heavy screw on a shaft extending half the ship's length, produces a continuous and very unpleasant vibration; while the lower position of the engines and screw gives the vessel a deep roll. For lakes and rivers, where the water is smooth and the voyage short, paddles are best, and more especially so when the water becomes often shallow or is choked with weeds, which would soon clog the screw.

In scientific language the motion of a vessel by means of a screw, is said to be due to the forward reaction of the water in which the propeller revolves upon the blades, and through them upon the whole vessel. In order that this useful reaction may bear the largest possible ratio to the work done by the engine, it is essential that the form of the ship aft should be such as will secure that plenty of water shall always have access to the forward side of the screw as the vessel goes along. This has been demonstrated by the experimental alterations in the after-body of the *Dwarf* (1846), and still more strikingly by placing a disc of the same diameter as the propeller in front of it. If the propeller be worked in these circumstances, the vessel will not move forward at all, although the power given out by the engines remains as before.

SCREW-WRENCH, a tool used for grasping the flat sides of the heads of large screws, such as are used in engines and other

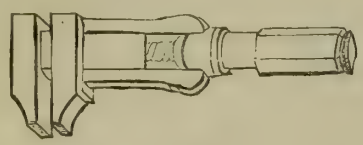

Fig. 1.

large works. The heads are usually octagonal laterally, and the wrench is made of two portions like hammers sliding one upon the other (fig. 1), so that screw-heads can be grasped of different sizes, and the handle forms the lever by which they are turned

Fig. 2.

round. The screw-key (fig. 2) is only a more simple kind of wrench, which will only act upon screws of two sizes, fitting the jaws at each end.

SCRI'BBLER. See SPINNING.

SCRIBE, AUGUSTIN EUGENE, a French dramatic writer, son of a wealthy silkmercer of Paris, was born in 1791. Educated for the legal profession, he soon deserted it for dramatic authorship. His first piece, *Les Dervis*, written by him in conjunction with Germain Delavigne (brother of Casimir Delavigne), was played in 1811, but till 1816 he cannot be said to have achieved a decided success. Since that time, pieces, chiefly vaudevilles, from his pen have followed each other with the most astonishing rapidity; and in such demand were they at the hand of theatrical managers, that S. established a sort of dramatic manufactory, in which numerous *collaborateurs* were constantly at work under his supervision. His plots are interesting, and his dialogue light and sparkling; and not a few of his pieces have been adapted for the English stage. S. also wrote various novels, and composed the *libretti* for a considerable number of well-known operas, including *Masaniello*, *Fra Diavolo*, *Rebert le Diable*, and *Les Huguenots*. He was admitted a member of the French Academy in 1834, and died February 20, 1861.

SCRIBE (Heb. *Sofer;* Gr. *Grammateus*, *Nomodidaskalos*), among the Jews, originally a kind of military officer, whose business appears to have been the recruiting and organizing of troops, the levying of war-taxes, and the like. At a later period, especially at the time of Christ, it had come to designate a learned man, a doctor of the law. Christ himself recognizes them as a legal authority (Matth. xxiii. 2); they were the preservers of traditions, and form a kind of police in the Temple and synagogues, together with the high-priests; and the people reverenced them, or were expected to reverence them, in an eminent degree. They were to be found all over the country of Palestine, and occupied the rank and profession of both lawyers and theologians. Their public field of action was thus probably threefold: they were either assessors of the Sanhedrim, or public teachers, or administrators and lawyers. Many of these teachers had special classrooms somewhere in the Temple of Jerusalem, where the pupils destined to the calling of a Rabbi sat at their feet. The calling of a Scribe being gratuitous, it was incumbent upon every one of them to learn and to exercise some trade. Those Scribes who were not eminent enough to rise to the higher branches of their profession, to enter the Sanhedrim, to be practical lawyers, or to hold schools of their own, occupied themselves in copying the Book of the Law or the Prophets, in writing phylacteries, contracts, letters of divorce, and the like. Their social position was naturally in accordance with their talents and their importance. The apostles, not learned enough, for the most part, to be Scribes, are promised to become 'Scribes' of the kingdom of God, &c. See PHARISEES, HALACHA, HAGGADA, MIDRASH, MISHNA, TALMUD.

SCRIBING, in Joinery, fitting the ends of pieces of wood together, so that the fibers may be at right angles, and the end cut away across the fibers.

SCRIP is a certificate (usually about the size and appearance of a bank-note) of a person's share or shares in a joint-stock undertaking. It is issued on the party signing a contract of copartnery, and is retained by him until an act of the legislature, or some other formality, establishes the company, and authorizes the opening of regular books for entering the names of shareholders and the transfer of stock. In many instances, scrip is unauthorizedly sold, and made an object of speculation; the party to whom it was assigned, however, remains bound by the contract which he has subscribed, until relieved of his obligations by transfer in the company's books.

SCRO'FULA, or SCROPHULA, was, until the last quarter of a century, regarded as consisting essentially of indolent glandular tumors, occurring frequently in the neck, suppurating slowly and imperfectly, and healing with difficulty. Recent pathologists, however, have given a more extended meaning to the word *scrofula*. According to them, it signifies a certain disease or defect of the constitution, in which there is a tendency to the production and deposition of a substance called *tubercle* in various tissues and organs; and tubercle must thus be regarded as the essential element of scrofula. It does not follow, however, that a deposit of tubercle should actually occur in every case of scrofula. The *tendency* is present, and the absence or presence of the deposit depends upon the extent of the affection, and is determined by various causes.

Sir James Paget, one of our most eminent pathologists, very clearly sums up what is generally understood by scrofula in the following paragraph: 'It is a state of constitution distinguished in some measure by peculiarities of appearance even during health, but much more by peculiar liability to certain diseases, including pulmonary phthisis. The chief of these "scrofulous" diseases are various swellings of the lymphatic glands, arising from causes which would be inadequate to produce them in ordinary healthy persons. The swellings are due sometimes to mere enlargement, as from an increase of natural structure, sometimes to chronic inflammation, sometimes to an acute inflammation or abscess, sometimes to tuberculous disease of the glands. But besides these, it is usual to reckon as "scrofulous" affections certain chronic inflammations of the joints; slowly progressive "carious" ulcerations of bones; chronic and frequent ulcers on the Cornea. Ophthalmia [q. v.], attended with extreme intolerance of light, but with little, if any, of the ordinary consequences of inflammation; frequent chronic abscesses; postules, or other cutaneous eruptions, frequently appearing upon slight affection of the health or local irritation; habitual swelling and catarrh of the mucous membrane of the nose; habitual swelling of the upper lip.' It is obvious that although the above-named forms of disease are often more or less coincident, they have nothing sufficiently in common to justify the general appellation of *scrofulous*. They are certainly not all tuberculous diseases, and hence Sir James Paget doubts whether the proposal to make *scrofulous* and *tuberculous* commensurate terms is practical, since the former, as generally employed, has a much wider significance than the latter.

The word is derived from the Lat. *scrofa*, a sow, it being supposed that this animal was especially liable to tumors such as occur in this disease. The Greek and Arabic names for the disease are similarly derived from the words signifying 'swine' in these languages. While *scrofula* was the popular, *struma* (supposed to be derived from *struo*, I heap up) used by Celus, Pliny, and other Latin writers, was the classical name for the disease. The vulgar English name, *The King's Evil*, is derived from the long-cherished belief that scrofulous tumors and abscesses could be cured by the royal touch. Multitudes of patients were submitted to this treatment, and, as the old historians assert, with perfect success, from the time of Edward the Confessor to the reign of Queen Anne. The writer of the article 'Scrofula' in *The English Cyclopædia*, mentions the curious historical facts that 'the old Jacobites considered that this power did not descend to Mary, William, or Anne, as they did not possess a full hereditary title, or, in other words, did not reign by divine right. The kings of the house of Brunswick have, we believe, never put this power to the proof; and the office for the ceremony which appears in our Liturgy as late as 1719 has been silently omitted. The exile princes of the house of Stuart were supposed to have inherited this virtue. Carte, in the well-known note to the first volume of his *History of England*, mentions the case of one Christopher Lowel, who, in 1716, went to Avignon, where the court was then held, and received a temporary cure; and when Prince Charles Edward was at Holyroodhouse in October 1745, he, although only claiming to be Prince of Wales and regent, touched a female child for the king's evil, who in 21 days is said to have been perfectly

cured.' The practice was introduced by Henry VII. of presenting the patient with a small coin (gold or silver).

The accompanying is an engraving of the identical touch-piece presented to Dr. Johnson (Lent 1712—when he was only thirty months old), who was one of the persons touched by Queen Anne.—The French kings also touched for the 'Evil,' the practice being traced back to Clovis, 481 A.D. On Easter Sunday, 1686, Louis XIV. is said to have touched 1600 persons, using the words: *Le roy te touche, Dieu te guerisse* (the king touches thee, may God cure thee). See Chambers's *Book of Days*, i. 82. The literature of

Touch-piece (time of Queen Anne).

this curious subject is somewhat extensive. The reader who wishes to pursue the inquiry further is referred to Tooker's *Charisma, sive Donum Sanctionis*, &c., 1597; Browne's *Charisma Basilicon, or the Royal Gift of Healing Strumæ*, &c., (1684); and Beckett's *Free and Impartial Inquiry into the Antiquity and Efficacy of Touching for the King's Evil*, 1722. The subject is also examined by Bishop Douglas in his *Criterion, or Miracles examined*, 1754; by Colquhoun, in his *Isis Revalata*, 1836 (who attributes the cure to animal magnetism); and by Howitt in his *History of the Supernatural in all Ages and Nations*, 1863.

Scrofula is a disease of early life, and when it does not exhibit any of its manifestations before the period of maturity it seldom shows itself afterwards.

In all systematic descriptions of this disease, two varieties of the scrofulous habit or diathesis are given, viz., the *sanguine* or *serous*, and the *phlegmatic* or *melancholic*. In the *sanguine*, there is a general want of muscular development, the limbs being soft and flabby; the skin is fair and thin; the features are delicate, the rosy hue of the cheeks contrasting strongly with the surrounding paleness; the eyes are gray or blue, and the eye-lashes long and silken; the hair fine and light colored or reddish; and the ends of the fingers broad and expanded, with convex nails bent over them; the intellect is lively and precocious, and there is often considerable beauty. In the *phlegmatic* variety the skin is pale or ruddy, dark, and often harsh; the general appearance dull and heavy; the hair dark and coarse; and the mind usually slow and torpid.

Children in whom the scrofulous constitution is strongly marked often present that narrow and projecting form of the chest to which the term 'pigeon-breasted' is commonly given; moreover, the abdomen is enlarged, the limbs wasted, and the circulation languid, in consequence of which they are especially liable to chilblains. The digestive organs are so commonly affected—as is evidenced by irregular action of the bowels, fetid breath and evacuations, furred tongue, capricious appetite, &c.—that, in the opinion of the late Dr. Todd, 'strumous dyspepsia presents a more characteristic feature of this habit of body than any physiognomical portrait that has been drawn of it.' In the great majority of cases the scrofulous disposition is hereditary; indeed, there is no disease which is nearly so often transmitted from parent to offspring as scrofula.

There is, however, scarcely any doubt that it may be acquired under the action of various unfavorable exciting causes, which may be ranked together 'as causes of debility.' Amongst them may be especially noticed (1.) Insufficient and improper food; (2.) Impure air; (3.) Insufficient exposure to direct sunlight; (4.) Exposure to wet and cold, and to sudden changes in temperature, especially if the clothing be insufficient; (5) Excessive and continued fatigue, whether bodily or mental; and (6.) Intense and prolonged anxiety or mental depression.

We shall first lay down the general principles of treatment to be adopted with the view of improving the health in the case of a person presenting either merely the general indications of a scrofulous habit of body, or some of its local manifestations, and we shall then conclude with a brief notice of a few of those particular forms of the disease which most frequently come under the attention of the medical practitioner.

The diet should be nutritious and sufficiently abundant, and animal food should be given at least twice daily. Dishes containing eggs and milk may usually be taken with advantage. If the patient is not very young, a little bitter ale taken at an early dinner will often promote digestion; if, however, it causes flushing or much sleepiness, it must be discontinued. A mother with scrofula should always provide a healthy wet-nurse for her child, as suckling in such a case is injurious both to parent and offspring. Flannel should always (both in summer and winter) be worn next the skin during the day, and the clothing must always be sufficient to keep the extremities warm. Constant residence in pure and dry air should be enforced as far as possible.

Unfortunately, the climate of Great Britain is by no means favorable to those possessing the scrofulous habit, and it is often very difficult for the physician to decide as to the choice of the most suitable residence. On this subject, Mr. Savory, in his essay on 'Scrofula' in Holmes's *System of Surgery*, vol. i., 1860, remarks that 'it is surely a mistake to suppose that a warm climate is the best adapted to all cases of scrofula. It is doubtless so in the great majority in which the disease [in the form of pulmonary consumption] is far advanced; but in many cases at an earlier stage, its further development is more satisfactorily arrested and the general health improved by a more bracing air. Children with tuberculous glands, but whose general health appears otherwise tolerably good, would perhaps profit less by transportation to Madeira or Egypt than by residence in the south-west coast of England, where the atmospheric changes are less frequent and sudden than in other parts of the kingdom, and the winter is comparatively mild. Delicacy of constitution is sometimes increased, and mischief encouraged, by dread of exposure.' Free exercise of the muscles and lungs in the open air should be insisted on in fine weather, and if this cannot be taken, the best substitute is friction over the surface of the body with the flesh-brush. Patients who can bear cold sea-bathing during the summer and autumn months will derive great advantage from it; but if a short immersion is not rapidly followed by a genial glow after drying the skin, such bathing is injurious, in which case warm salt-baths will be found useful.

Too much stress cannot be laid upon the fact that in the case of children the mind should be cheerfully occupied, but not overtasked. The medicines most esteemed in the treatment of scrofula are iodine and its compounds, the salts of iron, bark, sarsaparilla, the alkalies and mineral acids, and, above all, cod-liver oil. As the choice of the individual remedy must be left to the physician, we will merely remark that iodine and iron may often be advantageously prescribed together either in the form of the syrup of the iodide of iron, or of a well-known French preparation known as Blancard's Iodide of Iron Pills; and that to derive full benefit from cod-liver oil, it must be taken for a long time. As Mr. Savory remarks, the oil should be regarded as an article of diet rather than a medicine. A tablespoonful may be considered as a full dose for an adult; but this quantity should be gradually arrived at, the dose commencing with a teaspoonful. It is most easily taken when floating on a mixture of orange wine, or some other pleasant bitter fluid, with water. The lightest and clearest oil is probably the best, and in cold weather it should be slightly warmed before it is taken, for it is thus rendered more liquid and more easily swallowed. If what are commonly known as 'bilious symptoms' supervene, the use of the oil should be suspended for a couple of days, and a few gentle aperients should be prescribed.

Excluding pulmonary consumption, in which the leading pathological feature is the deposit of scrofulous matter or tubercle in the lungs, one of the forms of scrofula which most frequently presents itself is in the *lymphatic glands*, especially of the neck. The gland or glands may first become enlarged, either from an attack of acute inflammation, or from an indolent and painless deposit of tubercle. They may remain in this state either stationary or slowly enlarging for years, till from some accidental local irritation, or from some constitutional disturbance, they inflame and suppurate. After the discharge of the matter, the ulcerated skin usually heals with an ugly puckered cicatrix, which generally remains as a disfiguring mark through life. The local treatment consists in attempting to disperse the tumor, if it is hard and painless, by painting it with tincture of iodine, or by the application of iodine ointment. If it is soft, and likely to suppurate, the process may be facilitated by the application of warm water dressing or emollient poultices. When there is undoubted fluctuation, indicating the presence of pus or matter, it is usually regarded as the best practice to open the abscess with a narrow-bladed bistoury; but some surgeons still prefer allowing the matter to make its own way to the surface. The necessary internal treatment is that which has been already described. The *skin*, especially behind the ears, about the mouth, nostrils, and eyelids, and on the scalp, is liable to pustular diseases of a scrofulous origin. The free use of soap and water, followed by the application of black wash or zinc ointment, and proper constitutional treatment, will generally effect a cure, except in the horrible form of scrofulous ulceration of the skin of the face known as *Lupus* (q. v.).

Amongst other well-known and very serious scrofulous affections must be mentioned *Acute Hydrocephalus* and *Mesenteric Disease*, to which special articles are devoted. There is a peculiar and very intractable form of ulceration known as the *scrofulous ulcer*, which will be noticed in the article on ULCERS. The phys-

ical, chemical, and microscopical characters of the peculiar morbid deposit, to which reference has frequently been made in this article, will be found under the head of TUBERCLE and TUBERCULOSIS.

SCROFULOUS or Tuberculous Diseases are common amongst cattle, sheep, and pigs. In early life the tubercle is laid down in the mesenteric glands and occasionally about the joints. Along the exposed eastern coasts of Britain, scrofulous swellings are also met with about the head and neck; in some of the great grazing districts, the mucous membrane of the bowels is affected, constituting dysentery; but, as in man, the lungs are the most common site of tubercle, which here gives rise to pulmonary consumption. Scrofula in all its forms is hereditary, hence animals with any such taint should be rejected as breeding stock. It is induced and fostered by 'breeding in and in.' It may be developed, and is always aggravated, by debilitating influences, such as bad food, or exposure to wet or cold. Prevention is indured by breeding only from healthy vigorous, parents, and allowing the stock at all times adequate food and shelter.

SCROLL, an ornament of very common use in all styles of architecture. It consists of a band arranged in convolutions, like the end of a piece of paper rolled up. The Greeks used it in their Ionic and Corinthian Styles (q. v.); the Romans in their Composite; and in medieval architecture, and all styles which closely copy nature, it is of constant occurrence as in nature itself.

SCROPHULARIA'CEÆ, or SCROPHULARI'NEÆ, a natural order of exogenous plants, consisting chiefly of herbaceous and half-shrubby plants. The calyx is inferior, persistent, divided into five (sometimes four) unequal divisions. The corolla is monopetalous, more or less irregular, often two-lipped, exhibiting great variety of form; in the bud it has five (sometimes four) segments. The stamens are usually four, two long and two short, sometimes two, rarely five. The ovary is 2-celled, with many ovules; the style simple, the stigma generally 2-lobed. The lobes of the stigma sometimes display much irritability. The fruit is a capsule, or rarely a berry.—This order is a very large one, containing almost 2000 known species, which are distributed over the whole world, both in cold and warm climates. Acridity and bitterness are prevalent characteristics, and many species are poisonous. Some are root parasites. Some are admired and cultivated for their flowers; some are used medicinally. *Digitalis* or Foxglove, *Calceolaria*, *Mimulus*, Mullein, *Antirrhinum*, or Snapdragon, *Gratiola*, *Scrophularia* or Figwort, *Veronica* or Speedwell, and *Euphrasia* or Eyebright, are familiar examples. Very different from these humble herbaceous plants is *Paulownia imperialis*, a Japanese tree, 30 to 40 feet high, with trunk two or three feet in diameter, and flowers in panicles, about as large as those of the Common Foxglove.

SCRUPLE (Lat. *scripulum*, *scriplum*, or *scrupulum*) was the lowest denomination of weight among the Romans, and with them denoted the 24th part of an ounce (*uncia*), or the 288th of a pound (*libra*). As a measure of surface it was also the 24th part of the *uncia*, and the 288th of an acre (*jugerum*); seeming, in fact, to be the 24th of the 12th part of any unit. In later Roman times it became the name of the 60th part of an hour, and corresponded to our 'minute.' The 'minute' being the *scrupulum*, the 60th part of a minute was called a *scrupulum secundum* (whence the derivation of our word 'second'), the 60th part of this a *scrupulum tertium*, and so on. Lexicographers define 'scrupulum' to be a small pebble, such as would be likely to find its way between the sandal and the foot, whence the use of the term to signify a small difficulty or objection.—The term at the present time is a denomination in that modification of Troy weight which is used by apothecaries; it contains 20 Troy grains, is the third part of a drachm, the 24th of an ounce, and the 288th of a Troy pound.

SCUDERY, MADELEINE DE, a once notable French novelist, was born at Havre in 1607. Left an orphan at the age of six, she, along with a brother named Georges, was carefully educated by one of her uncles. While still young, she left Normandy for Paris, was admitted to the Hôtel Rambouillet (see RAMBOUILLET), and soon became one of the oracles of the brilliant society that assembled there. It was in this famous but showy circle that Mademoiselle S. gathered that immense fund of watery sentimentalism, platonic gallantries, 'polished' conversation, dull ceremonial incidents, affectations of moral purism, &c., which make up the tedious contents of her romances—*romans de longue haleine* (long-winded romances), as they have been felicitously nicknamed. Their popularity for a brief period was painfully wide. Everybody with the slightest pretensions to 'taste,' except the Port-royalists, Bossuet, and a few critics of the stricter sort, professed a boundless admiration for them. The bishops in general as Camus, Mascaron, Huet, Godeau, Fléchier, Massillon—were in raptures, and studied the stately trash with an ardor that considerably diminishes our respect for their understanding. When the troubles of the Fronde had broken up the gatherings at the Hôtel Rambouillet, Mademoiselle S. organized a literary circle of her own, which met every Saturday at her house in the Rue de Beauce. These 'Saturdays' began very well; but gradually they degenerated, and became ridiculous—pedantic and blue-stocking-ish they had been from the very first.

Nothing further in Mademoiselle S.'s life calls for notice. She died at Paris, 2d June 1701, at the advanced age of 94, honored and respected to the last; and it is but fair to admit that she seems to have been worthy of the regard in which she was held, being herself a perfect pattern of those watery virtues and superfine excellences of demeanor that she loved to depict. Her principal works (never again to be read in this world) are: *Ibrahim, ou l'Illustre Bassa* (Par. 4 vols. 1641); *Artamène, ou le Grand Cyrus* (Par. 10 vols. 1649—1653); *Clélie, Histoire Romaine* (Par. 10 vols. 1656); *Almahide, ou l'Esclave Reine* (Par. 8 vols. 1660); *Les Femmes illustres, ou les Harangues Héroïques* (Par. 1665); 10 vols. of *Conversations Nouvelles*, *Conversations Morales*, and *Entretiens de Morale* (1680—1692); besides *Lettres*, and *Poésies légères*, &c.—See Victor Cousin's *La Société Francaise au Dixseptième Siècle*.

SCU'DO (Ital. shield), an Italian silver coin, corresponding to the Spanish *piastre* (q. v.), the American dollar (q. v.), and the English crown (q. v.). It was so called from its bearing the heraldic shield of the prince by whose authority it was struck, and differed in value in the different states of Italy. In Rome, where it was called the *scudo Romano* or *scudo nuovo*, it was equal to 4*s.* 3*d.* sterling; and was subdivided into 10 *paoli* or 100 *bajocchi*. The Venetian scudo, or *scudo della croce*, was of higher value than the Roman one; while on the other hand, the old scudi of Bologna, Genoa, and Modena are inferior to it in value. Scudi are now gradually disappearing from the provinces of the Kingdom of Italy before the new decimal coinage, but the name is sometimes given to the piece of 5 lire, equivalent to a 5 franc-piece in the French coinage. Scudi of gold were also struck in Rome, the *scudo d'oro* being equivalent to 10 *scudi di argento*. See PIASTRE.

SCULL, SCULLING. A scull differs from an oar in size only. It is shorter, and less heavy. A man can only manage one oar; but he can pull with a pair of sculls, the ends of which lap over very little, or else do not meet within the boat.

Sculling has two senses, a river sense and a sea sense. In its freshwater acceptation, sculling is the act of propelling a boat by means of sculls in pairs. Among seafaring men, however, to scull is to drive a boat onward with one oar, worked like a screw over the stern.

SCU'LPTURE, the process of graving or cutting hard materials; from the Lat. *sculpo*, in Gr. *glypho*. Its common application is to artistic carving or cutting. Sculpture is the art of expressing ideas or images in solid materials. In this sense processes which do not, strictly speaking, involve the cutting of hard substances are included in the term. Sculpture, as in art, includes the moulding of soft materials as well. Clay, and even wax, have been in all ages of the art employed, sometimes for the purpose of sketches or models for reproduction in marble or metal, sometimes as the material of the finished work. The art of sculpture is as old as any that has been handed down to us. The Scriptures allude to the working of brass and other metals in the beginning of human society, and we read of the images of Laban carried off by his daughter. The great nations of antiquity all practised it, though only Nineveh and Egypt have left us anything like a fair representation of the state of the art in those early times. From the nature of this art its productions have proved more durable than those of painting, and have come down to us in more numerous instances even than works of architecture. While the latter have been destroyed, and their materials used up, works of sculpture, being smaller, have remained buried, and from time to time have been reproduced for the instruction and enjoyment of modern nations.

As an art, or means of recording facts and representing ideas, sculpture has many disadvantages as compared with painting, neither color nor picturesque backgrounds being properly admissible in sculpture. To this rule, however, we shall find exceptions in the works of Ghiberti in the 15th century.

Sculptures are distinguished by different terms, according to the nature and completeness of the work. Groups or figures completely represented are said to be 'in the round.' Those only partially detached from the mass or background are said to be 'in relief.' This, again, is called 'high' or 'low relief,' according as the figure stands fully or slightly above the mass behind it. The ancient Egyptians employed another kind of relief, their figures being sunk below the surface, and only the prominent portions remaining level with it. In this case the background or unoccupied space is not cut away, but the figures are worked downwards into it. Another process is called 'intaglio,' the whole figure being regularly designed and moulded, but 'cut into' the material and inverted. This is usually applied to the making of gems and seals. Another sculptural process is that used in the treatment of metals. As metals are both harder than stone and more valuable, it is not possible to cut or grave works out of

masses of metal as is done in stone or gems. The metal is fused by heat, and the form is given it while in that state. This is done by first forming or moulding the design in clay or other soft material. Round the model thus formed, a mould is formed of sand, which is prepared and pressed round it in a wet state till it takes the complete form of the model, which is then removed, and the liquefied metal poured in. It takes the exact shape of the model by this means. These are said to be 'cast,' because of the casting of the liquid metal into the mould.

Other processes, however, have, in the finer works, to be applied. The metal retains the rough surface of the sand in which it has chilled. It is therefore worked over with a graving tool, to give it a final surface, and express every delicacy of form intended by the artist. In some cases this 'engraving' is in the form of ornamental design, such as dress, &c. Sometimes the whole design is engraved without any previous casting. In this case the metal has had its form given by 'hammering' or 'beating.' The metal, hot in the case of iron or bronze, or cold in the case of silver and gold, softer metals, is beaten on the anvil into its form. A coarser and deeper method of engraving is called 'chasing,' where deeper sinkings and bolder prominence are given to the different parts of the design.

Of moulding we have already spoken. We may now remark on the materials in use for these various purposes. In sculpturing, or cutting designs or figures, we generally find marbles have been employed; the most famous having been the 'Parian,' from the Isle of Paros, and the Pentelic, from the mountain of that name in Attica. Besides these, the ancients used numerous marbles—white, and latterly colored: the late classical sculptors sometimes employing both white and black, or colored, in lumps on the same work, the colored marble being used for the dress or hair as it might be. The Egyptians, besides the use of these materials, and various kinds of fine and coarse-grained stone, employed porphyry, purple and black, an exceedingly hard and difficult material to handle.

The modern sculptors have used the white marble of Carrara in Italy, an excellent material, but liable to veins and discolorations which are unfavorable to the art. 'Terra Cotta,' or burnt clay, was extensively in use both in ancient and modern times; the clay being moulded to the utmost delicacy while soft, and then baked to a red color. Singularly fine reliefs remain to us from the Etruscans and Greeks, as well as from Egypt and elsewhere, as may be seen in the British Museum. It has also been extensively used in modern times. The Egyptians modelled little figures in porcelain clay, and colored and enamelled them after the fashion of porcelain, and vast numbers of such are in most of our museums. The word 'toreutic,' from the Greek word *toreuo*, to pierce or bore, is usually applied to sculpture in metal. For this the metal most appropriate, and most generally used both in ancient and modern times, is 'bronze,' a mixture of copper and tin. It is also known as 'brass.' Other metals, in small quantities, were also introduced, and various kinds of bronze have resulted from this variety, as well as from the proportions of the two principal metals, the method of fusion, &c. Egina, Delos, and Corinth made different kinds of bronze, each of excellent quality. Besides this favorite metal, gold, silver, copper, and even lead, and mixtures of lead and tin, 'pewter,' have been used for artistic sculpture. In the celebrated period of Greek sculpture, gold and ivory were used together. These statues, two of which were made by Phidias, were called 'chryselephantine'—that is, of gold and ivory.

The ordinary modes of proceeding in sculpture have been very various; whether the more celebrated sculptors of ancient times cut out their designs at once without the previous rehearsal of a model, we do not know. It is, however, very probable. The Egyptian bas-reliefs may still be seen in some of their tombs, lined out, and corrected afterwards by a master's hand previous to execution. Michael Angelo, the most powerful of modern sculptors, is known to have worked many of his statues, without the use of any model, out of the blocks. Florence, and the Louvre (Paris), contain marble sketches or unfinished figures thus roughed out. The length and size of the chizel-marks show how boldly this great master went to work to within $\frac{1}{8}$th of an inch of his final surface. As, however, there can be no putting on of any of the substance of stone once reduced by inadvertence, the artist commonly makes his sketch or design, in small, in clay. This is subsequently enlarged, and then studied from 'the life;' that is, men, horses, draperies, &c., the most suitable to the artist's present purpose are selected, and with these before him, he corrects his design and perfects it while the material is soft. A mould is then taken, as in the case already described, and with a plaster instead of a metal cast before him, the artist proceeds to work on his marble. The cast being placed on one block, and the marble on one precisely similar, workmen proceed to place a needle on a measuring-rod, the rod resting against the block till it touches a point of the cast. The needle is then applied to the block on which the marble stands, and this is bored into till the needle touches it as it did the cast. In this way the distance of the various surfaces of the future figure from the outside of the unshaped marble are ascertained, and the workmen rough out the figure down to those measurements. The sculptor then gives the final and delicate touches that finish it, himself. Finally, it is brought smooth with pumice-stone or sand. Michael Angelo and some of the ancients actually polished their statues. This, however, is generally objected to, as the sharp points of reflected light injure the general effect of the form.

We must notice one other question relative to sculpture before proceeding to a short review of the art historically, that is color. The ancients—that is, Egyptians, Ninevites, and others—did color their statues, intending, probably, to de so up to 'life'—that is, to a direct imitation. The Greeks, too, employed color on their statues, certainly on their architecture. To what extent they colored their statues, it is not very easy to determine. Partly, indeed, time has so altered, and partly so obliterated the coloring material, that we can only form an approximate judgment. It seems probable that the coloring was conventional, that is, that color was used to add to the splendor and distant effect of the work, rather than to attempt any positive imitation of real life. A head in the Elgin Room of the British Museum has been colored, the hair full red. The eyes are completely cut out, so as to show dark and shadowy hollows, even with the face colored. Gilding, too, was used for the hair. Color was extensively used in the middle ages. Many, if not most, interior sculptures were colored during that period. Quite in our own days Mr. Gibson has colored female statues. It is open to doubt whether they can be called successful as far as the color goes. Other means, however, were used to give color in late classic times, as may be seen in the Vatican, where a bust retains both enamelled eyes and black eyelashes inserted into the marble. To the mixture of marbles to obtain the effect of color we have already alluded.

Speaking of sculpture generally, we may say that a great deal has come down to us. Of the best work known, that of Phidias, our readers will see notices under the head of the ELGIN MARBLES. The majority of portable works are statues. Of these, some calculations reckon as many as 60,000 of one kind and another.

Fragments of these have various terms applied to them. 'Busts' are heads, or heads and chests; a 'torso' is a figure without head or limbs. These are perhaps fragments. Horace, however, is supposed to allude to a recognized form of such pieces of sculpture in the words 'mediam minervam.' Statues are called 'terminal' when they consist of a head only made out, the body being represented by a square post. These were set up as boundary marks, to invoke favorite deities for the owner's prosperity, and hence the name 'terminal.'

We now proceed to a very summary survey of the history of sculpture. We have said that ancient nations, both of profane and sacred history, were well used to sculpture. Of these, the Egyptian and the Ninevite are best known. The Egyptian sculpture goes back as far as 1700, or even in the case of the Pyramids, to 2000 years before Christ (Gardner Wilkinson, *Ancient Egyptians*). Both sculptured the human form, the Egyptians with most knowledge and refinement; both were restricted by religious traditions from arriving at a full representation of the human form; both used mixed forms of man-headed bulls, or man-headed and ram-headed lions. Usually these were colossal. The Egyptians, besides this, covered the walls of their sepulchres and temples with spirited and amply detailed historical representations.

The next great nation of whose productions we can judge was the Etruscan. They were of Greek origin. There is a great oriental influence or character in their work. It is also to some extent conventional, but often full of sublimity, and the figure quite correct in outline. This also is illustrated by their pottery, covered with figure designs, of which great abundance has been excavated in various parts of Italy. All these schools, including the Etruscan, are stiff and dry in execution—that is, wanting in the ease, fulness, and movement of the human form. They are called 'archaic,' meaning by that term unformed and undeveloped, belonging to an age uninstructed in technical knowledge.

Beginning with the early Egyptian times, this first period, called Archaic, may be concluded with those of the Etruscans, and brings us down to about 600 B.C. From this time a rapid growth in the art took place; schools were formed in the great cities of Greece, Sicyon, Egina, and Corinth; and we read of Callon, Onatas, Glaucias, and other names, culminating in Agcladas of Argos. These men sculptured on a colossal scale, and we have already alluded to the bronze for which the Greek cities had long been famous. These schools produced the famous works known as the Egina Marbles, found in 1812, as well as those of Selinus, in Sicily. Casts of the former may be seen in the British Museum. The originals are at Munich.

The great period of sculpture began about 484, when Phidias was born. Ageladas was his master, as also of Polycletus and Myron, of whose works copies are now in the Vatican and elsewhere, made by Greek artists in the times of the Roman empire.

Of the great work of Phidias we will not here treat, as it is described elsewhere. Pericles did much to encourage the arts both of sculpture and painting.

For a century and a half, or for two, sculpture continued very slowly to decline. This great school ended in Praxiteles, a sculptor of consummate powers. He carried the representation of the human form further than Phidias and his scholars, and draperies in his hands lost their severe character, and clung to the rounded limbs, which they no longer concealed. His work may be seen in the casts of the Nike Apteros, or sculptors of the temple of unwinged Victory, in the British and other museums. He is said to have been the first to represent the female form quite nude, and to have contributed by such sculptures to the enervation and gradual sensualizing of the art.

During the 5th and 4th centuries B.C., we have Agoracritos of Paros; Alcamenes of Athens; Scopas, the author of the famous Niobe group now at Florence; Lysippus of Sicyon, the favorite of Alexander; Chares, the author of the famous Colossus of Rhodes; Agasias, who sculptured the 'Fighting Gladiator;' Glycon of the Farnese Hercules; and many others.

The Roman conquest of Corinth under Mummius in the 2d c., and afterwards of Athens, brought this old art to an end. Thenceforth, Greek artists were found all over the Roman empire, and the famous works of these former sculptors were reproduced by them for their new masters. The Roman sculpture, indeed, is included in this phase of Greek art—the last remarkable work that we shall notice of classic times being the famous column of Trajan, in the early part of the 2d c. A.D. This is, in fact, a tower over 100 feet high, of white marble, entirely covered with bas-reliefs representing the Dacian wars of Trajan. We here see the expiring effort of classic art. Skilful and correct as the design is, it is, as a whole, graceless, stiff, and without beauty, compared with the old work.

Constantine, in the 4th c. of our era, carried off to Byzantium, his new seat of government, all the sculpture he could remove.

The art revived in Italy. As early as the 10th c., sculpture exhibited both design and grandeur, though wholly different from that of older times. Absolute freedom from old conventionalities, vigor, dignity, and childlike freshness of mind, distinguishes modern sculpture down to the 15th century. The most noted names we will mention here are those of Niccolo of Pisa, in the 13th c., who executed the bas-reliefs at Orvieto; after him, his son Giovanni. Andrea Pisano made one of the bronze gates of the baptistery of Florence. Ghiberti, the author of the more famous doors of the same baptistery, is next to be named; then Donato di Betto Bardi, or Donatello. Some of his works are in the church of Or san Michele, which the famous Orcagna, sculptor, painter, and architect, had built and decorated.

We begin the next period with Verocchio, in the 15th c., and the more famous Michael Angelo in the 16th. A host of great names followed: Cellini, Torregiano (who made the monument of Henry VII. at Westminster), Della Porta, Giovanni di Bologna, and Luca della Robbia, who also worked in enamelled terra-cotta on a large scale. These are Italian names. We may add Jean Goujon and Germain Pilon in France. In our own country, splendid medieval works are to be seen in the noble sculptures of Wells' Cathedral, and of that of Lincoln, coeval with those of the Pisani. Cibber, who sculptured in England, was a Dane. Thorwaldsen, a native of Iceland; Canova, an Italian; and, lastly, Flaxman, bring us down to our own days. Of the latter, the finest work is perhaps the Wellington Shield, after the Homeric description of that of Achilles. See the works of Winckelmann and Kugler, Westmacott's *Handbook of Sculpture*, and Murray's *History of Greek Sculpture*.

SCULPTURED STONES. In Norway, Denmark, the Isle of Man, Wales, Ireland, and Scotland, a class of monuments is to be found decorated with rude sculpture, and belonging to the early periods of Christianity—sometimes, indeed, showing the symbols of paganism in conjunction with those of Christianity. By far the most remarkable stones of this description are those found in Scotland, which, with some points common to them with the rest, possess the distinguishing feature of a class of characters or symbols of mysterious origin, whose meaning yet remains an enigma to antiquaries, and which yet recur with such constancy in different combinations, that it is impossible to suppose their form to be the work of chance. Along with these symbols the figure of the cross is often found on one side.

Neither in Ireland, in Wales, nor anywhere else, are the symbols in question to be met with. These monuments all occur within a circumscribed part of Scotland. None are to be found either within the ancient Dalriada, or south of the Forth; their limit seems to be the eastern lowlands from Dunrobin to Largo Law, or the part of Scotland inhabited by the Pictish race. From 150 to 200 of them are known to exist. The most interesting as well as the most numerous specimens are in Strathmore, at Glammis, Meigle, and Aberlemno. Among the various theories which have been formed regarding these stones, one is, that they were boundary stones, the cross denoting the possession of the church, and the mysterious figures having reference to the lay lord; but those antiquaries who have devoted most attention to the subject, including Mr. John Stuart, have come to the conclusion that they are sepulchral. The practice of erecting stones to commemorate deceased persons of note, existed in Scotland in pagan times, and, like other pagan practices, it was turned to Christian purposes by the earliest preachers of Christianity. Most of these monuments are of unhewn stone, and more or less oblong in shape; a very few have the form of a cross. A sculptured cross is met with on about half of them, the class without crosses belonging chiefly to Aberdeenshire, though a few of them are to be found in the country north of Spey.

Among the symbols to which we have alluded, one of the most frequent, which has been likened to the letter Z, consists of a diagonal line, from whose extremities are drawn two parallel lines terminating in some sort of ornament. This Z symbol is often traversed with what has been called the *spectacle ornament*, consisting of two circles decorated within with foliated lines, and united by two reversed curves or occasionally intertwined with a serpent. Another prevalent symbol is a crescent, sometimes appearing by itself, more frequently with two lines drawn through it, diverging diagonally from a point below its center, and terminating in a floral or other ornament. A mirror and comb, a horse-shoe arch, a fish, and a figure like a fibula, are also all occasionally met with. Similar devices to the above have been found engraved on certain silver ornaments discovered on Norrie's Law,

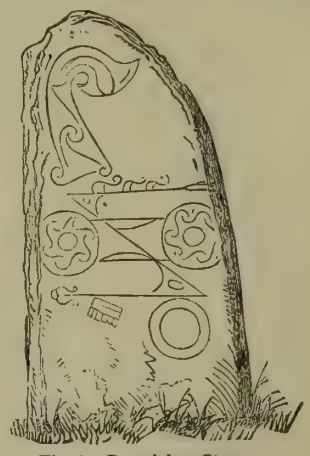

Fig. 1.—Dunnichen Stone.

Fig. 2.—Part of Sculptured Stone—Island of Ellanmore, Argyleshire.

including a figure occurring on the Dunnichen Stone, which had been taken by ingenious theorists for the high cap of the Egyptian Osiris, surmounted by a lotus, but which, as engraved on one of those silver relics, appears to be the head of a dog or some other animal.

The earlier of the Scottish sculptured stones, such as the Maiden Stone in Aberdeenshire, and the older of the stones at Aberlemno, have no sculptures except of the class above described; the later combine these with devices of a more intelligible kind. An elephant is not unfrequent, represented in such a fashion, that it is obvious that the artist could never have seen one; and fabulous and grotesque figures abound, often drawn with considerable spirit. We have centaurs, lions, leopards, deer, beasts of chase, men shooting with a bow and arrow, men devoured by animals, processions with men and oxen, and priests in their robes with books. Many of these figures are highly interesting illustrations of the manners, customs, and dress of the period. On a stone near Glammis is a man with a crocodile's head. On the cross at St. Vigeans, a hybrid, half-bird half-beast, appears in the midst of a border of entwining snakes and fantastic creatures. A stone of great interest at Meigle contains a representation of a chariot. At Farnell is a group of figures that seems to be meant for the temptation. In but two instances have inscriptions been known to accompany these sculptures; in the one case the letters are so worn away as to be undecipherable; in the other instance, at St. Vigeans, a few letters can be traced of the same Celtic character which has been found on the earliest Irish monuments and the oldest tombs at Iona.

The general style of ornamentation of these stones, judging by a comparison with Anglo-Saxon illuminated MSS., has led to the conclusion that they were erected in the 8th or 9th c., a period when Christianity had but lately supplanted paganism among the Scottish Picts.

A stone differing in character from those described, now erected near the House of Newton in Aberdeenshire, in the same neigh-

borhood in which it was found, has been a notable puzzle to archæologists. It is not sculptured, but inscribed in a character which seems unique. Besides the principal inscription, there is another running along the edge, consisting of groups of short lines, and apparently in the Ogham (q. v.) character.

The crosses in Ireland are the likest to these Scottish monuments. They are chiefly found near churches and graveyards, and are generally cruciform, with a halo or circle binding the arms and stem together. They usually taper to the top, on which a conical capstone is fixed, and they are inserted in pedestals of stone, which are frequently covered with sculpture. Most of their subjects are from Scripture history, without anything like the Scotch symbols.

The Welsh crosses are, for the most part, in the form of a small cross within a circle, set on the top of a long shaft, the latter having at times interlaced ornaments in compartments. Many of them have inscriptions in the Romano-British character, relating to the persons in memory of whom they were erected.

The sculptured crosses of Scandinavia and Man somewhat resemble the Scotch monuments in their general style of ornamentation, though altogether destitue of the peculiar Scottish symbols. On some of them are Runic inscriptions. One inscription on a Manx cross indicates that Gaut (probably a Norwegian) made this cross and all on Man. Another is to the effect that ——— erected this cross to his father Ufag, but Gaut Bjornson made it. Professor Munch, from the character of the Runes on these crosses, assigns them for date the middle or end of the 11th century. See RUNES.

A hundred and fifty of the sculptured stones of Scotland have been carefully engraved and described in a very valuable work contributed to the Spalding Club by Mr. John Stuart. Some of those belonging to the county of Angus had been previously illustrated by the late Mr. Chalmers of Auldbar, in a volume forming one of the Bannatyne Club series.

SCUPPERS are holes, lined with lead, in a ship's side, intended to carry off rain or other water which may be shipped.

SCURVY, or SCORBU'TUS, is a disease which is characterized by a depraved condition of the blood. In consequence of this morbid state of the blood, there is great debility of the system at large, with a tendency to congestion, hæmorrhage, &c., in various parts of the body, and especially in the gums. It is a disease that has probably existed from the earliest times, but the first distinct account of it is contained in the history of the crusade of Louis IX., in the 13th c., against the Saracens of Egypt, during which the French army suffered greatly from it. In the 16th c. it prevailed endemically in various parts of the north of Europe, and it seems only to have abated about a century ago. It was in badly-fed armies, in besieged cities, and on board ship, that its ravages were most appalling, and it is believed that more seamen perished from scurvy alone than from all other causes combined, whether sickness, tempest, or battle. Whole crews were prostrated by this scourge, as in the well-known case of Lord Anson's memorable voyage.

Scurvy so closely resembles purpura in its general symptoms that it will be sufficient for us to refer to the article on that disease, and here merely to indicate the leading points of difference between the two diseases, which, notwithstanding their similarity, are essentially different. Scurvy is caused by a privation, for a considerable time, of fresh succulent vegetables, while purpura often makes its appearance when there has been no deficiency of this food, or special abstinence from it. Scurvy is most common in winter or the early spring, while summer and autumn are the seasons for purpura. In scurvy the gums are invariably swelled and spongy, and bleed readily; in purpura this is not necessarily the case. In scurvy there is extreme debility and depression of spirits, venesection and mercury do positive harm, while a cure is rapidly effected by the administration of lemon-juice, or of fresh fruits and vegetables; whereas in purpura there is little or no mental or bodily depression, venesection and mercury often give relief, while no marked and certain relief follows the administration of the lemon-juice and fruits that are all powerful in scurvy.

Although the virtues of lemon-juice in scurvy were known in this country as far back as 1636, when John Woodhall, Master in Surgery, published *The Surgeon's Mate, or Military and Domestic Medicine*, this invaluable medicine was not made an essential element of nautical diet till 1795. The effect of this official act may be estimated from the following numbers. In 1780 the number of cases of scurvy received into Haslar Hospital (a purely naval hospital) was 1457, while in 1806 there was only one case, and in 1807 only one case. Many naval surgeons of the present day have never seen a case of the disease. The potato possesses almost equally great antiscorbutic properties, and, fortunately, potatoes when cooked are as active as when taken raw. The late Dr. Baly, to whom we are indebted for this discovery, states that 'in several prisons the occurrence of scurvy has wholly ceased on the addition of a few pounds of potatoes being made to the weekly dietary.' The salutary action of potatoes is probably owing to their containing a considerable amount of tartaric acid, partly in combination with potash and lime, and partly free. In addition to the dietetic treatment, which should include easily-digested animal food, potatoes, such ripe fruits as can be procured, and an abundance of lemonade, little further need be prescribed. If necessary, constipation must be relieved by mild laxatives, such as rhubarb, and castor-oil; the appetite may be stimulated by bitter tonics, and opiates given to procure rest in cases of pain or obstinate wakefulness. When the gums are very troublesome, solutions of tannin, chloride of lime, or of nitrate of silver, may be applied to them. For an excellent account of this disease, the reader is referred to the article 'Scurvy' by Dr. Budd, in *The Library of Practical Medicine*.

SCURVY-GRASS (*Cochlearia*), a genus of plants of the natural order *Cruciferæ*, having small white flowers, and turgid many-seeded pouches; the cotyledons accumbent. The species are annual or biennial, rarely perennial, plants; of humble growth, with branched smooth stems, smooth simple leaves, and terminal racemes of flowers. They have an acrid biting taste, containing the same pungent volatile oil which is found in horse-radish, and are valued for their antiscorbutic properties. COMMON S. (*C. officinalis*) is sometimes a foot high; the root-leaves are stalked and heart-shaped; the pouches globose, ovate, or elliptical. It is a variable plant, and some of the other species described by botanists are probably not essentially different. They possess the same properties. S. is very common on the shores of Britain, growing both on rocks where there is little soil, and in muddy places. It is also found on high mountains. It is a very widely-distributed plant, and being found on the shores of almost all parts of the world, has often been of the greatest benefit to sailors, in times when the modern precautions against sea scurvy were unknown.

SCU'TAGE, or ESCUAGE, (Lat. *scutum*, shield), a pecuniary fine or tax sometimes levied by the crown, in feudal times, as a substitute for the personal service of the vasal. No scutage seems at any time to have been levied in Scotland.

SCU'TARI (Italian or Levantine form of the Turkish *Uskûdar*), a town of Asiatic Turkey, on the eastern shore of the Bosporus, immediately opposite Constantinople, of which it may be considered a suburb. It is built on the sides and summit of a hill, sloping irregularly upwards from the water's edge, and bears, both externally and internally, a great resemblance to the Turkish capital. It contains several mosques, bazaars, and baths, a college of howling dervishes, manufactories of silks and cotton fabrics, corn warehouses, and *imarets* or kitchens for the poor. It has long been famed for its extensive cemetries, adorned with magnificent cypresses, the chosen resting-place of many of the Turks of Constantinople, from attachment to the sacred soil of Asia, and the traditionary belief that their race will one day be driven out of Europe. The population is variously estimated at from 40,000 to 60,000 or 100,000. This town accidentally acquired great notoriety in connection with the English army during the Russian War (1854—1856), when the enormous barracks built by Sultan Mahmud, on the southern outskirts of the town, were occupied as barracks and hospital by the English troops, and formed the scene of Miss Nightingale's labors. A little to the south of the General Hospital, on the cliffs bordering the Sea of Marmora, is the densely-filled English burial-ground, where Baron Marochetti's monument in honor of the troops has lately been erected. —S. is a place of considerable traffic, and is the rendezvous and starting-point of caravans and travelers trading with the interior of Asia. It occupies the site of the ancient *Chrysopolis;* and about two miles to the south, lies the village of Kadikôi, the ancient *Chalcedon*.

SCUTARI (Turkish *Iskandere*, the anc. *Scodra*), a considerable town of European Turkey, in Northern Albania, capital of a sanjak of the same name, situated at the southern end of the Lake of Scutari, at the point where the Bojana, issuing from it, is joined by the Drinassi. The lake is about 20 miles long, and abounds in fish. S. is a fortified town, with a citadel on a commanding height. It has manufactories of arms and cotton goods, a bazaar, and yards for building coasting-vessels. It carries on a considerable trade. The population is estimated at about 40,000, of whom about one half are Roman Catholics.

SCU'TCHEON, in Carpentry, is the small metal plate used to form the protection and ornament to the keyhole for locks; it is usually of brass, but in ornamental cabinet-work, is often of ivory, mother of pearl, &c. See SHIELD.

SCY'LLA AND CHARY'BDIS. Scylla (Gr. *Skullaion*), a rocky cape on the west coast of South Italy, jutting out boldly into the sea so as to form a small peninsula just at the northern entrance to the Straits of Messina. About the beginning of the 5th c. (B.C.), a fort was built upon the rock (which is about 200 feet high, and much hollowed out below by the action of the

waves), and in course of time a small town grew up, straggling down the slopes towards the sea. The navigation at this place was looked upon by the ancients as attended with immense danger, which, however, seems to have been much exaggerated, for at the present day the risk is not more than attends the doubling of any ordinary cape. The rock, according to the Homeric legend, was the abode of a monster called Scylla, possessing 12 feet, 6 long necks and mouths, each with three rows of sharp teeth, and who barked like a dog.

There are other accounts of Scylla, one of which represents her as having once been a beautiful maiden, beloved by the sea-god Glaucus, but who, by the jealousy of Circé, was changed into a monster having the upper part of the body that of a woman, while the lower part consisted of the tail of a fish or serpent surrounded by dogs. The modern Scilla or Sciglio is a fortified town in the province of Reggio-Calabria, having large silk-works, the pop. being upwards of 7400, mostly seafaring people.

Charybdis (modern name *Galofaro*), is a celebrated whirlpool in the Straits of Messina, nearly opposite the entrance to the harbor of Messina in Sicily, and in ancient writings always mentioned in conjunction with Scylla. The navigation of this whirlpool is, even at the present day, considered to be very dangerous, and must have been exceedingly so to the open ships of the ancients. A modern writer describes it as being 'an agitated water of from 70 to 90 fathoms in depth, circling in quick eddies.' Homer places it immediately opposite to Scylla, probably taking advantage of the poetic license to exaggerate the danger of the navigation, although it is not improbable that the whirlpool may have changed its situation since his days. The myth connected with it is, that under a large fig-tree, which grew out of a rock opposite Scylla, dwelt the monster Charybdis, who thrice every day sucked down the water of the sea, and thrice threw it up again.

SCYTHE. See REAPING.

SCY'THIA, a name employed in ancient times to denote a vast, indefinite, and almost unknown territory north and east of the Black Sea, the Caspian, and the Sea of Aral. But the term is not so much *geographical* as *ethnological*, and the only interest attaching to the barren catalogue of tribes and nations which we meet with in the classical writers, springs from the hope of connecting these with a recognized race of modern times. Latham argues—successfully, as it appears to us—for the Scythians being the ancestors of the later *Turks*, and maintains their central and primitive abode to have been Independent Tartary, whence they spread west round the Caspian into Russia, Transylvania, and perhaps even Eastern Hungary. Niebuhr and Neumann favor the hypothesis of a Mongol origin for the Scythians; while others regard them as Finns or Circassians. In their mode of life they were mainly nomadic and pastoral, though we read of some trans-Danubian and Euxine tribes that followed agriculture. Many of them were *Hippemolgi* ('mare-milkers').

SEA, in its general signification, denotes that large expanse of salt water which covers the more depressed portion of the earth's surface, fills up each hollow and rift to a certain uniform level, completing as far as possible the spheroidicity of the globe, and divides its surface into two great and innumerable smaller portions—the Old and New Worlds and their islands. This immense body of water is not distributed with the least approach to regularity, but here forms a huge basin, there becomes a long and tortuous inlet or strait, which narrows or widens as the configuration of the land-surface on each side permits; nor is it placed symmetrically to the earth's axis of rotation; for the hemisphere of which the south-west corner of England is the center or pole contains the whole of the land-surface, if we except the triangular portion of South America, south of Uruguay, Australia, New Zealand, the most of the East Indian Islands, and the land around the south pole (of unknown extent). The other hemisphere is, with these exceptions, wholly water. From this irregular distribution of the sea over the earth's surface, and from the specific gravity of water being about $\frac{1}{4}$th of that of the land, it necessarily follows that the center of gravity of the whole globe does not correspond accurately with its center of figure. The extent of sea-surface is estimated at 144,712,850 English sq. m., or nearly $\frac{3}{4}$ths of the whole of the earth's surface, and its mass, on the supposition of an average depth of 2 miles, is about $\frac{1}{4000}$ of that of the whole globe; such estimates, however, can be considered at best as only rough approximations. One of the most remarkable features of the sea is its continuity or oneness; for in spite of the fact, that numerous large stretches of salt-water, as the Sea of Azof, Black, Mediterranean, and Baltic Seas, the Gulf of Mexico, and others, have barely avoided becoming detached lakes, very few such are found on the earth's surface; and with the exception of the Caspian and Aral Seas, they are of small size.

Composition, Specific Gravity, and Temperature of the Sea.—The ocean consists of salt water, and from its continual motion, under the influence of currents and waves, preserves, generally speaking, uniform saltness. Under special circumstances, however, we find the saltness increased, as by the excess of evaporation over the fresh-water influx in the Mediterranean and Red Seas, and about the northern and southern limits of the tropical belt; and decreased, by the contrary cause, in the Sea of Azov, Black Sea, Baltic Sea, and in the polar regions. See TRADE-WINDS. The origin of the saltness of the sea is sufficiently accounted for when we consider, that the chloride of sodium and other soluble salts which form constituent ingredients of the globe, are being constantly washed out of the soil and rocks by rain and springs, and carried down by the rivers; and as the evaporation which feeds the rivers carries none of the dissolved matter back to the land, the tendency is to accumulate in the sea. The principal ingredients found in sea-water are chloride of sodium, or common salt, together with salts of magnesia and lime. A more exact analysis will be given under WATER. The average specific gravity of the sea, out of reach of the exceptional action of the melting of snow, rain, or river-water is (at 62° F.) 1·02655. The slight variations in the saltness of the sea must necessarily produce corresponding changes in its specific gravity; accordingly, on the northern and southern limits of the torrid zone, the mean specific gravity of the sea is, in different longitudes, 1·02785, 1·0268; while at the equatorial calm belt, it is 1·0252, 1·0267; and on the whole shows a tendency to diminish as the latitude increases, Beechey having found it to be 1·0258 in lats. 55°—60° N. and S. in the Pacific, and King 1·0255 in the corresponding latitudes of the Atlantic. It is considerably diminished near the mouths of rivers, and in those inlets or semi-lacustrine arms which are the depositories of more river-water than compensates for their evaporation, as in the Black Sea, where it is 1·0143, and in the Baltic, only 1·0086.

The temperature of the sea, where it is not affected by currents from a warmer or colder region, necessarily corresponds to the normal temperature of the latitude; but this is true only of the water at and near the surface, for it has been recently proved by the observations made on deep-sea temperature by Carpenter, Wyville, Thomson, and others, that the temperature rapidly diminishes with the depth, particularly in tropical and temperate regions, till at great depths ice-cold water is everywhere found. Thus, from the extensive observations made by H.M.S. *Challenger* in the North Atlantic during 1873, it is shown that at the equator, where the surface temperature is about 80°, the decrease with the depth is so rapid, that at 60 fathoms from the surface the temperature is only 61°·5; at 150 fathoms it is 50°; at 700 fathoms, the temperature has fallen to 40°; at about 1600 fathoms, to 36°. Below this it diminishes at a much slower rate, till it falls nearly to freezing at all great depths which are connected by under-currents with the Antarctic or Arctic Seas. The sea-water of the upper 60 or 80 fathoms is affected by the solar heat. Immediately beneath this sun-heated upper stratum, it is remarkable that all the water in the North Atlantic, as far as lat. 40°, is warmer than that at the same depth under the equator. The mean temperature of the upper 1500 fathoms in the North Atlantic is 4°·5 warmer than the same upper stratum at the equator.

As regards the temperature of the water at the bottom, at all stations between Bermuda and the equator on the east side of the Atlantic, the temperature is remarkably uniform at 35°·2; in the Bay of Biscay, to north-east of this line, it is 1° warmer; south-west of the same line, 1° colder; whereas, further south at the equator, on the western side of the Atlantic, it is 32°·4, or 2°·8 colder. This last fact is of very great importance, since, from the circumstance that at the equator the bottom temperature is 32°·4, and that at all stations to the north of it the bottom temperature is warmer, it follows that the cold water at the bottom of the Atlantic, as far north as the Azores and Bay of Biscay, equally with that at the equator, is derived from an Antarctic, and not from an Arctic source. This cold Antarctic current entering the North Atlantic, is found between 1700 fathoms and the bottom, a total thickness of 700 fathoms. Ice-cold water has also been found at the bottom in the Arabian Sea. In land-locked seas, such as the Mediterranean, whose deep water is not in communication with that of the Atlantic, owing to the shallowness of the sea at the Straits of Gibraltar, the bottom temperature does not fall so low as that of the ocean. Thus the temperature of the Mediterranean at 1508 fathoms, is 55°, whereas at this depth in the ocean, it is so low as 36°. See ISOTHERMAL LINES.

The highest surface-temperature does not correspond with the equator, but owing to the disturbing influence of currents in the following regions: Between Sumatra and the Zanzibar Coast; east of the Philippine Islands, to long. 170° E.; east of Cuba and Florida; and north-east of Cape St. Roque.

Color and Phosphorescence of the Sea.—The color of the ocean, when free from admixture of foreign substances, as animalcules, vegetable organisms, excessive rain, or the tinted waters of swollen rivers, is a pure deep blue, which becomes less marked where the water is of less depth. A 'different' color of sea-water is due to the presence of some foreign substance, e. g., the red, brown, and white patches of the Pacific and Indian Oceans, to the presence of swarms of animalcules, and the colors of the

Red and Yellow Seas, to matters of vegetable origin. The Rhone, at its emergence from the lake of Geneva, and the lake itself, exhibit an intensity of blue far surpassing that of any sea. The phosphorescence of the sea is due to the presence of myriads of invertebrata, especially rhizopoda, tunicata, &c. See LUMINOSITY OF ORGANIC BODIES.

Depth of the Sea.—Till very recently, it might be said that, with the exception of the more frequented strips along the coast, and such other portions as afforded anchorage-ground, our knowledge of the depth of the ocean amounted to nothing. It is true that deep-sea soundings had been frequently made, but from the necessary defectiveness of the ordinary 'lead,' and inattention to the effect of under-currents in destroying the perpendicularity of the line, little dependence could be placed on the results obtained.

It is chiefly in the Atlantic that the new and trustworthy method of Sounding (q. v.) has been practised, and the contours of its bottom may now be considered as fairly ascertained. The greatest depth measured by the *Challenger* (in N. lat. 19° 41′, W. long. 65° 7′) was 3875 fathoms, or 23,250 feet (about 4·4 miles). Over a great extent of the area, the depth ranges between 2000 and 3000 fathoms. Along the middle runs an irregular ridge, on which the depth is less than 2000 fathoms, and north of 50° a plateau of similar depth extends, with little interruption, from Ireland to Newfoundland, on which the telegraph cables are laid. Nowhere round the British Isles is the sea above 400 feet deep. In the Pacific, several tracks of soundings were obtained during the *Challenger* expedition (1873–5). From the numerous islands which stud this ocean, one might be led to assume its comparative shallowness; but this is far from being the case, for the islands rise abruptly from the bottom, and very deep soundings have been obtained near their shores. Over a great part of the area, the depth is over 2000 fathoms; in the deeper parts, it ranges from 3000 to over 4000 fathoms. The deepest sounding got was 4475 fathoms (26,850 feet, or above 5 miles), in N. lat. 11° 24′, E. long. 143° 16′, near the Ladrone Islands. From the remarkable gentleness of slope of the bed of the Arctic Ocean to the north of Siberia, the line giving only 14—15 fathoms at 150 miles from the shore, and from its configuration on the north of America, it is generally concluded to be by far the shallowest of the oceans. Of the depth of the Antartic Ocean, little is *known*, but it is supposed to be deeper than its antipodal kinsman. Near the Antarctic Circle, south-east from Kerguelen, the *Challenger* took a few soundings varying from 1300 to 1975 fathoms. From all that has hitherto been observed, it would seem as if the land-surface under water were the counterpart as regards eminences and hollows, chasms, valleys, plateaus, &c., of the land-surface above.

Motion of the Sea.—The sea is in a state of perpetual restlessness, its motion being either a vertical oscillation, or an actual transference of its waters from one place to another. The first motion, which constitutes *waves*, is due either to the attraction of the sun and moon on such a mobile body as the sea (see TIDES), or to the impulsive action of the winds which blow over its surface (see WAVES); the second arises from the sun, which, directly through its heat, and indirectly by scorching dry winds, produces evaporation to a great extent, of the parts most exposed to its influence, and by its similar action on the atmosphere (see TRADE-WINDS), causes a transference of this vapor to remote latitudes, where it descends as rain, and, destroying the equilibrium of the sea, gives rise to *currents*. The nature of these currents is described under GULF STREAM, and the chief currents of each ocean are found under its own head. This constant motion of the sea is of great service in tending to equalize the temperature of different parts of the globe; it also produces remarkable changes in the form of coasts, eating into rocks, converting low-lying lands into shoals and sand-banks, or carrying away the earthy materials, and depositing them in some distant region. The erosive action of the sea is generally almost imperceptible during several years, but in course of two or three centuries, the magnitude of the changes effected by it is almost incredible.

On the economic value of the sea as a purifier, and as a commercial highway, it is unnecessary to dilate. For some of the peculiar phenomena of the sea, see ICEBERGS, AURORA BOREALIS, WHIRLPOOLS, the five great OCEANS (q. v.), CORAL, &c.

The term *Sea* is also applied in a more limited though indefinite sense, to an offshoot of one of the oceans, as to the Black, Baltic, Okhotsk Seas, to any portion of an ocean which from its position or configuration is considered deserving of a special name, and to the two great inland salt lakes of Central Asia, the Caspian and Aral Seas.

SEA, SOVEREIGNTY OF THE. Blackstone lays it down that the main or high seas are part of the realm of England, as the Courts of Admiralty have jurisdiction there; but adds that they are not subject to common law. But the law of nations, as now understood, recognizes no dominion in any one nation over the high seas, which are the highway of all nations, and governed by the public law of the civilized world. Such a right has, however, long been claimed over the four seas surrounding the British Isles. It was strongly asserted by Selden, and denied by Grotius, and measures were taken to vindicate the right in the reign of Charles I. Every nation has undoubtedly a right to the exclusive dominion of the sea within a certain not very well-defined distance from the shore, depending on the usage of the country. This right of lordship includes the right to free navigation, to fishing, to taking wrecks, the forbidding passage to enemies, the right of flag, of jurisdiction, &c. By the law of England, the main sea begins at low-water mark; and between low and high water mark the common law and admiralty have a divided jurisdiction, one on land when left dry, the other on the water when it is full sea. By the law of Scotland, the sea-shore is not considered to extend beyond the point which the sea reaches in ordinary tides. See BLOCKADE, NEUTRALS.

SEA CUCUMBER. See HOLOTHURIA.

SEA GRAPE (*Ephedra*), a genus of plants of the natural order *Gnetaceæ*, a natural order consisting of a small number of species, closely allied in botanical characters to the *Coniferæ*, and by many botanists united with that order, although differing much in appearance. The *Gnetaceæ* are small trees, or twiggy shrubs, with opposite or clustered branches and jointed stems, whence they are sometimes called JOINT-FIRS. They secrete not resinous but watery matter. The development of the ovule is very peculiar; it has a projecting process formed from the intimate covering of the nucleus.

SEA'HAM HARBOR, a seaport in the county of Durham, 6 miles south of Sunderland. Its excellent harbor is furnished with wharfs, quays, and jetties, and the town contains bottle-works, blast furnaces, an iron foundry, and chemical works. It communicates by railway with collieries in the vicinity, and the principal articles of export are coals and agricultural produce. The population of this thriving little seaport town was, in 1871, 7132. The population in 1851 being 3538, it has accordingly more than doubled meantime.

Sea-horse.

SEA-HORSE, in Heraldry, a fabulous animal, consisting of the upper part of a horse with webbed feet, united to the tail of a fish. A scalloped fin is carried down the back. The arms of the town of Cambridge are supported by two sea-horses, proper finned and maned or.

SEA-KALE (*Crambe maritima;* see CRAMBE), a perennial plant with large roundish sinuated sea-green leaves, found on the sea-shores in various parts of Europe, and in Britain. The blanched sprouts have become a very favorite esculent in Britain, although as yet little known on the continent. The common people, on some of the shores of England, had long been in the practice of watching them when they came through the sand, and using them as a pot-herb, but the cultivation of the plant in the kitchen garden became general only at a comparatively recent date. It requires a deep rich soil, and the care of the gardener is bestowed upon the blanching, without which the sprouts are not tender and agreeable, but even acrid. The blanching is accomplished in various ways, by earth, sand, boards, earthenware pots, &c. Sea-kale is generally raised from seed, although, also sometimes propagated by offsets or by cuttings of the roots. The seedlings do not yield a crop till the third year; but a plantation of sea-kale remains productive for many years. It is planted in rows, four to six feet apart. It sends its tap-root very deep into the ground.

SEAL (Lat. *sigillum*, Fr. *sceau*), an impression on wax or other soft substance made from a die or matrix of metal, a gem, or some other material. The stamp which yields the impression is sometimes itself called the seal. In Egypt, seals were in use at an early period, the matrix generally forming part of a ring (see GEM, RING). Devices of a variety of sorts were in use at Rome, both by the earlier emperors and private individuals. The emperors, after the time of Constantine, introduced *bullæ* or leaden seals, and their use was continued after the fall of the Western Empire by the popes, who attached them to documents by cords or bands.

On the earlier papal seals are monograms of the pope; afterwards the great seal contained the name of the pope in full, and a cross between the heads of St. Peter and St. Paul, while the papal privy seal, impressed not on lead but on wax, known as the *Seal of the Fisherman*, represented St. Peter fishing. In the 9th and 10th centuries we find Charlemagne, the Byzantine emperors and the Venetian doges, occasionally sealing with gold, and we have an instance as late as the 16th c. of a gold seal appended to the treaty of the Field of the Cloth of Gold, between Henry VIII. and Francis I.

Seals were not much used in England in Anglo-Saxon times, but they came into general use after the Norman Conquest. On

the royal great seals was the king in armor on a caparisoned horse galloping, his arms being shown on his shield after the period when arms came into use; and the reverse represented the king seated on a throne. The great seals of Scotland begin with Dun-

Great Seal of William the Conqueror.

can II. in the end of the 11th c., and have also for subject the king on horseback; the counterseal, with the seated figure, being used first by Alexander I., and the earliest appearance of the arms of Scotland being on the seal of Alexander II. In both countries there were also the privy seals with the royal arms only.

Ecclesiastical seals first appear in the 9th c., and attained great beauty in the 13th and 14th. They are of the pointed oval form known as *Vesica piscis;* and have for subjects, a figure of the bishop, sometimes of the Trinity, the Virgin, or a patron saint, seated under an elaborate architectural canopy. The arms of the bishop are often added.

Under the Norman monarchs of England, sealing became a legal formality, necessary to the authentication of a deed; and from the 13th c. onwards, the seals of all persons of noble or gentle birth represented their armorial ensigns. The seal was generally appended to the document by passing a strip of parchment or a cord through a slit in its lower edge; and the ends being held together, the wax was pressed or moulded round them a short distance from the extremity, and the matrix impressed on it. Occasionally the seal was not pendant, but the wax was spread on the deed. The colored wax with the impression was sometimes imbedded in a mass of white wax forming a protective border to it. In England, a seal is still an essential to all legal instruments by which real estate is conveyed; but since subscription has also become necessary, the practice of sealing has degenerated into a mere formality. The custom was gradually introduced of covering the wax with white paper, on which the impression was made, and latterly wafers have been considered a sufficient substitute for seals.

In Scotland, every freeholder was obliged by statutes of Robert III. and James I. to have his seal of arms, an impression of which was kept in the office of the clerk of court of the shire; and among the Scottish armorial seals of the 14th and 15th centuries are some of wonderful beauty of execution. Act 1540, c. 117, for the first time made subscription an essential formality to deeds; but sealing still continued to be necessary till 1584, when it was dispensed with in the case of deeds containing a clause of registration, and soon afterwards the practice was altogether laid aside.

The use of corporate seals by towns and boroughs, dates as far back as the 12th century. The earlier corporate seals bear the town gates, city walls, or some similar device; the use of corporate arms did not begin till the latter half of the 14th century.

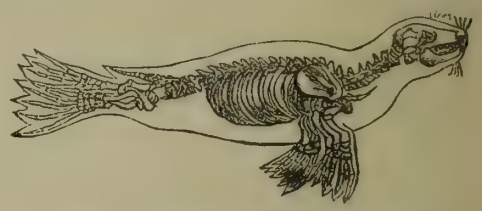
The principal use of seals in the present day is in closing letters, and even for this purpose they have of late years been less used than formerly, owing to the fashion of using stamped adhesive envelopes

The study of medieval seals is of great importance and interest in connection with many branches of archæology, including heraldic and genealogical investigations. See GREAT SEAL; PRIVY SEAL.

SEAL (*Phoca*), a carnivorous Mammal, the type of the family *Phocidæ*. The old Linnæan genus *Phoca* included the Morse (q. v.) or Walrus. The *Phocidæ* or seals proper, the *Otaridæ* (see OTARY), and the walrus, constitute the section *Pinnigrada* or *Pinnipedia* of the order *Carnivora* (q. v.). Their structure is most perfectly adapted to an aquatic life, and they live chiefly in water, but spend part of their time on shore, reposing and basking in the sunshine on rocks, sand-banks, ice-fields or beaches; and they bring forth their young on shore. The body is elongated, and tapers from the chest to the tail; the head somewhat resembles that of a dog, and in most of the species the brain is large; the feet are short, and little more than the paw projects beyond the skin of the body; all the feet are thoroughly webbed, and five-toed; the fore-feet are placed like those of other quadrupeds; but the hind-feet are directed backwards, like a prolongation of the body, and between them is a short tail. The toes, particularly those of the hind-feet, are capable of being spread out very widely in swimming, so as to give great propulsive power.

The movements of seals in the water are very rapid and graceful; on land, they are very peculiar; even the fore-feet being little used or not at all, but the body contracted by an upward bending of the spine, and so thrown forward by a succession of jerks; in which way, however, a S. makes its escape very rapidly from an assailant. The flexibility of the spine in seals is very remarkable, and depends on the very large intervertebral cartilages, formed of fibrous concentric rings. The muscles, which are connected with the spine on all sides, are of great strength.

The teeth differ considerably in the different genera, but in all are adapted for the seizure of slippery prey, the chief food of seals



Skeleton of Seal, with outline of the figure.

being fishes, although they do not reject other animal food, and are said even to feed in part on vegetable substances. Their incisors are either six in the upper jaw and four in the lower, or four in the upper and two in the lower; they all have large and strong canine teeth; and the molars, usually five or six on each side in each jaw, are either sharp-edged or conical, and beset with points. Seals have a remarkable habit of swallowing large stones, for which no probable reason has yet been conjectured. Their stomachs are very often found to be in part filled with stones. The stomach is quite simple; the gullet (*œsophagus*) enters it at the left extremity; the cœcum is short, the intestinal canal long.

The respiration of seals is extremely slow, about two minutes intervening between one breath and another, when the animal is on land and in full activity. A S. has been known to remain twenty-five minutes under water. Their slowness of respiration, and power of suspending it for a considerable time, is of great use, as enabling them to pursue their prey under water. The fur of seals is very smooth, and abundantly lubricated with an oily secretion. There is generally an inner coating of rich fur, through which grow long hairs, forming an outer covering. Another adaptation to aquatic life and cold climates appears in a layer of fat immediately under the skin—from which *Seal Oil* is obtained—serving not only for support when food is scarce, but for protection from cold, and at the same time rendering the whole body lighter. The nostrils are capable of being readily and completely closed, and are so whilst the S. is under water; and there is a similar provision for the ears; whilst the eye, which is large, exhibits remarkable peculiarities, supposed to be intended for its adaptation to use both in air and water. The face is provided with strong whiskers, connected at their base with large nerves.

Seals produce their young only once a year; sometimes one, sometimes two at a birth. Not long after their birth, the young are conducted by the mother into the sea. Many, if not all, of the species are polygamous. Terrible fights occur among the males.

Seals are very much on their guard against the approach of man, where they have been much molested; but where they have been subjected to no molestation, they are far from being shy, and approach very close to boats, or to men on shore, as if animated by curiosity. They are much affected by musical sounds.

a flute is said to attract seals to a boat, where they have not learned caution from sore experience; and the ringing of the church bell at Hoy, in Orkney, has very often caused the appearance of numerous seals in the little bay. Seals possess all the five senses in great perfection.

The Common S. and some of the other species are very intelligent; but there is considerable difference in this respect among the species. The Common S. and some others have often been tamed, and are capable of living long in domestication, if freely supplied with water. They become very familiar with those who attend to them, are very fond of caresses and of notice, recognize their name like dogs, and readily learn many little tricks, of which advantage has been taken for exhibitions.

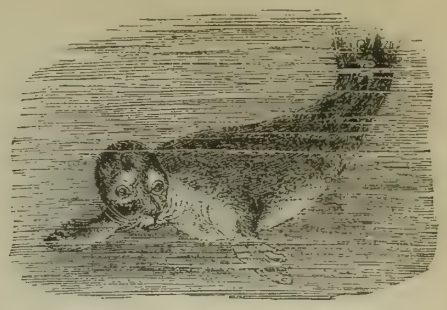
Seals are found in all the colder parts of the world, most abundantly in the arctic and antarctic regions; some of them also in temperate climates, as far south as the Mediterranean, and as far north as the La Plata. Some of them ascend rivers to some distance in pursuit of salmon and other fish. They are found in the Caspian Sea, and even in the fresh-water Lake Baikal.

The species are numerous, but in no group of Mammalia does more remain for further investigation. Seals are divided into two principal groups—*Seals*, more strictly so called, and *Otaries* (q. v.); the former distinguished by the complete want of external ears, which the latter possess, and by their dentition. The true seals have been further subdivided into genera chiefly characterized by their dentition. In the restricted genus *Phoca*, or *Calocephalus*, the incisors are pointed and sharp-edged, six above and four below. The Common S. (*Phoca vitulina*) is found in the northern parts of the Atlantic Ocean, and in the Arctic Ocean. It is common on the wilder and more unfrequented parts of the British coasts, particularly in the north. It is remarkably distinguished, even among its nearest congeners, by the oblique position of the molar teeth. The fur is yellowish, variously spotted, and marked with brown. The whole length is from 3 to 5 feet. Its love of salmon is so great that it has been known to haunt the neighborhood of a salmon-net for a long time, and to take the fish after they were entrapped in it. The Common S. is generally seen in small herds. Its skin and oil are of considerable mercantile importance. The skin is dressed with the fur on, to make caps, &c., or is tanned and used as leather. The oil, when made before decay has begun, is colorless and nearly inodorous; it is much superior to whale-oil. The flesh is much used for food in very northern countries, as is that of all the other species which they produce. It is not easy to shoot a seal. Whilst flint-locks were in use, the S. always dived so quickly on seeing the flash as generally to escape the ball.

The popular name SEA-CALF, and the specific name *vitulina* have reference to a supposed resemblance of the voice to that of a calf.—The HARP S. (*P. Grœnlandica*) receives its popular name

Harp Seal (*Phoca Grœnlandica*), attitude on land.

from a large, black, crescent-shaped mark on each side of the back. It is sometimes seen on the British coasts, but belongs chiefly to more northern regions. It is from 6 to 8 or even 9 feet in length.—THE GREAT S., or BEARDED S. (*P. barbata*), also found on the British coasts, and plentiful on the coasts of Greenland, is generally about 9 or 10 feet long, sometimes more.—The ROUGH or BRISTLED S. (*P. hispida*) frequents quiet bays on the coasts of Greenland, where many thousands are annually killed for their skins and oil. It is the smallest of the northern species.—The GRAY S. (*Halichœrus griseus*), which has a very flat head, and attains a size nearly equal to the Great S., occurs on the British coasts, but is much more common in more northern latitudes, and in the Baltic Sea.—The CRESTED S. (*Stemmatopus cristatus*) is remarkable for the elevation of the septum of the nose of the adult male into a crest, which supports a hood covering the head, and capable of being distended and elevated or depressed at pleasure. The use of this appendage is not known. This S. is plentiful on the coasts of Greenland and the northern parts of North America.—The seals of the southern seas are quite distinct from those of the northern. One of them is the SEA LEOPARD, or LEOPARD S. (*Leptonyx Weddellii*), so called from its spotted fur. It is found on the South Orkneys and other very southern



Common Seal (*P. vitulina*), attitude when swimming.

islands. By far the largest of all the seals is the ELEPHANT S., or Sea Elephant of the southern seas.

Seals are to some extent migratory, although their migrations no not extend to very great distances, and are probably regulated by the abundance or scarcity of food. The time of the return of certain species to certain coasts, is very confidently reckoned upon by the natives of the north and by seal-hunters.

Seal-hunting—or *fishing*, as it is often called—requires great patience and skill. Most of the seals, if not all, are gregarious, and one seems to be always placed on the watch, where danger is to be apprehended from bears or from hunters. They climb up through holes in the ice-fields of the polar seas, even when there is a height of several feet from the water, but it is difficult for the hunter to get between and the hole. Nor is seal-hunting unattended with danger, an enraged S. being a formidable antagonist, at least to the inexperienced.

Seal-hunting is the great occupation of the Greenlanders, but it is also extensively prosecuted in other northern parts of the world, as Newfoundland; whale-fishers kill seals as they find opportunity; and vessels are fitted out expressly for the purpose. The rich fur called the seal-skin of commerce is produced, not by the seals proper, but by some of the otaries (see OTARY).

SEALING-WAX. A composition of hard resinous materials used for receiving and retaining the impressions of seals. Simple as it may appear, its manufacture is one of great importance, and formerly was far more so than at present—the use of gummed envelopes having to a great extent superseded it. Common beeswax was first used in this country and in Europe generally, being mixed with earthy materials to give it consistency. Nevertheless, it was difficult to preserve it, as a very small amount of heat softened it.

The Venetians, however, brought the Indian sealing-wax to Europe, and the Spaniards received it from the Venetians, and made it a very important branch of their commerce. The great value of the Indian wax consisted in the fact that it was made only of shell-lac, colored with vermilion or some other pigment, and this has been found superior to all other materials. In addition to the shell-lac and coloring-material, there is always added to the wax made in Europe a portion of Venetian turpentine (see TURPENTINE), and of resin.

SEA-LION. See OTARY.

SEA-LION, in Heraldry, a monster consisting of the upper part of a lion combined with the tail of a fish.

SEAL ISLANDS, or LOBOS ISLANDS. See PERU.

SEALKOTE, a town in the Punjab, near the left bank of the Chenab, 65 miles north-north-east from Lahore. It contains (1868) 25,337 inhabitants, and carries on the manufacture of paper. S. was formerly a military station, and at the period of the outbreak of the Indian mutiny, there was a rifle-practice dépôt here. All the European troops had been removed in July 1857 to repress disturbances that had broken out elsewhere, and on the 9th of that month the native troops fired on their officers. A considerable number of Europeans were killed, and the survivors suffered great privations until the sepoys, having plundered the station, started off in the direction of Delhi.

SEAL OF CONFESSION. See CONFESSION and CONFIDENTIALITY.

SEAMEN are technically those persons below the rank of officer, who are employed in navigating decked vessels on the high seas—men working on lakes and rivers being usually styled 'watermen.' Two opposite conditions are essential to the well-being of the vessel—first, the absolute subordination and perfect obedience of the crew to the master; and secondly, their protection against tyranny or caprice on his part. For this purpose the law of England is extremely minute in the rules laid down for both masters and seamen.

By an act of 1845, specially levelled against pimps and swindling agents, no person may hire seamen except the owner or master of a ship, and individuals licensed for that purpose by the Board of Trade. Under the Mercantile Marine Act of 1850, a written agreement must be made when a man is engaged, setting forth the nature and length of voyage, the capacity in which the man is to be employed, wages, fines, provisions, punishments, &c. If the ship be going abroad, this agreement must be attested before a shipping-master, who has a power of periodical inspection over the agreements of all seamen in vessels in his port. Any clause in the agreement would be inoperative which deprives the sailor of a lien upon his ship, or of other recovery for his wages, or of rights of salvage. In virtue of this agreement the seaman is bound to do his utmost in the service of the vessel; and consequently, if a master of a ship in distress promise his men extra pay for extraordinary exertions, the men cannot compel him to fulfil his promise.

In the event of disobedience or insubordination the master may administer correction, the law holding him responsible that such correction is reasonable. Desertion from the ship is punishable by imprisonment; and deserters may be apprehended on the information of the master without warrant. In case of open mutiny, the master may adopt the most stringent measures.

The mariner's wages are not due in case of loss of the ship, unless he duly exerted himself, and only up to the date of loss. It is a misdemeanor for the master to leave a sailor on shore in foreign parts, unless through the man's wrongful act.

SEA MOUSE (*Aphrodite*), a genus of dorsibranchiate annelida, of the family *Aphroditidæ*, to all of which the popular name is extended. They are readily distinguished by two longitudinal ranges of broad membranous scales covering the back, under

Sea Mouse (*Aphrodite aculeata*).

which are the gills in the form of little fleshy crests. The scales move up and down as the animal respires; and are concealed by a substance resembling tow or felt, which permits the access of water but excludes mud and sand. The head is furnished with tentacles; some have two eyes and some four. The body is edged with spines. Besides all this, its sides are covered with flexible bristles or silky hairs, which give to these creatures a wonderful beauty of color, unsurpassed by that of humming-birds or the most brilliant gems. Each hair, even when viewed singly, and moved about in the sunshine, reflects all the hues of the rainbow. Yet sea-mice are generally to be found concealed under stones, and dwell amongst the mud at the bottom of the sea. Storms frequently throw them on the beach in great numbers. A very beautiful species, *A. aculeata*, of an oval form, about 6 or 8 inches long, and 2 or 3 broad, is the Common S. M. of the British coasts.

SEA PIKE (*Centropomus undecimalis*), a fish, which, notwithstanding its popular name, belongs to the perch family. Its form, however, is elongated like that of the pike. The body is compressed; there are two dorsal fins; the mouth is not very large; and the teeth are numerous, small and equal. The color is silvery-white, tinged with green on the back. It is found on the western coasts of tropical America. It attains a large size, and is a valuable fish. On the British coasts, the name S. P. is sometimes given to the Garfish.

SEA PINK. See THRIFT.

SEARCH OF ENCUMBRANCES means the inquiry made by a purchaser or mortgagee of lands as to the burdens and state of the title, in order to see whether his purchase or investment is safe. Owing to the want of any general system of registration of deeds affecting land in England, it is not possible by any search to find out with certainty all these burdens; nevertheless, there are some special registers which are usually included in such searches, such as judgment debts, bankruptcies, disentailing deeds, annuity deeds, &c. The search usually goes back for 60 years. In Scotland, where all the deeds affecting land rights are registered, it is easy to discover the exact state of the title and burdens on the land. The usual search is made only for 40 years. The registers are subdivided into various kinds—as the general and particular register of Sasines, the Record of Abbreviates of Adjudications, Register of Inhibitions, &c. See RECORDS.

SEARCH-WARRANT is an authority granted to a constable by a justice of the peace to enter the premises of a person suspected of secreting stolen goods, in order to discover, and if found to seize the goods; and similar warrants are granted to discover property in respect of which other offences are committed. Before such a warrant can be issued, a credible witness must on oath prove a reasonable cause to suspect that the party proceeded against has the property in his possession or in his premises. The name of the person whose premises are to be searched must be correctly described in the warrant.

SEA-SERPENT, the name given to gigantic animals presumedly of serpentine form, which are believed by many naturalists to exist in the sea-depths, especially in tropical oceans. The question of the existence of a sea-serpent has long formed one of the knotty problems of zoological science. But it seems reasonable to conclude that there exists a certain basis for the supposition that undescribed marine forms do exist in the sea-depths, and that the most reliable tales of sea-serpents take origin from appearances of such animals. Of such tales, possessing a warrantable basis of fact, and emanating from authoritative sources, that of Captain M'Quhae is one of the best known. This account was published in 1848. Captain M'Quhae commanded H.M.S. *Dædalus*, and encountered the serpentine form in lat. 24° 44′ S., and long. 9° 20′ E., and therefore in the South Atlantic Ocean, near the Tropic of Capricorn, and not very far from the coast of Africa. It was not, as in other cases, in bright and fine weather, but in dark and cloudy weather, and with a long ocean swell. The animal was swimming rapidly, and with its head and neck above water.

Captain M'Quhae, in his Report to the Admiralty, describes it with confidence as 'an enormous serpent, with head and shoulders kept about 4 feet constantly above the surface of the sea;' and he adds: 'As nearly as we could approximate by comparing it with the length of what our maintopsail-yard would show in the water, there was at the very least 60 feet of the animal *à fleur d'eau*, no portion of which was, to our perception, used in propelling it through the water, either by vertical or horizontal undulation. It passed rapidly, but so close under our lee-quarter, that had it been a man of my acquaintance, I should have easily recognized his features with the naked eye; and it did not, either in approaching the ship or after it had passed our wake, deviate in the slightest degree from its course to the south-west, which it held on at the pace of from 12 to 15 miles per hour, apparently on some determined purpose. The diameter of the serpent was about 15 or 16 inches behind the head, which was, without any doubt, that of a snake; and it was never, during the twenty minutes that it continued in sight of our glasses, once below the surface of the water; its color a dark-brown, with yellowish-white about the throat. It had no fins, but something like the mane of a horse, or rather a bunch of sea-weed, washed about its back.'

Regret has been very naturally expressed that Captain M'Quhae did not bestow a shot on it. Figures prepared from a sketch by him were published in the *Illustrated London News* of 28th October 1848. About the same time, the testimony of another witness, Lieutenant Drummond, appeared, and was found to differ in some important points from the account of the animal given by Captain M'Quhae, and the figures published with his approbation, particularly in ascribing a more elongated form to the head, in the mention of a back-fin, whereas Captain M'Quhae expressly says that no fins were seen; and in a lower estimate of the length of the portion of the animal visible. Lieutenant Drummond's words are: 'The appearance of its head, which, with the back fin, was the only portion of the animal visible, was long, pointed, and flattened at the top, perhaps 10 feet in length; the upper jaw projecting considerably; the fin was, perhaps, 20 feet in the rear of the head, and visible occasionally; the captain also asserted that he saw the tail, or another fin about the same distance behind it; the upper part of the head and shoulders appeared of a dark-brown color, and beneath the under jaw a brownish-white. It pursued a steady and undeviating course, keeping its head horizontal with the water, and in rather a raised position, disappearing occasionally beneath a wave for a very brief interval, and not apparently for the purposes of respiration. It was going at the rate of perhaps from 12 to 14 miles an hour, and when nearest was perhaps 100 yards distant. In fact, it gave one quite the idea of a large snake or eel.' Lieutenant Drummond's account is the more worthy of regard, as it is derived from his log-book, and so gives the exact impressions of the hour, whilst Captain M'Quhae's was written from memory after his arrival in England. Into the discussion which arose concerning this case, it is out of our power to enter.

In 1875, a battle between a sea-serpent and a whale was viewed from the deck of the good ship *Pauline* of London, Captain Drevar, when proceeding with a cargo of coals from Shields to Zanzibar, destined for Her Majesty's ship *London*. When the *Pauline* reached the region of the trade-winds and equatorial currents, she was carried out of her course, and after a severe storm, found

herself off Cape Roque, where several sperm-whales were seen playing about her. While the crew were watching them, they suddenly beheld a sight that filled every man on board with terror. Starting straight from the bosom of the deep, a gigantic serpent rose and wound itself twice in two mighty coils round the largest of the whales, which it proceeded to crush in genuine boa-constrictor fashion. In vain did the hapless whale struggle, lash the water into foam, and even bellow, for all its efforts were as nothing against the supernatural powers of its dreadful adversary; whose strength may be further imagined, from the fact that the ribs of the ill-fated fish were distinctly heard cracking one after the other with a report like that of a small cannon.

Of no less a ship than Her Majesty's yacht the *Osborne*, the captain and officers, in June 1877, forwarded an official Report to the Admiralty containing an account of a sea-serpent's appearance off the coast of Sicily on the 2d of that month. 'The time was five o'clock in the afternoon. The sea was exceptionally smooth, and the officers were provided with good telescopes. The monster had a smooth skin, devoid of scales, a bullet-shaped head, and a face like an alligator. It was of immense length, and along the back was a ridge of fins about *fifteen* feet in length and *six* feet apart. It moved slowly, and was seen by all the ship's officers.'

This account was further supplemented by a sketch, from the pencil of Lieutenant W. P. Hynes of the *Osborne*, who to the above description adds, that the fins were of irregular height, and about forty feet in extent, and 'as we were passing through the water at ten and a half knots, I could only get a view of it "end on."' It was about fifteen or twenty feet broad at the shoulders, with flappers or fins that seemed to have a semi-revolving motion. 'From the top of the head to the part of the back where it became immersed, I should consider about fifty feet, and that seemed about a third of the whole length. All this part was smooth, resembling a seal.'

These instances are but examples of the many cases, in which narratives of the most circumstantial character have been recorded regarding the appearance of serpentine animals, usually in tropical seas.

As will readily be admitted, the chief point at issue is that of the zoological determination of the forms reported to have been seen. Gigantic cuttle-fishes, now proved to have a veritable existence, might in many cases imitate an elongated marine form, swimming near the surface of the sea. Certain fishes, such as the Basking Shark (*Selache maxima*) would also under certain circumstances appear as unusual marine forms; and as Dr. Andrew Wilson, of the Edinburgh Medical School, has pointed out, the well-known Tape-fishes (*Gymnetrus Banksii*) would very accurately reproduce the features of a marine snake, especially when these fishes, as is well-known, are developed to an immense size. The marine snakes or *Hydrophidæ* of the Indian Ocean would also serve to personate the 'great unknown,' if largely developed, and indeed as Dr. Wilson has pointed out, in the idea of the immense development of ordinary marine animals may be found a probable clue to the sea-serpent mystery. Cases of mere serpentine appearances assumed by certain animals are not to be confused with cases in which a single animal has presented a serpentine aspect. Flocks of shags swimming close to the water's edge might personate a sea-serpent swimming along the top of the water (see *Nature*, Sept. 1878); but a flock of birds would have been readily detected by Captain M'Quhae, and by many other observers who have beheld the unknown form from a near distance. The reader who wishes for a full discussion of the scientific aspects of this question may consult a paper entitled 'The Sea-Serpents of Science,' in Dr. Andrew Wilson's volume *Leisure-Time Studies* (Chatto & Windus, London, 1878).

SEA-SHORE, or land bordering on the sea, belongs partly to the crown, and the public have certain rights in relation thereto. The soil or property in the sea-shore is vested in the crown, and the limit on the land side is defined to be the medium line of high-water of all the tides in the course of the year, or the height of the medium tides in each quarter of a lunar revolution during the whole year. But though the crown is *prima facie* the owner of the sea-shore, the owner of the adjoining manor has sometimes a grant of it, and he proves this grant by ancient use—such as gathering sea-weed, &c. The public have a right to walk on that part of the shore vested in the crown, which holds it as a trustee for them. But the public have no right to trespass on the adjacent lands in order to get at the shore, so that it is only where a highway leads to the shore, or the public land from seaward, that the right can be made available. Thus it has been decided that the public have no legal right to trespass on the adjoining lands in order to get to the shore for purpose of bathing. The public have a right to fish on the sea-shore if they get legal access to it, and may take all floating fish, but not oysters or mussels which adhere to the rock, if the soil belongs to an individual. The public have no right to gather sea-weed or shells, though, as regards the latter, it is of so little consequence that nobody prevents them. Nor have fishermen a right to go on that part of the sea-shore which is private property to dig sand for ballast, or to dry their nets, or similar purposes, though in a few cases local customs permitting this have been held valid. In Scotland, the right to the sea-shore is also vested in the crown, but when a crown grant gives land bounded by the sea-shore, this is held to give to the grantee the fore-shore also.

SEA-SICKNESS is a variety of vomiting deserving of special notice. It is often preceded by premonitory symptoms, which appear almost immediately after a susceptible person is exposed to the motion of rolling water in a vessel or boat, and are as distressing as the vomiting itself. Amongst these symptoms may be mentioned vertigo and headache, with a peculiar feeling of sinking and distress about the pit of the stomach. Vomiting, however, in general, soon comes on, accompanied with convulsive heaving of the stomach, and such an indescribable feeling of prostration as to render the patient utterly regardless of what is going on around him, and almost indifferent to life. Moreover, a deadly pallor, a profuse cold sweat, and diarrhœa, are more or less commonly present. The susceptibility to this troublesome affection varies extremely in different persons. Some never suffer from it, others only on their first voyage, and others, again, in every voyage they undertake; with some it continues but a few hours, while others suffer almost continuously throughout a long voyage. In the great majority of cases, the sickness disappears in a few days, unless the weather be very boisterous. It almost always ceases on landing, although more or less giddiness may prevail for some hours, the patient when walking, feeling as if the earth were rising up under his feet. Infants and aged persons are supposed to possess a comparative immunity from sea-sickness, while, as a general rule, women suffer more than men.

According to Dr. Althaus, persons with a strong heart and a slow pulse generally suffer little from sea-sickness; while irritable people, with a quick pulse and a tendency to palpitation, are more liable to be affected; and he thus accounts for different liability of different nations to this affection; 'for, as a rule, the French and Italians, being of a more irritable temper, suffer most from the disorder, the Germans less, and the English least. ('On Sea-sickness as a form of Hyperæsthesia,' in *Proceedings of the Medico-Chirurgical Society*, vol. v. p. 23.)

The primary cause (or rather condition) of sea-sickness is the motion of the ship; and the *pitching* of a vessel, or alternate rising and falling of the bow and stern, is especially apt to produce it. It is less felt in large and heaviiy ballasted vessels, because the movements referred to are least perceptible in them. How this cause operates is a subject regarding which there has been much discussion; and without entering into the history of the views of different physicians on this subject, we may give as widely accepted that of Dr. Chapman, who holds that the motions of the vessel cause the accumulation of an undue amount of 'blood in the nervous centers along the back, and especially in those segments of the spinal cord related to the stomach, and the muscles concerned in vomiting.'

This condition is induced, as he maintains, in three different ways, viz., (1.) by the movements of the brain, which are much greater in a pitching vessel than on land; (2.) by the corresponding movements of the spinal cord; and (3.) by the excessive movements of the viscera within the abdominal and pelvic cavities. In one person the brain may be mainly responsible in causing that preternatural afflux of blood in the spinal cord, on which (according to Dr. Chapman's hypothesis) sea-sickness depends; in another, the spinal cord may be the main agent; and in a third, the abdominal viscera; although each is always concurrent in some degree. Hence, the only scientific and really effective remedy for this disorder, must be one which has the power of lessening the amount of blood in the whole of the nervous centers along the back, and this can be done by lowering the temperature of the spinal region by the local application of ice. For a description of Dr. Chapman's 'spinal ice-bags' (which may be obtained from any respectable surgical instrument-maker), and for the method of applying them, we must refer to his work *On Sea-sickness; its Nature and Treatment*, p. 37 (Lond. 1864). He gives the details of 17 cases in which the ice-bags were of greater or less benefit; in most of the cases, the result was perfectly successful. Besides Dr. Chapman's evidence we have that of Captain White, commander of one of the Newhaven and Dieppe boats, who states that 'in ordinary weather it [Dr. Chapman's remedy] is a success. I had some difficulty in persuading passengers to try it, but those who did were benefited.'

Mr. Bradley, surgeon in the Cunard Service, in a letter to *The Lancet*, December 3, 1864, writes as follows: 'I have tried this remedy *in severe cases when other remedies have failed* (chloroform, iced champagne, effervescing draughts, fresh air, &c.), and have very generally found it do great good. In no case does it do harm, but in the great majority of instances it soothes the nervous irritability which so commonly accompanies severe sea-sickness,

induces sleep, and consequently relieves exhaustion.' We are permitted to publish the following extract of a letter from Dr. Hayle of Rochdale, to Dr. Chapman, dated June 3, 1865: 'I recommended a patient about to cross the Atlantic, to try one of your ice-bags for sea-sickness. The result was most satisfactory. He was never sick when wearing the bag. Once he went without it, and then, and then only, was he sick. His friend, who had no ice-bag, was frequently sick.' As an ancillary remedy the drinking of iced water, or the swallowing of small lumps of ice, may be recommended. Dr. Chapman prefers the ice, which, 'brought in contact with the peripheral ends of the nerves of the stomach, will act on the same principle as it does when applied to the spinal region.'

Those who are susceptible to this distressing affection, and have not the opportunity of trying the ice-bags, may, at all events, diminish the severity of the vomiting by assuming, and as long as possible retaining, the horizontal position, as nearly as possible in the center of the ship's movement, and keeping the eyes closed. The compression of the abdomen, by means of a broad tight belt, sometimes gives relief. A few drops of chloroform on a lump of white sugar will sometimes check the tendency to vomiting in persons who only suffer slightly. A little arrowroot, flavored with brandy or sherry, is usually a kind of food that will most easily remain on the stomach, when the severity of the symptoms is abating. Dr. Wood, one of the most eminent of the American physicians of the present day, asserts that he has found 'nothing under such circumstances so acceptable to the stomach as raw salt oysters.'

SEASIDE GRAPE (*Coccoloba uvifera*), a small tree, of the natural order *Polygoneæ*, a native of the West Indies. It grows on the sea-coasts; has orbicular, cordate, leathery, shining, entire leaves, and a pleasant, subacid, eatable fruit, somewhat resembling a currant, formed of the pulpy calyx investing a bony nut. The extract of the wood is extremely astringent, and is sometimes called JAMAICA KINO. The wood itself is heavy, hard, durable, and beautifully veined.

SEA SLUG. See HOLOTHURIA.

SEASONING, a term in Cookery for the materials used to add flavor to food. They are chiefly salt, the spices, and pot-herbs. Salt is the most important, for it not only increases the sapidity of most kinds of food, but also adds to their wholesomeness.

SEASONS. In the article EARTH, the motions of the earth on which the changes of the seasons ultimately depend, are explained. The chief cause of the greater heat of summer and cold of winter is that the rays of the sun fall more obliquely on the earth in the latter season than in the former. See CLIMATE. Another concurrent cause is the greater length of the day in summer, and of the night in winter. Within the tropics, the sun's rays have at no time so much obliquity as to make one part of the year very sensibly colder than another. There are therefore either no marked seasons, or they have other causes altogether, and are distinguished as the *Wet* and *Dry* seasons. This is explained in the article RAIN. But in all the temperate parts of the globe, the year is naturally divided into four seasons—*Spring*, *Summer*, *Autumn*, and *Winter*. In the arctic and antarctic regions, spring and autumn are very brief, and the natural division of the year is simply into summer and winter, the winter being long, and the summer short; and this is very much the case also in regions of the temperate zones lying near the arctic and antarctic circles.

In subtropical regions, the distinction of four seasons is, in like manner, very imperfectly marked. This distinction is everywhere arbitrary as to the periods of the year included in each season, which really vary according to latitude; and partly according to the other causes which influence climate; the seasons passing one into another more or less gradually, and their commencement and close not being determined by precise astronomical or other phenomena. The greatest heat of summer is never reached till a considerable time after the summer solstice, when the sun's rays are most nearly vertical, and the day is longest; the greatest cold of winter is in like manner after the winter solstice, when the day is shortest, and the sun's rays are most oblique; the reason in the former case being, that as summer advances the earth itself becomes more heated by the continued action of the sun's rays; in the latter, that it retains a portion of the heat which it has imbibed during summer, just as the warmest part of the day is somewhat after midday, and the coldest part of the night is towards morning. The four seasons of temperate regions are distinguished by the phenomena of nature which characterize them, and which are of the greatest importance in relation to the wants and labors of man. But the renewal of vegetative activity in spring is not to be ascribed entirely to the increasing warmth of the sun's rays. Plants are so constituted that a period of rest is followed by new activity, and this new activity very generally begins in the fresh circulation of sap and enlargement of buds, whilst the cold of winter still continues unabated, or before it has reached its greatest intensity. A similar remark may be made with regard to some of the phenomena of animal life, which may as well be said to herald the approach of spring as to attend its first days of genial weather.

SEBASTIAN, SAINT, a very celebrated martyr of the early church, whose memory is venerated in both branches of the church, east as well as west (although the scene of his martyrdom was the city of Rome), and whose story has formed one of the most popular themes of Christian artists from the earliest times. His history is contained in the so-called acts of his martyrdom, which, although partaking of the legendary tone, are regarded as authentic, not only by Baronius and the Bollandists, but also by Tillemont and others of the more stringently critical schools of ecclesiastical history. S., according to this narrative, was born at Narbonne and educated at Milan. Although a Christian, he entered the Roman army, without, however, revealing his religion, and with the view of being enabled, by his position, to assist and protect the Christians in the persecution. In this way he supported and comforted many of the martyrs in Rome; and he even converted Nicostratus, the keeper of the prison in which the martyrs were confined, and his wife, Zoe, to whom he miraculously restored the use of her speech, after she had been dumb for six years. Still unrecognized as a Christian, S. rose to high favor under Diocletian, while at the same time the grateful pontiff, Caius, named him 'Defender of the Church.' At length came the time for his open profession of his faith.

Diocletian used every effort to induce him to renounce the Christian creed, but in vain; and in the end he was condemned to be put to death by a troop of Mauritanian archers, who transfixed him with numberless arrows, and left him as dead. But a Christian lady, Irene, finding that life was not extinct, had the body removed to her house, where life was restored; and although the Christian community desired to conceal his recovery, S. again appeared in public before the emperor, to profess his faith in Christianity. Diocletian condemned him to be beaten to death with clubs in the amphitheater; and his body was flung into one of the sewers of the city, in which it was discovered, according to the Acts of Martyrdom, by means of an apparition, and carried by a Christian lady, Lucina, to the catacomb, which is still called by his name. The date of his martyrdom was January 20, 288. By the Greeks the feast is held on the 20th December. The festival was celebrated with great solemnity in Milan as early as the time of St. Ambrose; and it was observed in the African Church in the 4th century. There is another saint of the same name, who is said to have suffered martyrdom in Armenia.

SEBASTIANI, FRANCOIS-HORACE-BASTION, marshal of France, was born November 10, 1772, at Porta d'Ampugnano, a village near Bastia, in Corsica. He was the son of a tailor, but his extreme vanity led him to declare himself of noble descent and a distant relative of the Bonapartes. He entered the army as a sub-lieutenant of infantry, August 27, 1789. His rise, due to his bravery in the field, was no doubt somewhat aided by his splendid physique, graceful manner, and facile diction. He became *chef-d'escadron* in 1797, and brigadier in 1799, and was one of Napoleon's most devoted partisans. He fought at Marengo, executed some important diplomatic service in Turkey in 1802—1803, after which he became general of brigade (August 1803), and was wounded at Austerlitz. On May 2, 1806, he was again deputed to Turkey, this time to break the alliance of the Porte with Russia and England; and before he had been seven months at Constantinople, his mission had obtained complete success, and war was declared. The English fleet forced a passage through the Dardanelles, and cast anchor before Constantinople, their presence causing such terror among the sultan's ministers that a total reversal of foreign policy was imminent, but S. coming to the rescue, revived with his seducing eloquence their failing resolution, and assuming an authoritative superintendence of the preparations for defending the coast, put the batteries in a state fit for action.

In five days, he had the coast batteries manned with 600 guns. 100 small gunboats afloat, a line of vessels laid along shore, each with a broadside ready to be discharged on the English fleet, which at last gallantly ran the gantlet, losing two ships and 700 men. But the death of the sultan, and the treaty of Tilsit, put an end to the French intrigues in Turkey, and S. was recalled June 1807, and decorated with the grand cordon of the Legion of Honor. He subsequently commanded the fourth corps-d'armée in Spain. He distinguished himself in the Russian campaign of 1812, and at Leipzig. On the exile of Napoleon to Elba, he gave in his adherence to the Bourbon government, but joined his old master on his return. After the revolution of 1830, he held for brief periods the portfolios of naval (1830) and foreign affairs, and the embassies to Naples (April 1833) and London (January 1835); but was more distinguished for his elegance, and graceful de-

meanor in the Parisian salons, than as a politician or administrator. He died at Paris, July 20, 1851.

SEBASTIANI'STAS, the name given in Portugal and Brazil to persons who believe in the future return to earth of the king Dom Sebastian, who fell in the battle of Alcazarquebir, 1578 A.D., while leading on his army against the Moors. This belief has continued to be entertained by many in Portugal; but the S. are said to be now most numerous in Brazil. On the return of Dom Sebastian, they expect Brazil to enjoy the most perfect prosperity and happiness.

SEBASTO'POL, or, as it is sometimes written, in accordance with modern Greek pronunciation, SEVASTOPOL (*Sebastopolis*, the 'august city'), a Russian seaport, fortress, and arsenal in the Crimea, in the government of Taurida. It is situated near the south-west extremity of the Crimea, on the southern side of the magnificent harbor or roadstead of S., one of the finest natural harbors in the world. This harbor is an inlet of the Black Sea, stretching inland for about four and a half miles from west to east, about half a mile wide at the entrance, but immediately opening out to the width of a mile, with an average width of about half a mile up to the eastern end. It is sheltered on the north and south by lofty limestone ridges shutting it completely in, with a depth of water varying from 3 to 11 fathoms, and sufficient in several places to allow ships of the largest size to lie close to the shore. At the eastern end, under the heights of Inkermann, the river Tchernaya enters the harbor through low marshy ground. The South Bay, or Dockyard Harbor, as it is also called, extending about one and a half miles from north to south, forms the harbor proper of S.; and between it and Quarantine Bay, occupying rather more than half the peninsula thus formed, is built the chief portion of the town of S., on ground sloping irregularly upwards. The town previous to its destruction in the siege of 1854—1855, was well and substantially built of stone, with lines of streets running from north to south, and smaller ones intersecting them at right angles, containing several handsome public edifices.

The docks, constructed for the Russian government by Colonel Upton, an English civil engineer, were among the most important works at S.; the dock basin, docks, and quays were formed in the most substantial way, being partly cut in the solid rock, and lined with cement, partly built of limestone and granite. From the Dockyard Creek, ships were admitted into the Dock Basin by means of three locks, the bottom of the docks being above the sea-level, and the basin was supplied with water by a canal some 12 miles in length from the Tchernaya above Inkermann—itself a work of no inconsiderable magnitude. For the defence of town and harbor from attack by sea, several forts were erected. These forts were works of immense strength, built of limestone faced with granite, on which artillery was found to make but little impression; they mounted a very large number of guns, and by their cross-fire completely protected every spot accessible to a hostile fleet. On the land side, with the exception of a slight loopholed wall extending partially round the western side, the town, previous to the siege, was entirely undefended; but the earthworks and fortifications then successively extemporized by the genius of General Todleben, which for so many months kept the armies of France and England at bay, and of which the Malakoff and the Redan were the most formidable, are now of historic fame.

The siege of S. by the allied English and French armies will rank among the most famous sieges in history; it lasted for 11 months, from October 1854 to September 1855; the place sustained repeated bombardments, the first of which took place October 17, 1854; and the capture of the Malakoff and Redan, on September 8, 1855, at length forced the Russians to evacuate it, and retired to the north side. The town was completely ruined; the docks and forts still standing were blown up by French and English engineers, and by the treaty of Paris (1856) were not to be restored; but the restrictions were removed by the abrogation of the neutrality of the Black Sea by the Conference of London (1871). Before the siege, the population of S., including the garrison, amounted to about 40,000. Since, the town has been partially rebuilt, but the population in 1880 was only 15,000. S. was intended to be the station of the Russian Black Sea fleet, and as such to form a standing menace to Turkey; during the siege, the fleet was almost entirely destroyed, many of the ships having been sunk by the Russians across the entrance of the harbor by way of defence. The great disadvantage of S. as a naval station arises from the ravages of the *Teredo navalis*, which soon render wooden vessels unseaworthy.

S. was founded on the site of a small Tartar village called *Akhtiar*, immediately after the Russian conquest of the Crimea in 1783, under the orders of the empress Catharine II. The promontory on which S. stands is a spot of considerable classical and historical interest. Here, perhaps on the site now occupied by the Greek convent of St. George, west of Balaclava, stood the temple of the Tauric Artemis, in which, according to the legend, Iphigenia, daughter of Agamemnon was priestess. In later times the promontory was colonized by Greeks from Heraclea, in Asia Minor, and became known as the Heracleotic Chersonese. Two cities, successively built a few miles apart on the sea-coast to the west of S. have left remains existing to the present day. In after times, the Chersonesus fell into the power of the Genoese, who established their headquarters at Balaclava, where the remains of the 'Genoese castles' on the heights still bear witness to their rule. See Kinglake's *Invasion of the Crimea*.

SEBE'NICO, a small port on the coast of Dalmatia, 42 miles south-east of Zara. It is built on a steep slope, and rises in terraces, and was formerly defended by walls and towers. Its cathedral, a fine edifice with a bold dome, was built 1443—1536. Its excellent harbor is defended by several forts. Pop. (1880) 6876; of commune, 18,104.

SEBE'STEN, SEBESTAN, SEPISTAN, or S. PLUM, the fruit of the *Cordia Myxa*, a tree of the natural order *Cordiaceæ*, a native of the East Indies. The tree has ovate leaves, and an egg-shaped fruit, which is succulent, mucilaginous, and emollient, with some astringency, and was formerly an article of the European Materia Medica, being employed for the preparation of a lenitive electuary and of a pectoral medicine. It is believed to be the *Persea* of Dioscorides. It has a sweetish taste, and is eaten by the natives of the Northern Circars of India, where it grows.

SE'CANT. See TRIGONOMETRY.

SECE'DERS AND SECESSION KIRK. See UNITED PRESBYTERIAN CHURCH.

SECLU'SION (of the insane). This term has recently been narrowed so as to apply to the removal of the violent insane from the ordinary wards and fellowship of an asylum to an airing court, gallery, or room so situate and furnished that its solitary occupant can neither injure himself, nor injure nor disturb others. Since the abolition of physical restraint by chains and straitjackets, seclusion has become a favored and useful mode of repression and treatment. That it should be resorted to exclusively as a remedial agent, and by the medical attendant, are now received as axioms.

In 1854, the Commissioners in Lunacy in England ascertained, by circular, the opinions of almost all those intrusted with the care of the insane in that country, as to the employment of such means of cure; when it appeared that it was generally considered beneficial, if used for short periods and during paroxysms of epileptic and violent mania. Even when not absolutely required for the tranquillization of the individual, seclusion may become expedient in order to secure the quiet, comfort, or safety of the patients with whom he is associated. That such an instrument may be abused and adopted from the parsimony, timidity, or ignorance of those around, is obvious. One of the lunatics liberated by Pinel, in 1792, had been incarcerated or *secluded* in his dark cell for forty years; and occasionally even now the duration of the isolation may be unduly prolonged even under medical sanction; but the instances of gross and cruel seclusion in garrets and cellars, and outhouses, are now chiefly to be found in private families, and where, as in the 'Flushing case,' no better course is known to be practicable.—*Eighth Report of Commissioners in Lunacy to Lord Chancellor*, App. C, p. 123; Bucknill and Tuke, *Psychological Medicine*, p. 562; Browne, *What Asylums Were, Are, and Ought to be*, p. 137.

SECOND (for the derivation of which see SCRUPLE) is the sixtieth part of a minute, whether of time or of angular magnitude. See MINUTE. In old treatises we find seconds distinguished as *minutæ secundæ*, from minutes, or *minutæ primæ*. The sixtieth part of a second was called a third, but instead of this and succeeding subdivisions, decimal fractions of seconds are now employed.

SE'CONDARY, in Geology, is the designation given to that large section of the fossiliferous strata which includes the Triassic, Oolitic, and Cretaceous rocks. It is synonymous with Mesozoic. The strata grouped under this title are separated from the inferior and superior deposits more by their organic contents than their petrological structure, and this separation is more evident between them and the older rocks, than between them and the newer; and yet recent discoveries have shown that the St. Cassian Beds form a connecting link between the Permian and Triassic epochs. They contain a series of fossils which are partly Palæozoic and partly Mesozoic in their facies.

The appearance of the great types of all subsequent organisms in the Secondary rocks, has suggested the grouping of the fossiliferous strata in respect of their fossils into only two great divisions—viz., the Palæozoic and the Neozoic—this last term including the Secondary and Tertiary periods.

SECONDING is a temporary retirement to which officers of Royal Artillery and Royal Engineers are subjected when they accept

civil employment under the crown. After six months of such employment the officer is seconded, by which he loses military pay, but retains his rank, seniority, and promotion in his corps. After being seconded for ten years, he must elect to return to military duty or to retire altogether.

SECOND SIGHT, a superstition or belief once common in the Scottish Highlands and Isles, where it is known by the Gaelic appellation *Taibhsearachd*, signifying a spectral or shadowy appearance. Certain persons, called seers or wizards, were supposed to possess a supernatural gift, by which they involuntarily foresaw future events, and perceived distant objects as if they were present:

> As the sun,
> Ere it is risen, sometimes paints its image
> In the atmosphere, so often do the spirits
> Of great events stride on before the events,
> And in to-day already walks to-morrow.
>
> WALLENSTEIN.

This is to depict the lofty and poetical view of the subject, as illustrated in classic fable and early history. The Highland seer, however, was chiefly conversant with the scenes and occurrences of ordinary life. 'A man on a journey far from home falls from a horse; another who is perhaps at work about the house, sees him bleeding on the ground, commonly with a landscape of the place where the accident befalls him. Another seer, driving home his cattle, or wandering in idleness, or musing in the sunshine, is suddenly surprised by the appearance of a bridal ceremony or funeral procession, and counts the mourners or attendants, of whom, if he knows them, he relates the names, if he knows them not he can describe the dresses. Things distant are seen at the instant when they happen' (Johnson's *Journey to the Hebrides*).

With respect to things future, Johnson thought there was no rule for determining the time between the sight and the event; but Martin, whose account of the Western Islands was first published in 1703, furnishes data of this kind in his classification of the visions. If an object was seen early in the morning, the event would be accomplished a few hours afterwards; if at noon, the same day; and if at night, the accomplishment would take place weeks, months, and sometimes years afterwards, according to the time of night the vision was beheld. The appearance of a shroud was an infallible prognostic of death, and the nearness or remoteness of the event was judged by the amount of the body that was covered by the ghastly sheet; if it was not seen above the middle, a delay of a twelvemonth might be hoped for, but if it ascended high towards the head, the mortal hour was close at hand. 'The vision makes such a lively impression upon the seers,' says Martin, 'that they neither see nor think of anything else except the vision, as long as it continues; the eyelids of the seer are erected, and the eyes continue staring until the object vanish.' The power of the seer was involuntary and painful—it was no source of gain. The gradation of symbolical appearances we have mentioned, strikes the imagination and gives something like a system to the supernatural phenomena. But if we turn to the cases described by the historians of the second sight, we do not find such regular order and exactness. The evidence is vague and confused, and the incidents are often of the most trivial character. The revelations, indeed, were commonly made to poor illiterate men, predisposed from the very nature of the country—wild, dreary, and remote—and from their half-idle, solitary life, to melancholy and superstition. These causes must have led very early to belief in the second sight.

We find it coloring portions of the story of Wallace and Bruce, and associated with the tragic fate of the accomplished James I. of Scotland. A Scottish seer is said to have foretold the unhappy career of Charles I., and another the violent death of Villiers, Duke of Buckingham. In 1652, a Scottish lawyer, Sir George Mackenzie, afterwards Lord Tarbat, when driven to the Highlands by fear of the government of Cromwell, engaged himself in making inquiries concerning this supposed supernatural faculty, and wrote a minute account of its manifestations addressed to the celebrated Robert Boyle, which, with other relations on the same subject, is published in the correspondence of Samuel Pepys. Next came Martin's copious description; then a Highland minister, the Rev. John Fraser of Tyree, collected *Authentic Instances*, which were printed in 1707; and in 1763, appeared the ambitious treatise of *Theophilus Insulanus*, or MacLeod of Hamir, which contained the narratives of Fraser, of Aubrey the English antiquary, and other authorities, with the addition of a great number of cases—nearly a hundred—gathered by himself from various sources, and also numerous letters from Highland ministers. This work exhausted the subject, but the wretched vanity, credulity, and weakness of Theophilus covered it with ridicule. A fresh revival took place after the memorable *Journey to the Hebrides* by Dr. Johnson, whose work was published in 1775. The second sight was sure to interest a melancholy, meditative 'rambler' like Johnson. He had read of it in his youth in Martin's History. He was naturally superstitious. He had a stout courageous heart and strong nerves in all mundane matters and positions, but he had a morbid fear of death, and an almost childish eagerness to pierce the darkness of futurity, and to believe in the possibility of messages from the other world.

Johnson anxiously questioned the clergy and others respecting the supernatural communications made to the seers, and would gladly have believed them real. The evidence, however, was not complete or invincible; and with that love of truth, which was one of the strongest virtues of the sage of Bolt Court, he confessed that he never could 'advance his curiosity to conviction, but came away at last only willing to believe.' On one occasion we find Johnson enunciating the true doctrine in such cases. He observed, as Boswell reports, that 'we could have no certainty of the truth of supernatural appearances unless something was told us which we could not know by ordinary means, or something done which could not be done but by supernatural power; that Pharaoh, in reason and justice, required such evidence from Moses; nay, that our Savior said: "If I had not done among them the works which none other man did, they had not had sin."' Undoubtedly works or facts, not merely appearances, are required for conviction. Spectral sights may be caused by dreams or disease (see APPARITIONS), by accidental optical illusions, or by the workings of a vivid imagination. It seems degrading to the idea of divine power to suppose that special miracles were wrought to announce the marriage or death of a Highland peasant, the wreck of a boat, or the arrival of a stranger in a remote island of the Hebrides.

Ignorance is a great ally of superstition, as solitude is of gloomy egotism and melancholy; and since education has penetrated into the Highlands and Isles, and intercourse with other parts of the kingdom has been facilitated by increasing trade and improved means of communication—to say nothing of the effects of that passion for Highland scenery and sport which every year takes crowds of visitors to the country—the belief in second sight, as in astrology and witchcraft, has almost wholly disappeared from the land. It never had the cruel, hard, and revolting features of witchcraft—formerly prevalent in the Lowlands when scarcely known in the Hebrides—and it still seems picturesque enough to serve for the purposes of poetry and romance.

SECRET (Lat. *secreta*, i. e., *oratio*, the secret prayer), one of the prayers of the Mass (q. v.), of the same general form with the 'Collect,' but recited by the priest in so low a voice as not to be heard by the people, whence the name *secreta* is derived. It follows immediately after the oblation of the Eucharistic bread and wine. This use of silent prayer in the public service is one of the subjects of controversy between Catholics and Protestants.

SECRET, DISCIPLINE OF THE (Lat. *Arcani Disciplina*), a discipline of the early church, founded upon the words of Christ, 'Give not that which is holy to dogs,' Matt. vii. 6, in virtue of which Christians fully initiated in the doctrine and practice of the church withheld from pagans and catechumens in the preparatory stage the knowledge of certain doctrines, and the liberty of presence at certain rites connected with the most solemn mysteries of the Christian religion. This practice originated in the obloquy which was drawn upon the doctrines of the church from the false and monstrous conceptions of these doctrines which were circulated among pagans. Against these calumnious misconceptions the earliest of the so-called 'Apologies' are addressed; and it seems certain that at the time at which Justin wrote his first Apology, the middle of the 2d c., no objection existed against speaking openly of the mystery of the Eucharist.—(See *Justini Apol.*, i. 66). Very soon after this, however, the 'Secret' is clearly traceable. The first reason for its adoption was that assigned above—namely, to guard the more sacred and mysterious doctrines from popular misconception and blasphemy among the pagans. This precaution of concealment was extended to catechumens, partly in order to avoid shocking too suddenly their half-formed convictions by the more startling improbabilities of Christian belief; partly also, no doubt, to guard against the danger of the betrayal of these mysterious doctrines to pagan spies approaching in the false garb of catechumens.

The Discipline of the Secret appears in several forms—(1.) Both unbelievers and catechumens were removed from the church at the commencement of that portion of the liturgy which specially relates to the celebration of the Eucharist—the so-called *Missa Fidelium*. See MASS. (2.) The lectures addressed by the presiding teacher to the great body of the catechumens in general were confined to the general doctrines of Christianity. The more mysterious doctrines, those which regarded the sacraments of Baptism and the Eucharist, called 'Mystagogic,' were only communicated at the close, and to those only who had undergone the preliminary probation. (3.) The Eucharist, if referred to at all in the presence of the uninitiated, was spoken of in words so conceived as to conceal its nature. Many curious examples of this concealment might be cited. Origen, alluding to the Eucharist (Hom. 8, in Exod. 4), says merely: 'The initiated know what I mean.' When Chrys-

ostom was writing to Pope Innocent I. an account of a tumult in the church at Constantinople, in which the sacred cup was overset, and the consecrated elements spilled, he says, without reserve, 'The blood of Christ was spilled.' But Palladius, the deacon, in his Life of Chrysostom, which was designed for the pagans as well as for the Christians, takes the precaution to use the words, 'The symbols which are known to the faithful.' Still more curiously, Epiphanius, in citing the well-known words of the Eucharistic formula, 'This is my body,' suppresses the word under which the mysterious idea is contained, and writes, 'This is my *that thing*.' *Touto mou esti tode*. A very curious example of this amphibological language regarding the Eucharist will be seen in a Greek inscription discovered some years since at Autun, in France.—(See *Edin. Rev.*, July 1864).

There is some uncertainty as to the period during which this discipline lasted in the church. It commenced most probably in the time of Justin, as his contemporary, the heretic Marcion, is known to have protested against it as an innovation (Neander's *Kirchen-geschichte*, i. 540). It is even thought not impossible by some that Justin's mode of writing was an exceptional one, and that the Secret may have been in use before his time. On the other hand, it is certain that it outlived the period out of the condition of which it arose, and was maintained long after the ages of persecution. The traces of it had not entirely disappeared in the 6th century.—(See Schelstrate, *Diss. de Discip. Arcani*, 1685; Scholliner, *Diss. de Discip. Arcani*, 1756; and on the Protestant side, Tenzel, *De Discip. Arcani* (in reply to Schelstrate); Rothe *De Disc. Arcani*. Heidelberg, 1831).

SE'CRETARY, SECRETARY FALCON, SECRETARY BIRD, or SERPENT-EATER (*Gypogeranus*), a genus of birds of prey, which has been variously placed by naturalists among the *Falconidæ* and the *Vulturidæ*, and has been also constituted into a distinct family, *Gypogeranidæ*. The legs are very long, as in the

Secretary Bird (*Serpentarius secretarius*).

Grallæ, to which, however, there is no other resemblance. The *tibiæ* are completely feathered, but the *tarsi* and toes are destitute of feathers. The tarsi are covered in front with long, large scales. The toes are armed with sharp claws; but they are short, and the feet are not formed for grasping. The hind-toe is very short. The neck is much longer, and the whole form of the bird more slender than in the Falconidæ. The wings are long, and armed with a blunt spur at the shoulder. The tail is very long. The best-known species is an inhabitant of the arid plains of South Africa. It is about three feet in length; the plumage bluish gray. It has an occipital crest of feathers without barbs at the base, which can be raised or depressed at pleasure, and the name Secretary was given to it by the colonists at the Cape of Good Hope from their fancied resemblance to pens stuck behind the ear. It feeds chiefly on reptiles of all kinds, which it devours in great numbers, and is so highly valued on account of the constant war which it wages against serpents, that a fine is inflicted in the Cape Colony for shooting it. It fearlessly attacks the most venomous serpents, stunning them with blows of its wing, also seizing and carrying them into the air to such a height that they are killed by the fall. It uses its feet also to overpower its prey, striking violent blows with them. Small serpents are swallowed entire; the larger ones are torn to pieces.

The S. is most frequently seen in pairs, or solitary. It is tamed as a protector of poultry-yards; but if not sufficiently fed, is apt to help itself to a chicken or duckling. An attempt has been made to introduce this bird into Martinique, in order to reduce the number of venomous serpents in that island.—Another species of S. appears to exist in more northern parts of Africa, as about the Gambia; and a third, more widely different, in the Philippine Islands.

SECRETARY OF THE NAVY is the conventional title of the parliamentary secretary to the Board of Admiralty. This post is conferred on a ministerial supporter, in the House of Commons, in which, when the First Lord of the Admiralty is a peer, he is the exponent of naval policy. He changes of course with the ministry, of which he is a subordinate member; and receives a salary of £2000 a year. There is also a permanent secretary, who holds office for life, and receives £1700 a year. He is responsible for the discipline of the Admiralty Office. This appointment is of long standing, and was held by the celebrated Mr. Secretary Pepys.

SECRETARY-AT-WAR, formerly a high officer of the British ministry, had the control of the financial arrangements of the army, and was the responsible medium for parliamentary supervision in military affairs. In the times of the Tudors, the war business of the country appears to have been transacted by the department of the Secretary of State. The formation of a war office proper took place about 1620. The office rose in importance as the army increased; but was limited to financial authority, neither the commander-in-chief nor master-general of the ordnance being subject to it. At length, during the Russian war, the evils of this divided authority led to the creation of a Secretary of State for War, to control all the military departments. The secretaryship-at-war was merged in this superior office in 1855, and though for some years preserved technically as a separate appointment held by the Secretary of State, was abolished by act of parliament in 1863.

SECRETARY OF EMBASSY, or of LEGATION, the principal of the persons belonging to the suite of an ambassador or envoy. Secretaries of Embassy or Legation hold their commission immediately from the sovereign, who nominates them in general only to ministers of the first and second rank. They are therefore considered a species of public minister; and independently of their attachment to an ambassador's suite, they enjoy in their own name all the privileges and protections of the diplomatic character. They are generally presented in person to the foreign sovereign at whose court they are accredited. The functions of a secretary of embassy or legation consist principally in assisting the chief in the business of the embassy. Moser (*Versuch Th.* iii. p. 94) says: 'An ambassador is often only like the hands of a watch, while his secretary resembles the works.' Secretaries of embassy and legation occupy the post of ambassadors and envoys during the absence of their ministers. A secretary of embassy or legation must not be confounded with the private secretary of an ambassador appointed and paid by him, who has none of the privileges and immunities above mentioned.

SECRETARY OF STATE, an ancient and important office in the government of England. The oldest record of its existence is in the reign of Henry III., when John Maunsell is described as 'secretarius noster.' Prior to the Restoration, the holder of this office was generally styled the 'king's chief' or 'principal secretary;' he had the custody of the king's signet, and discharged his duties with the assistance of four clerks. Two secretaries are said to have been first appointed towards the close of the reign of Henry VIII. The office, always one of influence, gradually grew in importance. On the Union of 1707, Anne added a third secretary of state for Scotland, which office, however, was soon done away with. In the reign of George III. there were at first but two secretaries; for a time there was a third for America, but his office was abolished by statute in 1782. While the secretaries were two in number, both equally directed home affairs; to the one were committed the foreign affairs of the northern, to the other of the southern department. Irish affairs belonged to the province of the elder secretary.

There are now five principal secretaries of state, who are respectively appointed for home affairs, foreign affairs, war, the colonies, and India. They are all appointed by the sovereign by the mere delivery of the seals of office, without patent, and are always members of the Privy Council and of the Cabinet. Though each has his own department, he is considered capable of discharging the duties of the others; a member of the House of Commons, if removed from one secretaryship to another, does not thereby vacate his seat.

The Secretary of State for the Home Department has the charge of the maintenance of the internal peace of the United Kingdom, the security of the laws, and the administration of justice, so far as the royal prerogative is involved in it. He directs the disposal and employment of the regular troops at home, and provides for the suppression of riots. The militia, yeomanry, and volunteers are entirely under his control. He has the ultimate supervision of all that relates to prisons and criminals; and numerous statutory powers have been given him regarding police, sanitary matters, the regulation of labor, &c. All patents, licenses, dispensations, charters of incorporation, commissions of the peace and of inquiry, pass through his office. He recommends persons to the Sovereign for civil knighthood, and is

empowered to grant certificates of Naturalization (q. v.) to foreigners. He is the organ of communication between the cabinet and the viceregal government of Ireland, for which he is responsible, and is informed of and advises all the graver measures adopted in that country. His patronage is very considerable, including the nomination to a large number of judicial offices. Among the powers of the Secretary of State is that of committing persons on suspicion of treason, a function which, though its legality has been called in question, has been often exercised.

The Secretary of State for Foreign Affairs is the responsible adviser of the crown in all communications between the government and foreign powers. He negotiates treaties, either directly with the foreign ministers resident in the country, or through the British ministers abroad. It is his duty to inquire into the complaints of British subjects residing in foreign countries, to afford them protection, and to demand redress for their grievances. The Foreign Secretary recommends to the Sovereign all ambassadors, ministers, and consuls to represent this country abroad. He grants Passports (q. v.) to British subjects and naturalized foreigners.

The Secretary for the Colonial Department has the supervision of the laws and customs of the colonies, watches over their interests, directs their government, apportions the troops necessary for their defence or police, appoints the governors of the colonies, and sanctions or disallows the measures of the colonial governments, rarely, however, prescribing measures for their adoption.

Each of these four secretaries of state is assisted by two under secretaries of state nominated by himself—one usually permanent, while the other is dependent on the administration in power.

The Secretary of State for India, whose office dates from the abolition, in 1858, of the double government of India by the Court of East India Directors and Board of Control, has the same control over the government of India which was formerly exercised by these bodies, and countersigns all warrants and orders under the sign-manual relating to India. He is assisted by an under-secretary, who is also a member of the legislature, and loses office with the cabinet, and by a permanent under-secretary and assistant-secretary, as also by a council of fifteen members, over whom he presides. Every order sent to India must be signed by the secretary, and all dispatches from governments and presidencies in India must be addressed to the secretary.

There is also a Chief Secretary for Ireland, resident in Dublin, except during the sitting of parliament, and under the authority of the Lord-lieutenant. His office resembles that of a secretary of state, but he is generally called Secretary to the Lord-lieutenant. He is assisted by an under-secretary.

The Secretary of State for War (see SECRETARY-AT-WAR) has the superintendence of all matters connected with the army, assisted by the commander-in-chief, and is responsible for the amount of the military establishment. He prepares for the royal signature and countersigns commissions in the army, and recommends to the sovereign for the order of Knighthood of the Bath.

SECRE'TION is the term employed in Physiology to designate the process of *separation* of those matters from the nutritious fluids of the body which are destined not to be directly applied to the nutrition and renovation of its organized fabric, but (1.) to be either at once removed as injurious to its welfare, or (2.) to be employed for some ulterior purpose in the chemical or physical processes of the economy itself, or to exert some kind of action upon other beings. For this definition of secretion considered as a process we are indebted to Dr. Carpenter; but the reader must bear in mind that the term is also very commonly used in another sense—namely, to designate the *products* which are thus secreted. In this latter sense, it is customary to speak of the biliary, urinary, or cutaneous secretion, when the bile, urine, and sweat are indicated.

Although it is impossible to divide with strictness the secreted products (as many physiologists have attempted to do) into the *excrementitious* and the *recrementitious*—that is to say, into (1.) those which have no further function to discharge in the animal body, and which, if not excreted, would act as poisons, and (2.) those which are subservient to further uses in the system—yet we may group them according to the preponderance of their excrementitious or recrementitious character. Dr. Carpenter approves of this mode of arrangement, and proposes that those secretory processes should be arranged in the first division in which the depuration of the blood is obviously the chief end, while those should be classed under the second in which the ulterior purpose of the separated fluid would seem to be the principal occasion of its production; and he further suggests a subdivision of this second group, according as this ulterior purpose is connected with the operations of the economy itself, as in the case of the tears, the saliva, the gastric juice, &c., or is destined to act on some other organism, as is the case with the secretion of the testes, the milk, &c.

The organs which yield the various secretions are termed Glands (q. v.); but neither the form nor the internal arrangement of the parts of a gland have any essential connection with the nature of its product; the true process of secretion, under whatever form it may present itself, being always performed by the intervention of Cells (q. v.). For a notice of the mode in which the cells are arranged in various glandular structures, the reader is referred to the articles GLAND, LIVER, KIDNEY, MUCOUS MEMBRANE, &c.

We shall now briefly notice the causes which render the due performance of the functions of secretion essential to the well-being of every animal. 1. Nearly all the solids and fluids of the body are liable to continuous decomposition and decay in consequence of their peculiar chemical composition. There is an obvious necessity that the products of incipient decomposition should be carried off and replaced by newly-organized matter. 2. The exercise of the various animal functions is essentially destructive to the structures by which they are accomplished: every operation of the muscular or nervous system appearing to require, as a necessary condition, a disintegration or breaking up of a certain portion of their tissues, probably by an act of oxidation. Hence, for the due preservation of health, the disintegrated or effete matters must be removed, and their place supplied. 3. When more food is taken than the wants of the system require, all that is not appropriated to the reparation of the waste, or to the increase in the weight of the body, must be thrown off by the excretory organs without ever having become converted into organic tissue. If this excess were not speedily removed by the excretory organs, the current of the blood would speedily become poisoned.

The following may be regarded as a tolerably complete list of the substances which are produced within the organisms of man and the lower animals by the disintegration of its various tissues, and which are met with in one or other of the products of secretion: 1. Products of secreting processes, including *a*, the biliary acids and the products of their disintegration; *b*, the pigments of the bile; *c*, pigments allied to those of the bile and blood, viz., hæmatoidin and melanin; *d*, cholesterin and its allies; *e*, the sugars and allied bodies. 2. Products of the actual regressive metamorphosis of tissues—*a*, nitrogenous amide-like bodies, such as leucine, tyrosine, creatine, creatinine, allantoin, cystin, guanine, sarcine, xanthin, and urea; *b*, nitrogenous acids, as hippuric, uric, and cynuric acids; *c*, indifferent nitrogenous bodies, such as the pigments occurring in the urine; and excretine; and *d*, non-nitrogenous acids, as acetic, benzoic, butyric, carbonic, formic, lactic, oxalic, succinic, and valerianic acids. Some of these products, however, only occur in the secretions in cases of disease.

SECRETIONS, VEGETABLE. In the vegetable kingdom, the term *secretion* has a wider application than in the animal kingdom, and all substances which have been formed by the action of cells upon the compounds taken up as food (such as carbonic acid, water, and ammonia)—whether these substances form a part of the tissue of the plant, or are thrown out upon its surface—are equally considered as secretions. All the important vegetable secretions are compounds of carbon, hydrogen, oxygen, and nitrogen; sulphur being also present in some cases; and according to their functions they may be classed in two great divisions—viz., (1.) nutritive or assimilable secretions, and (2.) non-assimilable or special secretions.

1. The *nutritive* secretions are those substances which, having been formed within the plant, are used in forming its structures and constructing its general mass. The chief substances in this class are cellulose, the varieties of starch, the varieties of sugar, the oils, and the so-called protein or albuminous bodies. The composition of these substances is extremely varied; thus, many of the volatile oils or essences contain only carbon and hydrogen; the sugars, starches and cellulose, contain carbon, hydrogen, and oxygen, and are named ternary compounds; while the protein bodies contain carbon, hydrogen, oxygen, and nitrogen, and, in some cases, sulphur.

2. The *non-assimilable* secretions are only found in certain parts of the plant, and they receive their name from their never being converted into the nutritive secretions. The principal members of this class are the coloring matter of plants (chlorophyle and its modifications); the substances which, when extracted from plants are of service as dye-stuffs (the *chromogens* or color-formers of recent chemists); the organic acids, which constitute a somewhat numerous group, and of which oxalic acid (occurring in rhubarb, sorrel, &c.), tartaric and racemic acids (in the grape), malic acid (in the apple and gooseberry), citric acid (in the orange, lemon, lime, and red currant), gallic acid (in the seeds of the mango), meconic acid (in the opium poppy), and tannic acid (in the bark of the oak, elm, &c.), may be taken as well-known examples; the vegetable alkalies or alkaloids, such as morphia, strychnia, quinia, &c.; the volatile oils; and the resins.

SECRET WRITING, or SYMPATHETIC INK. See INK.

SECRO'LE, a small town of British India, in the N.-W. Provinces, 3 m. N.-W. of Benares, contains most of the civil estab-

lishments, the military cantonments, and the residences of most of the British population connected with Benares. The residences or bungalows are handsome and substantial, but are scattered about among the groves and gardens which surround the military cantonments. The latter, which are capable of containing three or four regiments, are traversed by a small stream, the Burnah Nuddee. Among the public buildings are a Christian church and chapel, a court of justice, the treasury, the jail, and a mint. S., which may be considered as the British quarter of Benares, was the headquarters of the Benares division of the Bengal army, and here, on the 4th June 1857, the 37th Bengal Native Infantry, the 13th Irregular Cavalry, and a portion of the Loodianah Sikhs, in all 2000 men, mutinied; but being charged by Colonel (afterwards Brigadier-general) Neill at the head of 240 men of the Madras and Queen's armies, and a few faithful Sikhs and Irregulars, they were compelled to take to flight with the loss of about 200 men, after killing two of their own British officers and two privates of Neill's force.

SECTION, in Architecture, the delineation of buildings on a vertical plane through any part of them—as a *plan* is the horizontal projection. Sections are of great use in practice in showing the thickness of walls, the construction of floors, roofs, &c., and the forms and dimensions of every part of the interiors of buildings. Sections may also be used to show the furniture, drapery, &c., of rooms. These are called furnished sections. All mouldings, cornices, &c., are drawn in section or profile, full size, for the guidance of the workmen.

SECTOR, in *Geometry*, is a portion of a circle included between two radii and the intercepted arc of the circumference. The area of a sector is equal to that of a triangle whose base is equal in length to the intercepted arc, and whose perpendicular height is equal to the length of the radius.

SECTOR, in *Practical Mechanics*, an instrument of considerable utility in rough mathematical drawing, consists of two strips of wood, ivory, or metal jointed together like a carpenter's foot-rule.

Sector.

It is absolutely necessary for the correctness of the instrument that the center of the axle of the joint should be accurately at the inner corner of each slip (as shown in the figure), so that it will always be the vertex of a triangle of which the inner edges (and consequently any of the corresponding pairs of lines drawn from the joint obliquely along the rule) form the two sides. These oblique lines, which are drawn on both sides of the instrument, and converge from the extremities of the two strips to the center of the joint, are graduated in different ways, so as to give, on each limb, a line of equal parts, a scale of chords, scales of sines, tangents, and secants, a line of polygons, &c. (all of which are graduated from the center of the hinge, which is their zero point), besides a number of common scales on the blank portions of the sector. The special use of this instrument is in the finding of a fourth proportional to three given quantities, and the operation is performed as follows:

If the fourth proportional to 18, 16, and 81 is required, find the graduation indicating 18 on each limb; then obtain, by means of a pair of compasses, the length from 0 to 16, and open out the instrument till the two 18 points are as far apart as the distance given by the compasses; then, by measuring with the compasses the distance of the two graduations indicating 81, and applying the compasses to the scale, we obtain the fourth proportional required. It will be seen that this instrument merely supplies a mechanical mode of constructing two similar isosceles triangles, one of which has all its sides, and the other has only its equal sides given, the other side or base, which is formed by the sector, and read off by aid of the compasses and scale, being, from the very nature of similar triangles, the fourth proportion required. This instrument becomes more inaccurate as the angle formed by the limbs increases. The sector is said to have been invented by Guido Ubaldi about 1568, though Gaspar Mordente of Antwerp describes it in 1584, and attributes its invention to his brother Fabricius in 1554. It was described by several German and English writers in the same century, and again by Galileo, who claimed to have invented it in 1604.

SE'CULAR CLERGY. See CLERGY.

SE'CULARISM is the term applied to a system of ethical principles begun to be advocated about 1846 by G. J. Holyoake. As the system has a considerable number of adherents, and comes not seldom into public notice, a brief account of its leading doctrines is here given. As in similar cases, we allow a believer in the doctrines to speak for himself.

The Secular is defined as that which pertains to this life, and is treated as a thing apart; as independent of, rather than as necessarily opposed to, any other mode of thought and duty. Secularism, as regards opponents, claims that to ignore is not to deny. As the geometrician ignores chemistry or metaphysics, without a thought of denying them, so secularism, which concerns itself with this world, refuses to be held as conflicting with that 'other-worldiness,' which, if demonstrable, must be based on an experience to which secularism makes no pretension, and towards which it considers itself to incur no responsibility. Secularism commences by laying down the proposition that intelligent sincerity is sinless. It does not maintain that even intelligent sincerity is errorless, but that it is without conscious guilt, even when it is, as it may be, dangerously mistaken. The conscience thus educated, Thought may be intrusted to inquire, and the search for Truth may be begun.

Secularism takes the term Free Thought as expressing the central idea which it inculcates. It defines Free Thought as the unrestricted application of the powers of the intellect to any subject—the absence of any threat or penalty, legal, spiritual, or social, for the exercise of thought. The Free Thought it inculcates is not lawless thought; it is guided by methods of logic, limited by evidence checked at every step by experience, which is omnipresent, and corrected by the results of science. Free Thought is not the rebellion, but the judicial action of the understanding. Reason—the faculty of following the path of facts—does not despise intuition, nor instinct, nor the voice of nature, nor authority; it uses, but revises them; it does not pretend to be infallible, but to be the best arbiter we have. To the conception of Free Thought is also necessary the Free Publication of Opinion; for no one could profit by the thought of other minds unless it was freely communicated. Hence the diffusion of thought becomes an obligation on each thinker, and silence or supineness a social crime. Again, Free Thought that would command respect must be submitted to Free Criticism. Thought is often foolish, often mischievous, and sometimes wicked, and he alone who submits it to free criticism gives guarantees to society that he means well, since by criticism comes the exposure of false or foolish opinions; and the right of criticism is the sole protection of the public from error. Free Thought must end in the Free Action of opinion, since he thinks to no purpose whose thought is inapplicable to conduct; and he withholds the sign of his own sincerity who does not unite his thought with action. Such is that education in Free Thought which secularism attempts.

It holds that Scepticism is the pathway to affirmative truth. So far from being a crime, scepticism is scrutiny. So far from being the end, it is the beginning of inquiry—the first condition for the recognition of unknown truth. He who would be master of his own mind, and know what is in it, and who would have no principles there but those which are pure, true, and reliable, must refuse to believe anything until he is compelled to believe it; it being no more safe to keep one's mind open to all notions, than to keep one's door open to all comers. It is clear that the use of Free Thought may be a nuisance, a terror, or an outrage, unless Courtesy takes care of it. Therefore secularism provides that advocacy shall be directed to the exposure of error and the elucidation of truth, without moral imputation upon those whose opinions are controverted; and contends that all advocacy, wanting in consideration towards others, shall be regarded as a crime against Free Thought. The quality of the thought, and not the motive of it, is the proper and sufficient subject of discussion.

Secularism further imposes upon the action of Free Thought the limit that every one shall concede to others the liberty he claims for himself, and shall permit to others, and shall recognize in each individual, 'liberty of action in all things by which others are neither injured nor damaged. Secularism, regarding the one object of all Free Thought as the attainment of truth, finds in the study of nature its immediate sphere of exercise. Free Thought is prompted by a desire to fathom the knowable; and nature and human life are the immediate sources of truth and duty, which it most concerns man to master. Therefore respect for this life, respect for pure physical conditions, respect for the moral capacity of human nature, are conditions of secular belief.

Secularism is not committed to denying that there is other good—it does not meddle with that question; it says whether there be other good or not, the good of the present life is good, and it is good to seek that good. It holds that the secular is sacred, and seeks 'to find that material condition in which it shall be impossible for man to be depraved or poor.' It does not say that all things are material, or that there are no spiritual agencies; it does not enter upon these propositions; but confines itself to showing that there are material agencies in this life, whatever else there may be, and that these, as far as they can be discovered, are the calculable forces of the world, which cannot be neglected without folly or hurt, and that it is wisdom, mercy, and duty to attend to them. Without entering upon the question of the interference of Providence, secularism contends that Science is practi-

cally the Providence of life; that conscience is higher than consequence; that deliverance from calamity is more merciful than any system of consolation which only acts when calamity has occurred; and that it is not the pursuit of happiness, but the performance of duty, which is the end of life. Secularism proceeds in the path of Positive Philosophy, not seeking for errors but for truth; not busying itself with negations, but with affirmations. In sacred writ it seeks for guiding truth and thought which commends itself to reason and experience, accepting the intrinsically true, without entering upon the vexed questions of inspiration or authenticity. Whatever principles secularism inculcates, they are affirmative in their nature, relate to the welfare of humanity, and are determined by considerations purely human.

There is unquestionably a vast outlying class in every European country, and especially in our Indian territories, who are without the pale of Christianity. They reject it, they dislike it, or they do not understand it. Secularism is intended for these, and for all who find theology indefinite, or inadequate, or deem it unreliable. The object of secularism is to afford these classes a knowledge of principles addressed to their common reason and intelligence, by an appeal to principles of a secular nature, common to humanity in every state and clime. It may be a misfortune that the principles of theism, or the acceptance of the Bible, cannot be rendered promptly acceptable to them. Since, however, this is not the case, it must be of advantage to interest them in rules calculated for the moral guidance of their conduct. Upon these Christianity may be, if shown to be tenable, subsequently superinduced. The principles of secularism are intended to constitute an education of the working-classes, which begins with their reason, grows with their intelligence, and ends only with death.

Secularism is not an argument against Christianity, it is one independent of it. It does not question the pretensions of Christianity; it advances others. Secularism does not say there is no light or guidance elsewhere, but maintains that there is light and guidance in secular truth, whose conditions and sanctions exist independently, act independently, and act for ever. Secular knowledge is manifestly that kind of knowledge which is founded in this life, which relates to the conduct of this life, conduces to the welfare of this life, and is capable of being tested by the experience of this life.

Geometry, Algebra, Botany, Chemistry, Navigation, Political Economy, Ethics, are secular subjects of instruction (distinct albeit from secularism which includes the education of the conscience). They are founded in nature, they relate to the uses of this life, promote the enjoyment of this life, and can be tested by personal experience. That which is secular can be tested in time; that which is theological is only provable after death. If a sum in arithmetic is wrong, it can be proved by a new way of working it; if a medical recipe is wrong, the effect is discoverable on the health; if a political law is wrong, it is sooner or later apparent in the disaster it brings with it; if a theorem in navigation is erroneous, delay or shipwreck warns the mariner of the mistake; if an insane moralist teaches that adherence to the truth is wrong, men can try the effects of lying, when the disgrace and distrust which ensue soon convince them of the fallacy; but if a theological belief is wrong, we must die to find it out.

The standard of secularism is utilitarian. Utility is made the test of right, not the utility which is sensual and selfish, but that which takes into account the highest attributes and noblest aspirations of humanity (see UTILITARIANISM). It is not the agent's own happiness, but the happiness of others which the utilitarian is bound to promote. The adoption of this rule makes intelligence a necessity. Secularism is not sceptical. It seeks everywhere positive truth, and regards doubt as a difficulty and a danger. It is not infidel, for that is a state of mind treacherous to the truth, and truth is the first thing to which secularism teaches allegiance. It is not atheistic, atheism being alien to secularism, which concerns itself with the affirmative. Secularism might call itself religious, if it were allowable to use the term without including some distinctive theory of theism, which is equally excluded from the subject-matter of secularism, as not coming within the region of positive knowledge. Nothing in secular morals can be insisted upon with effect, save those statements which appeal to the common experience, and with which you can dare the judgment of mankind; but if that may be called religious, which appeals to demonstrative intelligence, which addresses itself to the conscience, which inculcates love, and truth, and justice; which claims service and endurance from all men; which places happiness in duty, and makes the service of humanity the one object of life, and the source of consolation in death, then secularism may be so defined, and in this sense it has been described in the following definitions:

Secularism is the religion of the present life: it teaches men to seek morality in nature, and happiness in duty; guiding the conduct, and educating the conscience of those who do not know, or who, from conscientious conviction, stand apart from Christianity. Secularism teaches a man to acquit himself well in this world as the purest act of worship, to study the truth, to judge by reason, to regulate human interests by considerations purely human, and to act on that rule of utility which conduces to the greatest good of others; thus endeavoring to deserve another life by the unhasting, unresting pursuit of duty in this.

SECUNDERÁBA'D (more correctly Sikandarábád), a large town, and an important British military cantonment in the Nizam's Dominions, India, six miles north of Haidarábád. On the north-east are two singular granite hills, large, hemispherical in shape, completely isolated, and having on their summits the tombs of Fakirs, which are visited by a great number of pilgrims each year. The cantonment consists of a curved, irregular street, three miles in length, with the officers' houses ranged on either side. There are numerous barracks, and good hospital accommodation. There are numerous tanks in the vicinity, and the water is good. The mean annual temperature is 81° 30′, and the climate is unhealthy—though less so now than formerly—during the rainy season. Pop of S., 40,000.

SECURITY, in Law, means some deed affecting real or personal estate, the object of which is to secure the payment of a primary debt. Such are Bonds (q. v.) and Mortgages (q. v.).

SEDAN, a manufacturing town and frontier fortress of France, in the dep. of Ardennes; pop. in 1876, 15,862. In 1646, Colbert founded here the first of his famous cloth factories; and the fabrics of S. have now a European reputation, and employ many hands. There is also extensive industry in various branches of metallurgy; and there are coal and iron mines in the vicinity. The fortress of S. has played a considerable part in military history; and it has recently become noted as the place where (September 2, 1870) Napoleon III. and an army of 90,000 men surrendered to the Prussians.

SEDA'N CHAIR, a portable covered vehicle for carrying a single person, borne on two poles by two men. The name is derived from the town of Sedan, in the north of France, where this species of conveyance is said to have been invented. It is said that the Duke of Buckingham was in the practice of using one in the reign of James I., a proceeding which gave general offence, it being made matter of public remark, that this royal favorite used his fellow-countrymen to do the work of beasts. The general introduction of sedan chairs into England dates from 1634, about the same period that hackney coaches came into use. Sedan chairs were largely used during the greater part of last century, being found very well adapted for transporting persons, in full dress, to public and private entertainments. Not only were there numerous public conveyances of this kind in London and all considerable towns, but the owner of every large mansion had his private sedan handsomely fitted up. In Edinburgh, a century ago, sedan chairs were far more numerous than hackney coaches, and were almost all in the hands of Highlanders. Sedans are now seldom seen except for the transport of the sick.

SE'DATIVES are medicines which exert a direct or primary depressing action upon the vital powers, without inducing any subsequent excitement. The diseases in which sedatives are employed are chiefly those of over excitement of the nervous and circulating systems; and as some of the members of this class (hemlock, for example) act directly on the nervous system, while others (foxglove, for example) more immediately act upon the heart, it is necessary to be able to determine the kind of sedative suitable for each individual case. Inflammatory fever presents all the conditions in which sedatives are likely to be of service. 'The excited heart, elevated temperature, hard and unyielding pulse, and the disordered state of the special nerves, call for the administration of remedies fitted to appease their excited energy, and the great improvement which, in such a case, follows the use of *blood-letting*, *tartar emetic*, and *digitalis*, bears evidence to the correctness of our practice.' (Ballard and Garrod's *Elements of Materia Medica*, p. 11.) The following are the most important members of this class, aconite, carbonic acid (applied locally in cases of irritable bladder or womb, or to painful ulcers), chloroform (especially when inhaled), conium, digitalis, hydrocyanic acid, and tobacco.

SEDGE. See CAREX.

SEDGWICK, an American family, distinguished in politics, law, and literature.—THEODORE S., statesman and jurist, was born at Hartford, Connecticut, May 1746. He was descended from Robert Sedgwick, a major-general of the army of Cromwell. Educated at Yale College, he adopted the profession of law, and removed to the western part of Massachusetts, where he was a member of the Colonial Assembly. Though a loyalist in feeling at the outbreak of the American revolution, he took the part of his country, and served as an aide-de-camp to General Thomas in the unfortunate expedition to Canada. In 1785, he settled at Stockbridge, Massachusetts, where his descendants now reside, became a member of the Continental Congress, and took an active

part in suppressing Shay's rebellion. He remained in congress as representative or senator until 1799, and in 1802 was appointed judge of the Supreme Court of Massachusetts, and was a prominent member of the old Federalist party, and an early opponent of slavery. He died at Boston, January 24, 1813.—THEODORE S., American lawyer and writer, son of the preceding, was born at Sheffield, Massachusetts, December 1780. Like his father he was bred to the legal profession, and in 1801 settled at Albany, New York, where he remained in successful practice until 1821, when he retired to Stockbridge, advocating, as a popular speaker, the interests of a scientific agriculture, free trade, temperance, and anti-slavery, and wrote *Public and Private Economy, illustrated by observations made in Europe in* 1836—1837 (3 vols., 12mo, New York, 1838). He died of a stroke of paralysis, after making a public speech at Pittsfield, Massachusetts, November 7, 1839.

SUSAN RIDLEY S., wife of the preceding, descended from an old English Border family, and proud of her relationship to Bishop Ridley, was the daughter of William Livingston, governor of New Jersey. She is the author of *The Morals of Pleasure* (1829); *The Young Emigrants*, and *The Children's Week* (1830); *Allan Prescott*, a novel (1834); *Alida* (1844); and *Walter Thornby*, a novel, written in 1859, when she was more than 70 years old.—CATHERINE MARIA S., American authoress, daughter of Judge Theodore Sedgwick, and sister of the second Theodore S., was born at Stockbridge, near the close of the eighteenth century. In 1822, she published *A New England Tale*, which was followed, in 1824, by *Ridwood*, a novel, so popular that it was reprinted in England, and translated into several of the continental languages. This was followed by *Hope Leslie, or Early Times in America* (1827); *Clarence, a Tale of our Own Times* (1830); *Le Bossu* and *The Linwoods* (1835); and these by a series of popular stories illustrating morals and domestic economy, entitled *The Poor Rich Man and the Rich Poor Man, Live and Let Live, Means and Ends, Home*, &c.; and contributed a 'Life of Lucretia Maria Davidson,' to Sparks's *American Biographies*. In 1841, on her return from Europe, she published *Letters from Abroad to Kindred at Home*; in 1845, *Wilton Harvey and other Tales;* followed by *The Morals of Manners*, and *Married and Single*. She also edited, and was an active contributor to some of the leading American periodicals. Died July 31, 1867.—THEODORE S., an American lawyer, son of the second Theodore S., was born at Albany, January 27, 1811, was educated at Columbia College, and admitted to the bar in 1833; and excepting three years spent at Paris, as secretary of the American legation, continued in successful legal practice until 1850, when he again visited and made an extensive tour in Europe. He steadily declined to engage in politics, and refused all offices tendered him, until, in 1858, he accepted that of United States attorney for the southern district of New York. Among his writings are a standard *Treatise on the Measure of Damages;* a work on *The Interpretation and Application of Statutory and Constitutional Law;* the *Memoirs of William Livingston*, his grandfather; *The Life and Works of William Leggett*, and various occasional addresses. He died at Stockbridge, December 9, 1859.

SEDI'TION (Lat. *seditio*, from *se*, apart, and *ire*, to go), a general name given to such offences against the state as fall short of treason. In the law of England, it is not a strictly technical word. Writing, publishing, or uttering words tending to excite subjects to insurrection, though not urging them to rebellion or total subversion of the government, come under this denomination. There are various English statutes (as 39 Geo. III., c. 70; 57 Geo. III., c. 19; and 60 Geo. III. and 1 Geo. IV., c. 8) directed against particular acts of sedition, such as seditious libels, and seditious meetings or assemblies, which are punishable as misdemeanors. Act 36 Geo. III., directed against all seditious practices and attempts tending to high treason, is extended to Ireland by 11 Vict., and additional provisions are added to it. By this latter act, the compassing or devising, either to depose the Queen; to levy war against the Queen, for the purpose of changing her Majesty's measures, or constraining or overawing parliament; or to move any foreigner to invade the Queen's dominions, is made felony, punishable by transportation for life, or for a period not less than seven years, and that even though the facts should amount to treason.

In Scotland, sedition is distinguished from Leasing-making (q. v.), in so far as the object of the latter is to disparage the private character of the sovereign, while the former crime is directed against the order and tranquillity of the state. The punishment of sedition, formerly arbitrary, is now restricted to fine and imprisonment.

SEDU'CTION, in point of law, is the taking of an unmarried woman's chastity without marriage, and under circumstances of fraud. It is not a criminal offence unless violence is used, and resistance overcome, or the age of the female is under 21, in which cases the offence is Rape (q. v.) or Abduction (q. v.). In England, where no force has been used, no action at law can be maintained by the female seduced, however deceitful the man may have acted. But if the female is a servant, either to her father or mother or a third party, then the master or mistress can sue the seducer, provided any loss of service has been caused by the seduction, such as her absence when lying-in of a child. Though, strictly speaking, the damages recovered by the master or mistress, in such a case, should be measured solely by the pecuniary value of the services lost, yet it is an inveterate practice for juries to give damages greatly beyond that amount, especially where the father or mother sues, and the conduct of the man has been base and heartless. In Scotland, the woman can sue in her own right for damages if deceit has been used, but the difficulty of establishing that the deceit was the sole cause of the injury, prevents such actions from being common. The remedy there more frequently resolves itself into an action for breach of promise of marriage, or for declarator of marriage, or for filiation and aliment.

SE'DUM, a genus of plants of the natural order *Crassulaceæ*, having the calyx in 4—8 (usually 5) deep segments, which often resemble the leaves, the same number of spreading petals, twice as many stamens, and 4—8 (usually 5) germens, each with a nectariferous scale at the base. The species are numerous, with succulent, often roundish, leaves; and pretty, star-like flowers. Many of them grow on rocks, whence the English name STONECROP. They are natives of the temperate and cold parts of the northern hemisphere; some are British. They have no important uses; some are refrigerant, others are acrid. Among the British species is *S. Telephium*, popularly called ORPINE, sometimes used as a diuretic; and *S. acre*, the most common, whose brilliant yellow flowers adorn the tops of old walls, the débris around quarries, &c.

SEE (Lat. *sedes*, a seat), in ecclesiastical use, properly signifies the seat or chair (*cathedra*), sometimes also called 'throne,' of a bishop. Popularly, however, and indeed by universal usage, it is employed to designate the city, and thence, at least in popular language, the entire diocese, in which the seat of the bishop is placed, and over which, consequently, his episcopal jurisdiction extends. Sees have always been fixed, at least in their primitive establishments, in some city or considerable town; and it is to be observed that the name of a see is always taken not from the district governed by the bishop, but from the city or town. Sees *In Partibus Infidelium* (q. v.) still retain their ancient names, although in very many cases not merely the cities themselves, but even all traces of the Christian religion, in the sites upon which they anciently stood, have disappeared. In the Roman Church, the pope alone establishes sees, and alters their distribution and their local limits and boundaries; but these changes are not made except in extreme cases (such as that of the French Revolution) without the consent of the actual bishop. In the Anglican Church, this is done by the authority of the legislature.

SEED, in Phanerogamous Plants, that part which may in some measure be regarded as corresponding to the perfectly developed impregnated *ovum* of animals, and which is the utmost effort made by the plant for the reproduction of its species. It is the perfectly developed Ovule (q. v.). Whilst one cell of the interior of the nucleus (see OVULE) greatly enlarges, the other cells are forced back; the interior of the nucleus thus becomes a cavity (the embryo sac), and Fecundation (q. v.) now taking place by means of the pollen, the primary cell is formed, which grows to form the *embryo*. As the fertilized ovule is developed into the ripe seed, the *foramen* (see OVULE) or *micropyle* closes completely; but its place is commonly marked in ripe seeds by a little cicatrix. In the ripe seed, the integuments of the ovule, more fully developed, form the covering (*spermoderm*); whilst the *nucleus* is either entirely converted into the Embryo (q. v.), or also into an unorganic cellular mass called the Albumen (q.v.), which is, in an economical point of view, the most important part of many seeds, as of those of the cereal grasses. The embryo, which with respect to the reproduction of the plant, is the most essential part of the seed, is developed to various degree in different plants—which is also the case in different animals, and even in those of the same class, as in mammalia; but in general, the *radicle* may be distinguished in it—the beginning of the root or descending axis of the new plant, and the *plumule* or *gemmule*—the beginning of the stem or ascending axis, as well as the *cotyledon* or cotyledons, provided for the nourishment of the new plant in its youngest stage. When the embryo is accompanied with albumen, it is sometimes completely enclosed in it; sometimes it lies at the side of the albumen; and sometimes it surrounds the albumen like a ring, or even completely.

Sometimes, but rarely, the embryo is not well developed in ripe seeds, so that its parts cannot be distinguished, as in the *Orchideæ*, in which it appears as a roundish or oval, uniform, little cellular mass. In germination, the embryo breaks through the covering of the seed, and develops itself into the new plant.

Seeds are either *sessile* or *stalked*. The stalk is of various length, and is formed of the *funiculus* or *umbilical cord;* the place at the

base of the seed, by which it is affixed to the inside of the fruit, or to the end of the *funiculus*, being called the *Umbilicus* or *Hilum*. When the seed is perfectly ripe, it has no further need of connection with the parent plant, and the *funiculus* dries up, leaving the *hilum* a mere scar.

Besides being enclosed in a capsule, or in a succulent fruit, &c., the most essential parts of the seed have coverings of their own, which are reckoned as belonging to the seed itself. Its general covering is called the *spermoderm* (Gr. *sperma*, seed, *derma*, covering), which consists of an external membrane, the *testa* (Gr. shell) or *episperm* (Gr. *epi*, upon) and an internal membrane, the *endopleura* (Gr. *endon*, within, *pleura*, side). Sometimes there is within the episperm a fleshy layer, called the *sarcosperm* (Gr. *sarx*, flesh). The Aril (q. v.) is a comparatively rare additional covering.

The seeds of phanerogamous plants afford characters which distinguish two great classes as *Monocotyledonous* and *Dicotyledonous* (see COTYLEDON). Very few plants have more than two cotyledons (seed-lobes). It is the case, however, with some of the *Coniferæ*. Cryptogamous plants are also designated *Acotyledonous*, as having no seed-lobes; and the name *Spore* (q. v.) is distinctively given to their seeds.

Seeds retain their vitality very long; but the time seems to be very various with the seeds of different plants, and in different circumstances. The grains, or seeds of cereal grasses, are probably excelled in this respect by none; grains of maize found in the tombs of the Incas have been made to vegetate; and also, it is said, grains of wheat taken from Egyptian mummies, although of this there is some doubt. After the great fire of London in 1666, plants not previously common sprang up abundantly on the waste ground; certain plants previously unknown there are sure to appear after a fire in the American forests; and instances are constantly occurring of a deep trenching of land or a turning up of soil by railway or other operations, producing a crop of some kind of plant previously unknown or rare in the locality. Thus the writer of this article has seen plants of the Milk Thistle appear on rubbish thrown out from the foundation of a house in Peeblesshire, where there was no other Milk Thistle in the neighborhood. And in Paisley Moss, in Renfrewshire, willows spring up in the ditches which are cut for drainage, from the surface of the soil which underlies the moss or peat. It is difficult to conjecture how long the seeds, in such cases, may have retained their vitality.

Exposed to the air, however, seeds generally lose their vitality in a few years. Some kinds retain it much longer than others. Seeds which abound in fixed oil seem to lose it more quickly than others.

In conveying seeds from one part of the world to another, and through great diversities of climate, it is desirable to have them as closely secured from the air as possible. But it has been found that of seeds brought from the Botanic Garden at Calcutta to Scotland, round the Cape of Good Hope, with no other care than would be used in sending a parcel from a seed-shop to a neighboring garden, the greater part readily vegetated.

SEE'LAND (Dan. *Själland*), the largest and most important island of Denmark, lies between the Cattegat and the Baltic, and is separated by the Sound from Sweden, and by the Great Belt from Fünen. Length, 78 miles; extreme breath, 70 miles; area, 2672 sq. m.; pop. in 1870 (including the two small islands Möen and Samsoe), 637,711. The surface is almost flat; the coasts, which are rock-bound on the south-east, are indented by bays and fiords, the chief of which is the Roeskilde-Isefiord in the north. The rivers are small, the largest being only 50 miles long; there are several lakes, and all the waters abound in fish. The island contains several beech-forests, is exceedingly fruitful in corn, and breeds excellent horses and cattle. Agricultural and cattle-breeding are the principal employments of the inhabitants. The chief place is Copenhagen (q. v.), the capital of the country, on the east coast, and from this city, lines of railway traverse the island to Elsinore in the north, and to Korsör in the south-west, on the coast.

SEER. See PROPHECY.

SE'GGAR, a vessel used by potters to protect delicate articles from the too fierce action of the fire in the kiln. See POTTERY.

SE'GMENT (Lat. *segmentum*, a part cut off) is, in Geometry, a portion cut off from a circle by a line, or from a sphere by a plane. When the angle subtended at the center of a circle by the segment, and the radius, or when the chord of the segment and its height, are known, the length of the arc of the segment and its area can be determined with as much accuracy as the circumference and area of the whole circle. See SPHERE.

SE'GNO (Ital. sign), a word used in musical notation in connection with marks of repetition. When a part is to be repeated, not from the beginning, but from some other point, the mark :S: is placed over the point where the repetition is to commence, and the words *Dal Segno* (or *d. s.*) are written at the close of the part to be repeated.

SE'GO, an important town of Western Africa, capital of the state of Bambarra, stands on the Niger, here called the Joliba, in lat. 13° 5′ N., long. 7° W. Its streets, which are winding, have a breadth of from 24 to 26 feet, and are extremely clean. The palace of the king is large enough to accommodate 2000 men and 500 horses. The houses are built of clay and are flat-roofed, and the royal residence differs from the other dwellings only in size. The country in the vicinity is well cultivated, and the town is the seat of considerable traffic. Mungo Park, from whom we derive almost all the knowledge we possess of S., here first beheld the Joliba. Pop. estimated at 30,000.

SEGO'RBÉ, a small town of Spain, in the modern province of Castellon, on the right bank of the Palancia, in a valley renowned for the beauty of its scenery and for its amazing fertility, 20 miles north-west of Murviedro. It stands on a hill between two castles, and contains stately houses, numerous churches, and a cathedral. Brandy-distilling is carried on to a great extent, and there are flour and paper mills. Pop. 8200.

SEGO'VIA, an interesting city of Spain, capital of the modern province of the same name (see CASTILE), stands on the Eresma, by which it is nearly encircled, 47 miles north-north-west of Madrid. It occupies the top of a rocky knoll, 3300 feet above sea-level, is surrounded by picturesque walls with round towers, and consists of narrow uneven streets, with old, quaint, and stately houses, 24 parish churches, and 21 convents. The Alcazar or castle, is perched on the west extremity of the rocky height, and was originally Moorish, but repaired magnificently in 1452—1458. The cathedral of S., a noble specimen of florid Gothic, is one of the finest in Spain. The present building was begun in 1525. The square cupola-crowned tower is 330 feet high, and the prospect from this elevation is superb. The grand aquaduct of S., supposed to have been built in the time of Trajan, is believed to be the most important Roman structure in Spain. It consists of two rows of arches, the one resting upon the other, from 2500 to 3000 feet long, and 102 feet high. There is a mint here for coining copper money. Wool-scouring and the manufacture of woollen fabrics are languidly carried on. Pop. 12,100.

S. was a place of importance during the time of the Romans; was the seat of immense cloth-manufactures in the time of the Moors, and was frequently the residence of the kings of Castile and Leon. Charles I. of England lodged at the Alcazar, September 13, 1623, and supped on 'certaine trouts of extraordinary greatnesse.' The unresisting town was sacked in 1808 by the French under Frere.

The province of S, has an area of 3460 square miles, and a population (1870) of 150,812.

SEGUR, the name of a French family, distinguished both in arms and letters. It is of Limousin origin, and was known there, it is said, as far back as the 9th century. The first, however, that specially merits notice was HENRI FRANÇOIS, Comte de S. (born 1689, died 1751), an able French general in the war of the Austrian Succession. His son, PHILIPPE HENRI, Marquis de S. (born 1724, died 1801), fought in the Seven Years' War, obtained the dignity of *Maréchal de France* in 1783, and outlived in his retirement the stormy scenes of the Revolution. The eldest son of this Philippe Henri was LOUIS PHILIPPE, Comte de S. (born 1753, died 1830), a vivid dashing sort of man, for some years ambassador at the court of St. Petersburg, and a great favorite with Catharine II. Of impressionable fancy, full of enthusiasm for the 'philosophers,' the 'reign of reason,' and the 'new ideas' generally, he hailed the great Revolution with delight, but took no prominent part in it. His public career during the Empire was respectable, but not brilliant; but one notices with satisfaction that he retained in extreme old age that love of liberty that marked his early years; the last act of his life being an eulogium on the revolution of July. As a writer, S. has in wonderful perfection the national graces of style and spirit. Among his numerous writings are: *Pensées Politiques* (Par. 1795), *Histoire de Frédéric Guillaume II.* (Par. 1800, *Contes, Fables, Chansons et Vers* (Par. 1801), and *Mémoires ou Souvenirs et Anecdotes* (Par. 1824). He left two sons, OCTAVE and PAUL PHILIPPE, the latter of whom (who was born in 1780) was a general of the First Empire, took part in the fatal expedition to Russia in 1812, and wrote the story of the campaign, *Histoire de Napoléon et de la Grande Armée pendant l'anée* 1812 (Par. 2 vols., 1824). The work has had an immense success, and has been translated into almost all the languages of Europe. Other works of the Comte Paul Philippe de S., are: *Lettre sur la Campagne du Général Macdonald dans les Grisons* (Par. 1802), *Histoire de Russie et de Pierre le Grand* (Par. 1829), *Histoire de Charles VIII., Roi de France* (Par. 1834); &c.

SEGU'RA, a river in the south-east of Spain, rises in the Sierra Seca, and after an east-south-east course of about 180 miles, enters

the Mediterranean 27 miles below Orihuela. Ships unload at its mouth.

SEI'DLITZ POWDERS are composed of 120 grains of tartrate of soda and potash, and 40 grains of bicarbonate of soda reduced to powder, mixed and enclosed in a blue paper, and 35 grains of powdered tartaric acid in a white paper. The contents of the blue paper are dissolved in from half a tumbler to a tumbler of water, and those of the white paper are then stirred in. The mixture should be taken while the effervescence from the liberation of the carbonic acid is still going on. These powders act as an agreeable and mild cooling aperient. If a stronger dose is required, either an increased quantity of the powder may be used, or a little sulphate of magnesia (about a drachm) may be added.

SEI'GNIOR, GRAND, a name sometimes given to the Sultan (q. v.) of Turkey.

SEINE, the metropolitan dep. of France, completely enclosed by the dep. of Seine-et-Oise, is a portion of the former province of L'Ile-de-France, and derives its name from that of its principal river (see SEINE, river). It is at once the smallest and the most populous dep. in the empire; its area is 183 sq. m.; its pop. in 1876 was 2,410,849; and in 1881, 2,799,329. From south-east to north-west, the dep. is traversed a distance of 37 miles by the winding Seine, which receives the navigable Marne at Charenton, and the Bièvre at Paris. The surface is marked by undulations and low hills, the highest of which, Mont-Valérien, is only 446 feet above sea-level. The climate is pleasant and healthy. The scenery—of which the woods of Verrières, Meudon, and Saint-Cloud, together with those of Vincennes and Boulogne, transformed into parks, and watered by artificial rivers and lakes, are perhaps the most striking features—is remarkably pleasing.

A network of canals and railways, the latter converging in the capital, afford easy means of transit in any direction. The soil is calcareous, and in the greater part, naturally infertile, but owing to the skill of the farmers and gardeners, who obtain abundant supplies of manure from the metropolis, the country around Paris (q. v.) and its suburbs has been rendered remarkably productive. The culture of vegetables and fruits for the markets of Paris is one of the most important branches of husbandry. Enormous quantities of mushrooms are cultivated in the ancient quarries of Paris near Montrouge. Quarries abound, and are productive.

SEINE (anc. *Sequana*), one of the most important rivers of France, rises near Mont Tasselot, in the middle of the dep. of Côte-d'Or, and after leaving the northern boundary of that dep. flows west-north-west through the deps. of Aube, Seine-et-Marne, Seine, Seine-et-Oise, Eure, and Seine-Inférieure, to the English Channel, which it reaches at Havre, after a course of 470 miles. It passes the towns of Troyes Méry—where 350 miles from its mouth, it becomes navigable—Corbeil, Paris, Elbeuf, Rouen, and Havre. The source of the river is about 1420 feet above the level of the sea; but below Paris its current is slow, and its course to Rouen is marked by numerous windings. Its lower course also is banked by steep hills, which, while they are picturesque, are everywhere cultivated. The principal affluents are, from the right, the Aube, Marne, and Oise; from the left, the Yonne, Loing, Essone, and Eure.

SEINE-ET-MARNE, an inland dep. in the north of France, is bounded on the E. by the dep. of Seine-et-Oise, and forms a portion of that wide basin in the middle of which stands Paris. Area, 2214 sq. m.; pop. (1881) 348,991. The dep. owes its name to the two chief streams that water it, and of which the Seine flows through the southern, and the Marne through the northern part. There are no mountains, but ridges of low hills separate the fertile and extensive though not deep valleys. Timber is grown in every part; and among the forests is that of Fontainebleau. The soil is generally fertile. Of cereals, wheat is the principal crop. Vegetables and fruits are also largely grown, and the meadows and pastures, natural and artificial, are extensive and productive. The wines are mediocre in quality, but the grapes for the table, called the *Chasselas de Fontainebleau*, have a European reputation. The capital is Melun, and the arrondissements are Melun, Coulommiers, Fontainebleau, Meaux, and Provins.

SEINE-ET-OISE, a dep. in the north of France, encloses the metropolitan dep. of Seine (q. v.). Area, 2163 sq. m.; pop. (1881) 577,798. The great rivers are the Seine and Oise, which have numerous affluents. Extensive plains occupy the southern districts; but in the north, the country is much broken, and picturesque valleys and great forests occur. The soil is not in general very fertile; but owing to the vicinity of the capital the amount of produce is great. Among the minerals, are several fine varieties of stone and fine clays. In addition to the usual branches of manufacture, porcelain is largely made at the famous Sèvres (q. v.) factories. The dep. is divided into the arrondissements of Versailles, Corbeil, Etampes, Mantes, Pontoise, and Rambouillet, and the cap. is Versailles.

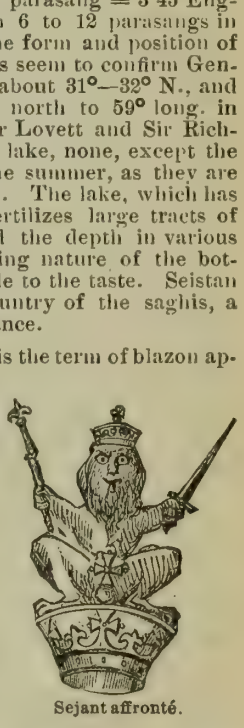
SEINE-INFÉRIEURE, a maritime dep. of France, bounded on the north-west by the English Channel, and on the south by the dep. of Eure. Area, 2328 sq. m.; pop. (1881) 814,068. The Seine flows through the southern districts; but a number of important though small streams flow north-west across the dep., and fall into the Channel. The range of the hills of Caux extends from east to west, and to the south of it are rich pasture-lands, watered by the Seine and its affluents. Husbandry flourishes chiefly in the middle and in the east districts. The coasts are formed of chalk-cliffs, varying in height from 200 to 650 feet. The arrondissements are Dieppe, la Havre, Rouen, Neufchâtel, and Yvetot. The capital is Rouen, which communicates with Dieppe by a direct line of railway.

SEIR-FISH (*Cybium guttatum*), a fish of the family *Scomberidæ* having finlets, and the sides of the tail keeled, the teeth compressed and sharp. It inhabits the seas of the East Indies, and is one of their most valuable fishes. In size and form, it is very similar to the salmon, which its flesh resembles also in firmness and flavor, although of a white color.

SEI'SIN. See SASINE.

SEISTA'N or HAMOON LAKE (anc. *Aria Palus*), a large, irregularly-shaped, shallow lake of Afghanistan, bordered with plantations of tamarisk and other trees, and enclosed by the province of Seistan. It is 25 parasangs (a parasang = 3·45 English miles) in length, and it varies from 6 to 12 parasangs in breadth. It is difficult to fix accurately the form and position of the lake, but the most recent explorations seem to confirm General Ferrier, who says that it is in lat. about 31°—32° N., and that it lies obliquely from 60° long. in the north to 59° long. in the south. It was visited in 1872 by Major Lovett and Sir Richard Pollock. Of the rivers which feed the lake, none, except the Helmund, contribute any waters during the summer, as they are then diverted for the irrigation of the land. The lake, which has no outlet, overflows its boundaries, and fertilizes large tracts of country. It is only about 4 feet deep, and the depth in various parts is constantly altering from the shifting nature of the bottom. Its waters are black and disagreeable to the taste. Seistan is a corruption of Saghistan—i. e., the country of the saghis, a kind of wood which grows here in abundance.

SE'JANT, or ASSIS (Fr.) in Heraldry, is the term of blazon applied to a beast in his usual sitting posture. A lion borne in full face, with his forepaws extended sideways, is blazoned sejant affronté, as in the crest of Scotland.



Sejant affronté.

SEJA'NUS. See TIBERIUS.

SELACHIANS, the Sharks and Rays. See CARTILAGINOUS FISHES.

SE'LBY, a market-town and river-port in the West Riding of Yorkshire, on the right bank of the Ouse, 12 miles south of York by railway. The ancient Gothic cross which adorns the market-place, and the character of the architecture of the houses, attest the age of the town. The magnificent parish church 300 feet long by 60 feet wide, is part of an abbey founded by the Conqueror in 1068. The movable bridge across the river offers a passage to shipping, and the river is navigable to S. for vessels of 200 tons. Means of communication by railway and canal are abundant. There are iron and brass foundries, and slips for building river craft; and the manufactures include sail-cloth, ropes, &c. Pop. (1871) 6193; (1881) 6033.

SELDEN, JOHN, an illustrious English scholar and lawyer, was born December 16, 1584, near Worthing, in Sussex, studied at Hart Hall, Oxford, for three years, and then removed, first to Clifford's Inn, London, and afterwards to the Inner Temple, for the pursuit of law. It was here that his great learning began to attract attention, and won for him the friendship of Camden, Usher, Sir Robert Cotton, and Sir Henry Spelman. S. wrote his first treatise, which related to the civil government of Britain previous to the Norman Conquest, and was entitled *Analecton Anglo-Britannicon*, in 1606, when only twenty-two years of age, though it was not published till nine years later.

In 1610, appeared his *Jani Anglorum Facies Altera* (English translation 1683), giving an account of the common and statute law of English Brittany to the death of Henry II.; and in 1614 was published his *Titles of Honor*, a work still regarded as of high authority on the subject of which it treats. Three years later, appeared an erudite, but, judging from what Le Clerc says, not a very critical or well-digested, work on the Syrian gods, especially in their connection with the Old Testament, entitled *De Diis Syriis. Syntagmata Duo*. Next year, however, he excited great indigna-

tion among the clergy by his *Treatise of Tythes*, in which he endeavored to prove that tithes are not due by divine right under Christianity, but solely because the law has imposed them. S. was assailed with diatribes, animadversions, additional animadversions, historical vindications of the *jus divinum* of tithes, &c.; but it does not appear that the arguments were very convincing to Selden. In 1621, he suffered a brief imprisonment for advising the parliament to repudiate King James's doctrine that their privileges were originally royal grants; in 1623, he was elected member for Lancaster, and from this period till his death, he took a considerable part in public affairs, yet not such as to materially interfere with the continuance of scholarly pursuits. S.'s political position is somewhat difficult to define. There is no doubt that he was sincerely attached to the cause of the parliament, and as sincerely opposed to the views of the court-party and the king. But he was above all things a constitutional lawyer, and derived his ideas of the rights of the subject from the history of the nation, and not from religious fanaticism or metaphysical considerations.. Still, he 'loved his ease,' according to Clarendon (who has painted S.'s portrait in his usual fine style), and so let things be done without protest, of which he did not approve. Personally, he was rather a favorite with King Charles, on account of his learning and moderation.

In 1630, he was committed to the Tower, for his activity in opposing the policy of the court, and remained a prisoner for four years, when he was released through the favor of Archbishop Laud and the Lord Treasurer; in 1640, he was chosen member for the university of Oxford; and now, when the struggle between the king and the nation began to grow dead-earnest, he was occasionally suspected of not being zealous enough by such as were themselves perhaps over-zealous. He threw the weight of his learning and argument into the scale against the bishops (towards whom, like Milton and other lay-champions of freedom, he felt a peculiarly strong antipathy), when the question came up as to their tenure of seats in parliament; he was one of those who drew up the articles of impeachment against Laud; he sat as a lay-member in the Assembly of Divines at Westminster, 1643, and perplexed his clerical colleagues sadly. In 1644, he was elected one of the twelve commissioners of the Admiralty; in 1646, the sum of £5000 was voted to him by parliament, in consideration of his services and sufferings; in 1647, he was appointed one of the university 'visitors,' and always used his influence to moderate the tyranny of his fanatical colleagues. After the execution of Charles (of which it is certain he strongly disapproved, as both unlawful and inexpedient), he took little share in public matters; and when requested by Cromwell to answer the *Eikon Basilike*, he refused. His death occurred November 30, 1654, in the house of Elizabeth, dowager-countess of Kent, with whom he had long lived in such intimacy that people said they were married.

The principal writings of S., besides those already mentioned, are: *Marmora Arundelliana* (1629); *De Successionibus in Bona Defuncti secundum Leges Hebræorum* (1634); *De Successione in Pontificatum Hebræorum, Libri Duo* (Leyd. 1638); *De Jure Naturali et Gentium, juxta Disciplinam Hebræorum* (1640), a work more learned than critical (like most of S.'s biblical productions, who thought far too much of the opinions of the Rabbins); and *Uxor Hebraica; Mare Clausum* (1635), a reply to Grotius's *Mare Liberum* (treatises which originated in a dispute between the English and Dutch concerning the herring-fishery upon the British coast, to which the Dutch laid claim); *De Anno Civili et Calendario Judaico* (1646); *De Synedriis et Præfecturis Hebræorum* (1650 *et seq.*); besides a great variety of posthumous works, of which the most famous, and also the most valuable, is his *Table-talk* (recorded and published by his amanuensis, Richard Milward, in 1689), of which Coleridge says (with considerable exaggeration, however): 'There is more weighty bullion sense in this book than I can find in the same number of pages of any uninspired writer.' S. was highly esteemed by all his great contemporaries, both royalist and parliamentarian, on account of his integrity, candor, and vast erudition; but his moral courage or enthusiasm was not remarkable (except when tilting at the bishops—*then*, like Erasmus on the monks, he was quite heroic); and, on the whole, as compared with Milton, he occupies the level which Erasmus did in relation to Luther. S.'s works were collected and published at London in three folio volumes, 1726.

SEL D'OR, a salt employed in photography, originally to aid in fixing and improving the image on a Daguerreotype-plate, and more recently for toning positive paper-proofs. It is a double hyposulphite of gold and sodium, the constitution of which is expressed by the formula $AuO.S_2O_2 + 3NaO,S_2O_2 + 4HO$. It is formed when 1 part of chloride of gold in solution is added to 3 parts of hyposulphite of soda, also in solution. The hyposulphite of soda should be always in excess during the mixture, a condition which is secured by adding the chloride of gold to the hyposulphite of soda, and not *vice versa*. The salt so formed is precipitated in fine, white, crystalline needles on the addition of alcohol to the above mixed solutions; these are collected on bibulous paper, and gently dried for use. Adulterations in the commercial article, which are unfortunately only too common, may be ascertained by precipitating, igniting, and weighing the gold contained in the sample it is desired to test. Nitric acid free from chlorine will decompose this salt, and precipitate its contained gold in the metallic form.

SELE'NE, the Greek name of the goddess of the moon; called also *Mene*, and in Latin, *Luna*. Her myth is differently told, but the most common account makes her a daughter of Hyperion and Theia, and sister of Helios (the Sun) and Eos (the Dawn); as sister of Helios, also called *Phoibos* (the Shining One), she had the name of *Phœbe*, and latterly was identified with Artemis (see DIANA), though the identification was never quite exact, as Artemis always retained her reputation for chastity, while S. had 50 daughters by her lover Endymion, and several by Zeus, one of whom was called *Erse* ('the Dew'), indicating the original physical character of the myth. In Art, the two are always distinct. S. is represented by the poets with long wings and a golden diadem, riding across the heavens in a chariot drawn by two white horses, cows, or mules.

SE'LENITE (Gr. *Selene*, the moon), a transparent and beautiful variety of Gypsum (q. v.), white, or tinged with green, gray, or yellow. It receives its name from its peculiar moon-like lustre. It is often crystallized in six-sided prisms, sometimes in lenses, and twin crystals and quadruple crystals occur. It is found in common gypsum, in rock-salt, in the Blue Clay of the south of England, &c. There is in the British Museum a splendid group of crystals of S., presented by the late Prince Albert. S. is easily cut, and is capable of being split into extremely thin plates, which are flexible, although not elastic. It was used by the ancients for some of the purposes for which we use glass. The Romans imported it from Spain, Cyprus, Cappadocia, and Africa. The hothouses of Tiberius were covered with it, and Pliny mentions that it was used in the construction of beehives by those who wished to watch the operations of the bees. It is used for making the finest kind of stucco, and the most delicate pastil colors. When burned, and perfectly dry, its powder is used for cleansing and polishing articles of gold and silver, precious stones, and pearls.

SELE'NIUM (Se; old equiv. 39·5; new, 79; sp. gr. 4·28) is an element having two forms. In the *vitreous* form, at ordinary temperatures, it is a solid of a dark-brown color, and when broken, presents a conchoidal vitreous fracture; thin splinters of it are, however, of a dark-red tint when seen by transmitted light. It is tasteless and inodorous, a non-conductor of electricity. When S. is very slowly cooled from the fused condition, its appearance is quite different; the structure being *granular* or *crystalline* (sometimes called 'metallic'). Crystalline S. is of a dull leaden color; unlike the vitreous S., is very opaque to light even in thin films; and is a conductor of electricity at ordinary temperatures. Its resistance to the passage of an electric current diminishes up to the point of fusion, but suddenly increases as the S. becomes liquid. Another property of crystalline S., which has recently given it a new interest, is that it is remarkably sensitive to light; and its electrical resistance varies very much according to its exposure to light, being much less in the light than in the dark. It was in virtue of this property that the experiments were made which led, in 1880, to the discovery of the Photophone (q. v.).

S. remains a solid up to 392°, when it fuses into a fluid, which boils at 650°, emitting an inodorous vapor of a deep yellow tint. When heated in the air, S. does not very readily take fire; but it is combustible and burns with a blue flame, while a portion of it is volatilized in red fumes. The products of combustion are oxide of S. and selenious acid.

S. is of rare occurrence in nature; it is chiefly found as a selenide in combination with lead, silver, copper, or iron; but it has also been discovered in sulphur, and in certain sulphides of iron. It forms three compounds with oxygen—oxide of S., selenious acid, and selenic acid; while with hydrogen it forms seleniuretted hydrogen, or hydroselenic acid.

S. was discovered in 1817 by Berzelius, in the refuse of a sulphuric-acid manufactory. He named it S. (from Gr. *selene*, the moon), because in many respects it resembled tellurium (named from Lat. *tellus*, the earth).

SELEU'CIA, the name of seven ancient cities of Asia, situated in Syria, Pisidia, Pamphylia, Cilicia, Caria, and Mesopotamia, and founded during the earlier existence of the dynasty of the *Seleucidæ* (q. v.). The most distinguished of these were: 1. SELEUCIA PIERIA, founded by Seleucus Nicator, on the seashore, about 4 miles north of the mouth of the Orontes, and strongly fortified. It was the seaport of Antioch, and became of great importance during the wars between the Seleucidæ and the Ptolemies for the possession of Syria. It rapidly declined under the Roman dominion. The ruins have been fully explored and

described in modern times by Pococke (*Observations on Syria*) and Chesney (*Royal Geographical Society's Journal*, vol. viii.) Its once magnificent port is in such an extremely good state of preservation as to require few repairs to render it serviceable; and the remarkable tunnel of 1088 yards in length, which was excavated out of the solid rock, and formed the only communication between the city and the sea; and the remains of its triple line of walls, of its citadel, temples, amphitheater, necropolis, &c., all attest the former importance and splendor of the city.

2. SELEUCIA ON THE TIGRIS, was also built by Seleucus Nicator, on the west bank of the Tigris, 40 miles (according to Strabo 33) north-east of Babylon, which was despoiled to supply materials for the construction of the new city. Situated in a district of great fertility, commanding the great trading routes of Assyria, Babylonia, and Western Persia, it rapidly rose to great wealth, and splendor, supplanted Babylon as the capital of the eastern portion of the Seleucide monarchy, and when in the acme of its greatness, contained a population of more than 600,000. Even in Strabo's time, it was larger than Antioch in Syria, the greatest commercial emporium of Asia; and down to the period of its final destruction, the number of its inhabitants is said to have never fallen below half a million. During the decline of the Seleucide monarchy, it became independent, and formed, from its wealth and splendor, an irresistible bait to the robber-tribes of Southern Armenia and Media, who partially plundered it on more than one occasion. But its position on the confines of Persia, which gave it its greatness, was also the cause of its destruction; for when the Seleucide monarchy was swallowed up by the Romans, and the long and desolating struggle between the latter and Persia had commenced, S., placed between two fires, was speedily brought to ruin. It was burned by Trajan (116 A.D.), and a few years afterwards, by Lucius Verus; and when visited by Septimius Severus was as desolate as the mighty city it had supplanted. The Emperor Julian, on his expedition to the East, found the whole country round it converted into a vast marsh, the haunt of innumerable beasts of chase and wild-fowl, and the city itself completely deserted.

SELEU'CIDÆ, the dynasty of kings to whom fell that portion of Alexander the Great's immense and ill-compacted monarchy which included Syria, a large portion of Asia Minor, and the whole of the eastern provinces.

SELEUCUS I., surnamed NICATOR, the first of this line, was the son of Antiochus, a distinguished officer in the service of Philip of Macedon, and was born about 358 B.C. He was one of the conspirators against Perdiccas, and in the second partition of the provinces of Alexander the Great's kingdom, obtained Babylonia, to which, with the aid of Antigonus, he subsequently added Susiana; but a misunderstanding with that powerful chief having arisen, Seleucus took refuge in Egypt (316 B.C.). The victory gained by Ptolemy over Antigonus's son, Demetrius, at Gaza having laid open the route to the East, Seleucus returned to his satrapy, amidst the joyous congratulations of his subjects (312 B.C.). From October 1 of this year (the date of Seleucus's return to Babylon), commences the era of the *Seleucidæ*. Having next recovered Susiana, he conquered Media, and extended his power to the Oxus and Indus. Of his campaign against Sandrocottus (q. v.), there are few details extant. In 306 B.C., he assumed the regal title; and four years afterwards, joined the confederacy of Ptolemy, Lysimachus, and Cassander, against the now formidable Antigonus, deciding the battle of Ipsus (301 B.C.) chiefly by his cavalry and elephants. Being now, after Antigonus's death, the most powerful of Alexander's successors, he obtained the largest share in the conquered kingdom, a great part of Asia Minor and the whole of Syria falling to him. Towards the close of his reign, war broke out with Demetrius (now his father-in-law), and afterwards with Lysimachus, king of Thrace and the other part of Asia Minor, both contests terminating in the defeat and death of his opponents, and being followed by the acquisition of the rest of Asia Minor. He was assassinated (280 B.C.) by Ptolemy Ceraunus.

Of Seleucus's personal character, little can be gathered from the fragments of his history which remain to us; according to Pausanias, he was the most upright of Alexander's successors, unstained by those crimes which have foully blotted the characters of the others; but of his consummate generalship and great political talents, we have sufficient proof. He pursued with great zeal the plan of 'Hellenizing' the East, by founding numerous Greek and Macedonian colonies in various parts of his dominions; he also built numerous cities, several of which—as Antioch in Syria, and Seleucia on the Tigris—rose to be among the most populous and wealthy in the world.—After the reigns of ANTIOCHUS I. (q. v.) and ANTIOCHUS II. (q. v.), SELEUCUS II. (246—226), surnamed CALLINICUS, obtained the throne; but having, at the instigation of his mother Laodice, murdered his stepmother Berenice, an Egyptian princess, he was driven from his kingdom by Ptolemy Euergetes (q. v.). However, he recovered his throne on Ptolemy's withdrawal; and though defeated in a great battle with the Egyptians, he succeeded in maintaining his hold of Syria and most of Asia Minor against both the Egyptians and his younger brother Antiochus, who exercised independent authority over part of Asia Minor. Antiochus was at a later period wholly defeated in Mesopotamia, and soon after murdered by robbers. Seleucus undertook a great expedition against the revolted provinces of Parthia and Bactria, but was totally routed by Arsaces I., king of Parthia; while, on the north-west, several provinces were wrested from him by Attalus, the king of Pergamus.—His sons, SELEUCUS III. (226—223), surnamed CERAUNUS, and ANTIOCHUS III. (q.v.), 'the Great,' were his successors, the latter being the first of the dynasty who came into collision with the Romans.—SELEUCUS IV. (187—175), surnamed PHILOPATOR, was eager to dispossess the king of Pergamus of the provinces which he had taken from the Syrian monarchy, but fear of the Romans prevented him from carrying out his design.—ANTIOCHUS IV. (q.v.), EPIPHANES (I.) ('the Illustrious'), conquered Cœle-Syria and Palestine from the Egyptians, to whom they had been given by his father; but retired from Egypt at the bidding of the Romans.

He practised the most atrocious cruelties on the Jews, whose religion he endeavored to root out, and introduce the Greek religion; but the heroic resistance of the Maccabees (q. v.) completely foiled his project. He died in a state of raving madness, which was attributed to his sacrilegious crimes by his subject, who, in derision, converted his surname into EPIMANES ('the Madman').—The succeeding names of the dynasty were: ANTIOCHUS V., EUPATOR (164—162); DEMETRIUS I., SOTER (162—150), who regained Babylon, lost Judea, and was defeated and slain by the impostor Alexander Balas (150—146); DEMETRIUS II., NICATOR (146—138, 128—125), who overthrew the impostor, and was himself taken prisoner by the Parthians. Syria having been already seized by DIODOTUS, surnamed TRYPHON, who set up the puppet ANTIOCHUS VI., THEOS (144—142), and afterwards ascended the throne himself (142—137); ANTIOCHUS VII., SIDETES (137—128), who restored the royal line of the Seleucidæ; ANTIOCHUS VIII., GRYPUS (125—96), who was compelled to share his dominions with his half-brother ANTIOCHUS IX., CYZICENUS (111—95); SELEUCUS V. or VI., EPIPHANES (96—94), and ANTIOCHUS X., EUSEBES (95—83), who continued the division till 94 B.C., when the latter was victorious in a pitched battle, and seized the whole kingdom; for which, however, he was forced to fight with Philip, and ANTIOCHUS XI., EPIPHANES (II.), the younger brother of Seleucus; and DEMETRIUS III., EUCÆRUS (94—88), a third brother of Seleucus, who, with Philip, next claimed the sovereignty, which was taken from them by Tigranes (83—69), king of Armenia, at the solicitation of the Syrians; ANTIOCHUS XII., DIONYSUS, a fourth brother of Seleucus, and ANTIOCHUS XIII. (69—65), ASIATICUS. The short-lived prosperity of this dynasty, for it had begun to decline during the reign of SELEUCUS II., 80 years after its foundation, is principally owing to the fatal principle on which it was founded—viz., that of establishing a Græco-Macedonian power in a foreign country, instead of conciliating the attachment of the native populations, and governing them more in accordance with the Eastern method; the consequences were the successive revolts of the natives, the foundation of the independent and hostile kingdoms of Bactria, Parthia, Armenia, Judea, and the ultimate conversion of the small remnant into a Roman province by Cneius Pompeius, 65 B.C.

SELF-DENYING ORDINANCE, a measure carried through parliament in 1645 by the influence of Cromwell and the Independents, with the view of removing Essex and the Presbyterians from the command of the army. It was moved by a fanatic of the name of Zouch Tate, who, on the ground that 'there is but one way of ending so many evils, which is, that every one of us freely renounce himself,' proposed, that 'no member of either House shall, during this war, enjoy or execute any office or command, civil or military, and that an ordinance be brought in accordingly.' The ordinance, which was clearly intended to take the executive power out of the hands of the more moderate politicians, and form an army independent of parliament, was the subject of violent and protracted debate, but eventually passed in both Houses, and became law. The consequence was that Essex, Warwick, Manchester, and others gave in their resignation, and the conduct of the war was intrusted to Fairfax; Cromwell, to whom, as a member of the Lower House, the self-denying ordinance extended, as much as to Essex and the rest, had the duration of his commission prolonged by the Commons on account of his invaluable services as a leader of cavalry, and by his brilliant achievements soon surpassed his commander in reputation.

SELIM I., Sultan of Turkey, son of Bajazet II., was born in 1467, dethroned his father by the aid of the Janizaries, 25th April 1512, and ascended the throne. To secure himself in his elevation, he caused his father, brothers, and nephews to be put to death, thus beginning a policy which he pursued inflexibly through the whole of his subsequent career, viz., to destroy without scruple every actual or possible obstacle to the accomplish-

ment of his own ends. Urged on by a devouring appetite for conquest, and by the warlike fanaticism of the Janizaries, he declared war (1514) against Shah Ismail of Persia, and marched eastwards with an army of 250,000 men, massacring on the way 40,000 Shiites. He encountered Ismail at Calderoon, and defeated him with immense loss, but a spirit of disaffection breaking out in his army, he was compelled to content himself with this success, which gave him possession of Diarbekir and Kurdistan. In the following year he overran Armenia; and leaving his lieutenants to complete this conquest, he marched against the Mameluke Sultan of Egypt, whom he had previously endeavored to detach from intimate alliance with the Persian monarch. Kansû-ghori, the Egyptian Sultan, was totally defeated (1516) at Marjabik by S., and Syria became the prize of the victor; and Kansu's successor, Touman-Bey, was still more unfortunate, his army being almost extirpated (1517) at the battles of Gaza and Rudania. The victorious Turks then entered Cairo without opposition; Touman-Bey and his chief supporters were put to death, and Egypt incorporated with the Ottoman empire.

The last lineal descendant of the Abbaside calif, who was then resident in Egypt, transmitted to S the religious prestige which had devolved upon himself by descent, and at the same time bestowed upon him the title of 'Imaum,' and the standard of the Prophet. In consequence of this gift, the Ottoman sultan became the chief of Islam, as the representative of Mohammed; and the sacred cities of Mecca and Medina, along with the chief Arabian tribes, in consequence acknowledged his supremacy. Thus, in less than four years, S. did more to extend the Ottoman empire than any of his most renowned predecessors during a whole reign. He also laid the foundation of a regular marine, constructed the arsenal of Pera, chastised the insolence of the Janizaries with savage severity, and labored to ameliorate, by improved institutions, the condition of the various peoples he had conquered. He died 22d September 1520, while planning fresh campaigns against both Persians and Christians. This prince, who in a sense merited his title of *Yavuz* (the Ferocious), was nevertheless a lover and encourager of literature, and even himself cultivated the poetic art. S. was succeeded by his son, Solyman the Magnificent (q. v.).

SELIM III., Sultan of Turkey, the only son of Mustapha III., was born 14th December 1761, and ascended the throne on the death of his uncle, Abdul-Hamid, in 1789. Seeing clearly the causes of the decadence of the empire, and the proper remedies, he inaugurated a policy of renovation and progression; but the war with Russia, in which his newly raised army of 150,000 men was totally defeated, first by the Prince of Coburg, and next by Suwarof, put a stop for a time to his schemes of reform. He was compelled, in 1791, to cede Choczim to Austria, and in the following year, all his possessions beyond the Dniester to Russia. About this time, his good harmony with Napoleon was troubled by the expedition of the French to Egypt, and subsequently by the question of the recognition of the French Empire, but on the whole, S. continued the faithful ally of France; and at every opportunity pursued with ardor his various reforms, establishing cannon-foundries, and organizing a body of troops ('the Nizam-Djedit'), armed, clothed, and disciplined in the European fashion; but this last reform stirred up against him (1805) all the fanatic bigotry of his subjects.

The priests of Islam even preached revolt in different parts of the empire, and accused their sovereign of despising the holy injunctions of the Koran, so that S. felt compelled to adopt a more cautious policy. At length, a formidable rebellion broke out, and the Nizam-Djedit, who attempted to suppress it, were overpowered, their commander put to death, and the rebels marched into Constantinople, their ranks being swelled at every step by bodies of disaffected Janizaries. All those who had favored or forwarded the sultan's schemes were seized and put to death, and S. was compelled to issue a decree suppressing the new institutions. But the malignant enmity of the mufti and his coadjutors was not thus to be satisfied, and S. saw himself forced to resign the throne (1807) to his cousin, *Mustapha IV.* (1807—1808).

On the news of this insurrection being conveyed to Mustapha-Bairaktar, the Pasha of Rustchuk, and one of the sultan's chief advisers, this energetic and able soldier marched upon Constantinople, with a view to reinstate S. on the throne, but on his arrival the unfortunate monarch was strangled, and his body cast at the feet of Bairaktar. See BAIRAKTAR. Thus perished S., and with him the first attempt at reformation in Turkey; the effects of which, however, were not wholly lost, for manufactures had begun to flourish, thousands of silk, and other looms were now in vigorous operation, a printing press had been established in Scutari, and many other improvements calculated to foster the prosperity and happiness of his subjects, had been inaugurated; though these advantages, the natural result of S.'s enlightened patriotism, were neither understood nor appreciated by the great majority of his ignorant and fanatical subjects.

SELI'MNO, a manufacturing town of European Turkey, in Eastern Roumelia, at the southern base of the Balkan Mountains, 78 miles north of Adrianople. Owing to its far inland position, there is little communication between the town and the coast, and consequently the annual fair held here is of very great importance. Arms, cloth, and attar of roses are manufactured. Pop. 15,000.

SELJUKS, or SELJUK-TURKS, were an offshoot of the Hoei-He or Hoei-Hu, a collection of tribes of Turkish race, who, being driven south-westward from the Chinese wall, had, in 744 A.D., overwhelmed that Turkish empire of Kiptchak which had given so much annoyance to the Sassanidæ (q. v.) during their reign in Persia. The Hoei-Hu rapidly extended their power from the Caspian Sea as far as the Hoang-ho, and at the time when the S. separated themselves from them, were ruled by a chief named Bigû Khan. Seljuk, from whom the S. derived their name, was the chief of a small tribe which had gained possession of Bokhara and the surrounding country. His sons, attracted by the beauty and fertility of Khorassan, began, about 1027, to migrate to that country, and after some struggles with the Ghiznevide sultans, established themselves in Northern Khorassan, with TOGRUL BEG, the eldest grandson of Seljuk, as their chief, and Nishapur as their capital. Togrul, leaving his brother in Khorassan, set out on his conquering march, subdued Balkh and Khaurezm in 1041, Irak-Ajemi in 1043, subsequently adding to these Kerman and Fars. He then advanced to Bagdad, which he took in 1055, dethroning the last vizier of the Dilemite (see SAMANI) dynasty, and being invested by the reigning calif with the vacant office, after which he completed his conquest of Persia, by the reduction of Irak-Arabi and Mosul about 1061. The S. were zealous Mohammedans, and Togrul Beg seems to have been a vigorous promoter of the faith which he professed, for he built numerous mosques, subsidized pions and learned men, and treated the calif —his spiritual chief—with profound respect.

After his death in 1063, his nephew, ALP-ARSLAN (q. v.), succeeded to supreme power, and became one of the most renowned monarchs of Asia. His son, MELEK SHAH (1073—1093), the most powerful monarch of this dynasty, added, by means of his generals, Arabia, Asia Minor, Armenia, Syria and Palestine, and Transoxiana to his empire, which now extended from the Hellespont to the borders of Chinese Tartary; and even the ruler of Cashgar acknowledged his authority. This empire, though extensive and ill-compacted, was preserved in the highest order and prosperity by his able minister, the virtuous Nizam-ul-Mulk, under whose firm, just, and wise government the rights of all classes were maintained, religion promoted, and learning encouraged, till the Persians who had dreaded the conquest of their country by the Turks as the worst of evils, were forced to confess that it had proved the greatest of blessings. In 1092, Melek Shah, lending an ear to the misrepresentations of Nizam-ul-Mulk's enemies, deprived him of his office; and the aged minister was soon afterwards assassinated by one of the followers of Hussun Subah, the chief of the Assassins (q. v.), and the mortal enemy of the good ex-vizier. Hospitals, caravansarais, bridges, roads, and canals attest the zeal with which the commercial interests of the empire were furthered; while the colleges of Bassora, Ispahan, and Herat, the law-college of Bagdad, and the observatory (the first in Asia) of the same city, indicate the care bestowed on the promotion of literature and science. Melek Shah, under whom the empire of the S. had attained the height of its power and splendor, laid a sure foundation for its rapid decline, by subdividing it into a number of separate principalities, all professedly subject to the central state of Iran or Bagdad. The chief of these principalities were: 1. The central state of *the S. of Iran*, whose ruler was the vizier of the calif, and exercised direct authority over Northern and Western Persia to the borders of the Arabian desert. The chief monarchs of this branch were Mohammed Shah, whose generals warred with the Crusaders in Palestine, and Sultan Sanjar, one of the most celebrated of the S. princes, great both in success and misfortune. This branch was annihilated in 1194 by the Shah of Khaurezm.

2. *The S. of Kerman*, who were annihilated in 1191 by the Ghuz Turkomans. 3. *The S. of Iconium*, who ruled over Asia Minor, and whose founder was Soliman, a great-grandson of Seljuk. This branch endured for 224 years—from 1075 to 1299—and during that period was engaged in numerous wars with the Byzantines and with the Crusaders, both of whom learned to dread its power. During its last years, it was tributary to the Mongols; and in 1299, the present Turkish empire rose on the ruins of its power (see OTHMAN). 4. *The S. of Aleppo*, who ruled from 1079 till their extinction in 1114. 5. *The S. of Mosul*, who was speedily supplanted by *attabegs*, or independent governors, of whom Zenghi, and his renowned son Noureddin (q. v.), were the most celebrated. 6. *The S. of Damascus*, an offshoot (1096) from the Aleppo principality, which lasted till 1155, when it was put an end to by Noureddin. 7. *The S. of Mardein*, who only appear in

common history as the allies of the S. of Iconium, Mosul, Aleppo, and Damascus, against the mighty crusading armies of Western Europe. And 8. *The S. of Khaurezm* (*Khiva*), who founded a great empire, including the whole of the country within the Jaxartes, the Bolar Mountains, the Indus, the Sea of Oman, and the Persian Gulf; but the last monarch, Allah-ed-din Mohammed Shah, having wantonly put to death some Mongol merchants who were pursuing their avocations within his dominions, was doomed to destruction by the terrible Genghis Khan (q. v.), who crossed the Sir-Daria, conquered Transoxiana, defeated Mohammed's armies, and drove the Shah himself to take refuge in an island of the Caspian, where he died. The advance of the Mongols was gallantly opposed by Mohammed's celebrated son, Jelal-ed-din, who twice defeated them; but being totally routed (1221), on the west bank of the Indus, by Genghis himself, he plunged his horse into the Indus, and safely reached the opposite bank, none of his enemies daring to follow him. The whole of this extensive empire now fell under Mongol domination.

SELKIRK, ALEXANDER. See JUAN FERNANDEZ.

SE'LKIRK, a Scottish royal burgh, capital of the county of the same name, on an eminence overlooking Ettrick Water and the famous field of Philiphaugh, where General David Leslie defeated Montrose and crushed the cause of King Charles in Scotland, 40 miles by the North British Railway south-south-east of Edinburgh. The county buildings (opened 1870), the old town-hall, with a spire 110 feet high, and the monuments to Sir Walter Scott and to Mungo Park, are the principal architectural features. S. has large woollen mills. Tweeds, hosiery, and blankets are the chief articles of manufacture. Pop. (1881) 6090. S. joins with Hawick and Galashiels in sending one member to parliament. S. commands a splendid view across the valley or haugh in which the Ettrick and Yarrow meet. It is within a few miles of many of the most famous localities in Scotland, and is a favorite starting-point for tourists desirous of exploring the 'Scott' country, the 'Forest,' the Yarrow, and St. Mary's Loch. Upwards of a hundred fighting men went from S. to join King James in his fatal march to Flodden; of these, only four returned, but they proudly bore a standard taken from the enemy on that occasion. The manufacture of 'single-soled shoon' long flourished here, and the 'Souters of Selkirk' are commemorated in song and story.

SELKIRKSHIRE, in ancient times called Ettrick Forest, is bounded by the counties of Midlothian, Roxburg, Dumfries, and Peebles, on the N., E., S., and W. respectively. It extends in length from north to south about 28 miles, and from east to west 16 to 18 miles, and consists mainly of the two parallel valleys through which flow the rivers Ettrick and Yarrow. Its area is 260 sq. m., or 166,524 acres. S. contains three entire parishes, and parts of other seven. It is in a great measure a pastoral county, and some of the hills are of considerable altitude, being upwards of 2000 feet in height. The hills are rounded at the top instead of peaked, and are covered generally with grass affording excellent pasturage, but in some places with heather. The arable land, situated from nearly 300 to 800 feet above sea-level, and bearing the proportion of about one-eighth of the area, is, in general, of a light soil, and produces the ordinary crops in abundance. Besides the Ettrick and Yarrow, the Tweed, Gala, and Caddon flow through parts of the county. The banks of several of these are beautifully wooded; but the extensive woods from which the county originally took its name of the Forest have disappeared. According to the agricultural returns for 1880, the acreage under permanent pasturage (exclusive of heath and mountain land) was 6630; that of corn crops was 5250, including 16 acres of wheat, 771 acres of barley, and 4442 acres of oats; that of green crops was 3230, embracing 2812 acres of turnips, 224 acres of potatoes, and 156 acres of cabbage, kohlrabi, and rape. The acreage under hay and grass, not included under permanent pasturage, was 7837.

The average of produce is above that of most of the other counties. Of horses, there were 556; of cattle, 2629; of sheep, 167,239; of swine, 335—total stock, 170,759. The old valued rent was £6692. The new valuation, including the burgh, is about £110,000. This county contains some historical scenes, among which is the field of Philiphaugh, where the Marquis of Montrose was defeated by the Covenanters under General Leslie. Oakwood Castle, in ruins, was the residence of the famous wizard, Michael Scott; and Newark, also in ruins, was the residence of Anne, Duchess of Buccleuch, where the *Lay of the Last Minstrel* is represented by Scott as having been sung. S. is pretty well appointed for roads. The Hawick line of the North British Railway runs for a short distance along its border, from which, at Galashiels, there is a branch to Selkirk; and the North British line from Edinburgh to Peebles passes through its northern end from Innerleithen to Galashiels, a distance of about 12 miles. There are several places of worship, belonging to the Establishment, the Free Church, and various other dissenting bodies. There is no coal, or lime, or sandstone. The Douglas family, four centuries ago, were the principal proprietors. The Duke of Buccleuch now holds about two-thirds of it. The population in 1871 was 18,572, and in 1881 it was 25,564. S. and Peeblesshire conjoined return one member to parliament.

SE'LTERS WATER (commonly but incorrectly written *Seltzer Water*), takes its name from the village of Lower Selters near Limburg, in the duchy of Nassau, where several springs united, in one basin, yield 5000 cubic feet an hour of this sparkling and effervescing mineral water. Its chief ingredients are carbonic acid, carbonate of soda, and common salt. It acts as a mild stimulant of the mucous membranes and as a diuretic; and is applied in chronic disorders of the digestive, respiratory, and urinary organs. It is much recommended as a beverage, either alone or with sugar, to those suffering from liver complaint, and in hot climates and seasons. More than 1½ millions of jars or bottles of this famous water are exported yearly to all quarters of the world, affording to the state a revenue of above £6000. The spring was discovered early in the 16th c., but was at first so little prized, that in the middle of the 18th c. it was rented for 4*s*. The water is little drunk at the springs. Artificial Selters Water is extensively manufactured both on a large scale and for domestic use. See AERATED WATERS.

SE'MAPHORE (from *sema*, a sign, and *phero*, I bear) was the name applied to the system of telegraphy in use before the application of the electric current. Semaphores were first established by the French in 1794, as a plan for conveying intelligence from the capital to the armies on the frontier. In the following year, Lord George Murray introduced them in England; and by their means the Board of Admiralty were placed within a few minutes of Deal, Portsmouth, or Plymouth. These semaphores consisted of towers built at intervals of from 5 to 10 miles, on commanding sites. On the top of each tower was the telegraph apparatus,

Semaphore.

which at first comprised 6 shutters arranged in 2 frames, by the opening and shutting of which, in various combinations, 63 distinct signals could be formed. In 1816, Sir Home Popham substituted a mast with 2 arms, similar to many of the present railway signals. The arms were worked from within the tower by winches in the look-out room, where a powerful telescope in either direction constantly commanded the mast of the next station. If a fog set in at any point on the route, the message was delayed; otherwise, when a sharp look-out was kept, the transmission was very rapid. For instance, the hour of one by Greenwich time was always communicated to Portsmouth when the ball fell at Greenwich; the semaphores were ready for the message, and it commonly passed from London to Portsmouth and the acknowledgment back to London within three-quarters of a minute. Each station was in the charge of a naval officer—usually a lieutenant—with one or two men under him. To save the cost of this establishment, the Deal and Plymouth lines fell into disuse soon after the peace of 1815; and the superior advantages of the electric telegraph being incontestable, the Portsmouth line sent its last message on the 31st December 1847, and, on land at least, the semaphore closed its career of usefulness for ever. In calm weather, when flags will not extend, semaphores are employed on board ship as a means of signalling from vessel to vessel, or to the shore; in such a case, the post containing the arms is movable, and can be readily shipped or unshipped near the stern. See also SIGNALS.

SE'MÉ, in Heraldry. When a charge is repeated an indefinite number of times so as to produce the appearance of a pattern, the term *semé* (sometimes *aspersed* or *powdered*) is applied to it. When a field is semé, it is treated as if it were cut out of a larger extent of surface, some of the charges being divided by the outline of the shield. The term *crusilly* denotes semé of cross crosslets, and *billetty* semé of billets.

Semé.

SEMECA'RPUS, a genus of trees of the natural order *Anacardiaceæ*. The MARKING NUT of India is *S. anacardium*, a tree 50 feet high, growing on mountains. The swollen receptacle of the flower becomes a succulent fruit, eatable when roasted, but

astringent and acrid when raw. On the receptacle is seated the nut, which is heart-shaped and black, consisting of a kernel—not unwholesome, although rarely eaten—surrounded by two skins, between which is a black acrid juice. This juice is used in medicine as an external application to heal rheumatism, &c. It is also in general use in India for marking cotton cloth; and the color is improved, and running prevented, by the addition of a little quicklime and water. The wood of the tree contains so much acrid juice that it is dangerous to work upon.

SE'MELE. See BACCHUS.

SE'MENCINE, SEMEN CINÆ, AND SEMEN CONTRA. See ARTEMISIA.

SEME'NDRIA, a frontier fortress of the principality of Servia (q. v.), stands amid romantic scenery on the right bank of the Danube, 28 miles south-east of Belgrade. The inhabitants, about 12,000 in number, are employed principally in the wine-culture, in breeding hogs, and in general trade. It was at one time the seat of the Servian kings; and it has been frequently stormed by the nations who have contended for the Danube from the middle ages to the present century.

SE'MIBREVE, in Music, a note of half the duration of the breve of old ecclesiastical music, but the longest note in use in modern music. It is represented by a character circular or elliptical in form  and is adopted as the integer or measure-note, the other notes—minim, crotchet, quaver, &c.—being proportional parts of it.

SEMI-DEMI-SEMIQUAVER, a musical note, of which 8 are equivalent to a quaver, 32 to a minim, and 64 to a semibreve. It is represented thus, or in groups thus,

SE'MINOLES, a tribe of American Indians, originally a vagrant branch of the Creeks, whose name, Seminole, signifies wild or reckless. In 1705, they aided in driving the Appalaches from Florida; and in 1817, they joined with the Creeks and some negroes who had taken refuge with them, ravaged the white settlements in Georgia, plundering plantations, and carrying off slaves, whom they refused to surrender. General Jackson, sent to punish them, took at the same time several Spanish forts, and hastened the negotiations which ended in the cession of Florida to the United States. At this cession in 1823, the S. engaged to retire into the interior, and not molest the settlers; but as the negroes continued to take refuge with them, a treaty was made with some of the chiefs, in 1832, for the removal of the whole tribe west of the Mississippi. This treaty was repudiated by the tribe, at the instigation of Osceola (q. v.), one of their chiefs; and a war commenced against a handful of savages, which lasted eight years, and cost thousands of lives, and ten millions of dollars. In the end, the remains of the tribe were removed to the Indian Territory on the borders of Arkansas.

SEMIPALATI'NSK, an extensive Russian territory in Central Asia, is bounded on the E. and S. by Tomsk, the Chinese empire, and Turkestan. Area, 170,000 sq. m.; pop, (1880) 526,000. It is separated from Turkestan on the south by the Alexandrian Mountains in lat. 42° 30′ N., and it is traversed by several other mountain chains. The chief rivers are the Irtish, Ili, and Chui; and among the lakes are those of Issik-Kul, Ala-Kul, and Balkash. The country abounds in pasturage, and cattle form almost the sole wealth of the inhabitants, although the precious metals, together with lead and copper, are found. Steamers ply on the great rivers and lakes.—Semipalatinsk, the capital, stands on the left bank of the Irtish, in lat. about 50° 15′ N. It is the seat of an important transit-trade, and contains (1880) 14,200 inhabitants.

SEMI-PELA'GIANISM, a modification, as the name implies, of the doctrine of the Pelagians as to the powers of the human will, and as to the effects to be attributed to the action of the supernatural grace of God, and of the divine decree for the predestination of the elect. The Pelagians (q. v.), discarding altogether the doctrine of the fall of Adam, and the idea that the powers of the human will had been weakened through original sin, taught that man, without any supernatural gift from God, is able, by his own natural powers, to fulfil the entire law, and to do every act which is necessary for the attainment of eternal life. The condemnation of this doctrine by the several councils held in the early part of the 5th c. is capable of various constructions, and has been urged by some to the extreme of denying altogether the liberty of man, and converting the human will into a merely passive instrument, whether of divine grace upon the one hand, or of sinful concupiscence upon the other. The writings of St Augustine on this controversy have been differently construed by the different Christian Communions (see PELAGIANS); and the same diversity of opinion existed in his own day.

Among those who, dissenting from the extreme view of Pelagius, at the same time did not go to the full length of the Augustinian writings in opposition to Pelagius, were some monks of the southern provinces of Gaul, and especially of Marseille whence their school was called Massilian, from the Latin name (*Massilia*) of that city. Of these leaders, the chief was a priest named Cassian, who had been a deacon at Constantinople. Of the system which he propounded, without going into the details, although many of them are exceedingly curious and interesting, it will be enough to say that it upheld the sufficiency of man's natural powers only so far as regards the first act of conversion to God and the initial act of man's repentance for sin. Every man naturally possesses the capability of beginning the work of self-conversion; but for all ulterior acts, as well as for the completion of justification, the assistance of God's grace is indispensable. The Semi-Pelagian doctrine is often confounded with that of the Molinistic (see MOLINA) school of Roman Catholic theology; but there is one essential difference, viz., that the latter persistently maintain the necessity of grace for all supernatural acts, even for the beginning of conversion, although they are generally represented as agreeing with the Semi-Pelagians as to the mode of explaining the freedom of the human will acting under the influence of divine grace. The chief writers in the controversy were Prosper, Hilary, and Fulgentius; and the question was referred to Celestine, Bishop of Rome in 431. It continued, however, to be agitated in the West for a considerable time. Faustus, Bishop of Riez, towards the end of the 5th c., revived the error, and it was condemned in a council held at Arles in 475, and still later in a synod (the second) held at Orange (Arausio) in 525, and again in the third council of Valence in 530.

SEMIPLE'NA PROBA'TIO, in Scotch Law, is that kind of half-proof, half-suspicion which was usually given in cases of affiliating a bastard, as well as in a few other cases. It was a species of *primâ facie* evidence; and when considered by the court sufficient, it was eked out by the oath of the party, called an Oath in Supplement. The practical effect of the admission of parties as witnesses, under 16 Vict. c. 20, has been to do away with Oaths in Supplement, the parties being usually the principal witnesses, and the court deciding from a consideration of the balance of credibility between them.

SE'MIQUAVER, a musical note, represented thus, or in groups thus,  equivalent in value to $\frac{1}{2}$ of a quaver, $\frac{1}{4}$ of a crochet, $\frac{1}{8}$ of a minim, or $\frac{1}{16}$ of a semibreve.

SEMI-QUI'ETISM, a form of mystical asceticism which, while it adopts the theoretical principle, that the most perfect state of the soul is that of passive contemplation, and denies, in certain conditions of the soul, the necessity of prayer or other active manifestations of virtue, yet maintains the incompatibility of this passive contemplation with any external sinful or sensual action. The Semi-Quietists thus differed from the grosser sectaries referred to under QUIETISM.

SEMI'RAMIS. See ASSYRIA.

SEMITIC. See SHEMITIC.

SE'MITONE, in Music. The name given to the smaller intervals in the diatonic scale, as E F or B C, in which the ratio is as 15 to 16.—In the pianoforte, the interval between any two notes between which no other note is interposed, as C to C♯ or B♭ to B, is a semitone.

SEMLER, JOHANN SALOMO, one of the most influential German theologians of the 18th c., was born, 18th December 1725, at Saalfeld, where his father was archdeacon, educated at Halle, and in 1749 went to Coburg as professor at the gymnasium. In 1751, he was appointed a Professor of Theology at Halle, where he taught with great success; and six years later, became director of the theological seminary there. He died 14th March 1791. S. was, in the early part of his student-career, somewhat of a Pietist, but the prelections of Sigm. Jak. Baumgarten may be said to have revolutionized his religious convictions, and swung him round to rationalism, of which he was the first systematic exponent. S.'s rationalism, however, was always moderate in *degree*, though definite enough in *kind*. As a thinker, he was deficient in philosophical consistency and breadth of view; and as a writer, he possessed no literary skill or grace; but his works are valuable for the spirit of historical criticism by which they are pervaded. The principal are: *Apparatus ad liberalem Veteris Testamenti Interpretationem* (Halle, 1773), *Abhandlung von der Untersuchung des Kanons* (4 vols., Halle, 1771—1775), *De Dæmoniacis* (Helle, 1760), *Umständliche Untersuchung der Daemonischen Laute* (Halle, 1762), *Versuch einer Biblischen Daemonologie* (Halle, 1776),

Selecta Capita Historiæ Ecclesiasticæ (3 vols., Halle, 1767—1769), *Commentationes Historicæ de Antiquo Christianorum Statu* (2 vols., Halle, 1771—1772), *Versuch Christlicher Jahrbücher oder ausführliche Tabellen über die Kirchengeschichte bis aufs Jahr.* 1500 (2 vols., Halle, 1783—1786), *Observationes novæ, quibus Historia Christianorum usque ad Constantinum Magnum illustratur* (Halle, 1784).—See his *Lebensbeschreibung von ihm selbst verfasst* (Halle, 1781—1782), Schmid, *Theologie Semler's* (1858), and Tholuck in his *Vermischte Schriften.*

SEMLIN, a frontier town of Austria, in the Croatian-Slavonian Frontier (till of late the Military Frontier), stands on a tongue of land at the junction of the Save and Danube, on the right bank of the latter, opposite Belgrade. Within recent years, the town has been much improved, though even yet a suburb consisting of mud huts thatched with reeds stretches along the Danube. The only noteworthy edifices are the churches, the German theater, and the Lazaretto (*Contumaz*), the chief quarantine station in the whole of the Military Frontier. At this institution, travelers crossing from Turkey are compelled to remain a greater or less time—sometimes 40 days—in proportion to the violence and proximity of the plague. The reason why the principal Lazaretto is here is, that S. is the great seat of the Turco-Austrian transit-trade, and the principal ferry for passengers from Christendom to the land of the Moslem. Pop. (1880) 9500.—For a graphic notice of S., see Kinglake's *Eothen.*

SEMMERING, a mountain on the borders of Styria and Austria, and 44 English miles south-west-by-west from Vienna, is 4416 feet above the level of the sea. The Vienna, Grätz, and Trieste Railway has been carried across this mountain by a series of ingenious engineering contrivances. See GLOGGONITZ.

SEMMES, RAPHAEL, American naval officer was born in Maryland about 1810, in 1828 entered as midshipman in the sloop-of-war *Lexington*, and was employed in the service as passed midshipman and lieutenant until 1855, when he attained the rank of commander. In 1858, he was appointed Secretary to the Light-house Board; but resigned March 26, 1861, joined the naval service of the Confederate States, and was appointed to the command of the war-steamer *Sumter.* The career of Captain S. until the sinking of his famous ship, the *Alabama*, by the American war-steamer *Kearsage*, is described at length in the article ALABAMA. Captain S., with 13 officers and most of his men, was rescued from drowning by the yacht *Deerhound*, and brought to England, where he expected to take command of one of two rams built at Liverpool for the Confederates, but which were seized by the British government. He returned to America, was included in the surrender, and was elected Judge of Probate at Mobile, Alabama; but, being prohibited by the Federal authorities, he was, in 1866, appointed Professor of Moral Philosophy in the southern university. He published the *Cruise of the Alabama and the Sumter*, in 1864; and *My Adventures Afloat* in 1869.

SEMNOPITHE'CUS, a genus of monkeys, natives of the East, having a very long, slender, powerfully muscular, although not prehensile, tail. The canine teeth are long, but the molar teeth are more tuberculous than in Gibbons (q. v.) and other allied monkeys, indicating a greater aptitude for vegetable food. With this the structure of the stomach corresponds, which is very remarkable, and different from that of all other animals; consisting of a cardiac pouch, slightly bifid at the extremity; a very wide middle portion, formed of numerous pouches or sacs; and a very long canal, furnished with sacs at its commencement, but simple towards its termination. Professor Owen has been careful, however, to point out that these three portions do not correspond to any of the parts of the stomach of a ruminant animal, not exhibiting any such diversities in their internal surface. The species are numerous. The Entellus (q. v.) Monkey is one of them. Another is the Negro Monkey (*S. Maurus*) of Java, remarkable for its jet-black color and long silky hair.

SEMOLI'NA (Semola or Semoule), an article of food much used in France and Italy, and to a small extent in Britain, and other countries. It consists of particles of wheat varying in size from grains of sand to small millet. Only the hard-grained wheats of Spain, Odessa, and Southern Italy are adapted for making it; these hard wheats are not easily reduced to flour, and small particles escape being crushed by the mill-stones, and will not pass through the sieves—these constitute semolina. In France, more attention is paid to this article than in any other country; and as it fetches a higher price than flour, the skilful miller so adjusts his mill-stones as to produce a considerable quantity. The granules of Semolina are of various sizes, and they are carefully separated by sieves, the openings of which are from fine to coarse. A favorite kind of bread made of the coarser kinds of semolina—the semoule of the French—is sold in Paris under the name of *gruau.* In Italy, it is used in making polenta, in common with maize, meal, and millet; and in Britain it is used for puddings.

SE'MPACH, a small town of Switzerland, in the canton of Lucerne, and 9 miles by railway north-west of the town of that name, stands on the east shore of the lake of Sempach. It is surrounded with walls, now in a ruinous condition, has a population of a little over 1000, and was one of the outposts of the confederate cantons against their Swabian and Austrian assailants in the 14th century. Under the walls of S. took place the second great conflict of the confederated Swiss cantons with Austria. Leopold's army of 4000 horse and 1400 foot arrived before S. on the 9th July 1386, and found itself unexpectedly opposed by the confederated Swiss to the number of 1300. The nature of the ground being unfitted for the action of cavalry, the knights dismounted, and formed themselves, into a solid and compact body, which was at once charged by the Lucerners; but the wall of steel was impenetrable, and not a man of the Austrians was even wounded, while 60 of the bravest of Lucerne with their landamman fell. The mountaineers were beginning to despair of making an impression on their apparently invulnerable opponents, when Arnold von Winkelried, a knight of Unterwalden, seized with a noble inspiration, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom and bore them by his weight to the earth. His companions rushed over his body into the breach thus made, slaughtered the armor-encumbered knights like sheep, and threw the remainder into the utmost confusion and dismay. The conflict continued in an irregular manner for some time longer, but the result was a decisive victory for the Swiss, who had lost only 200 men; while the loss of the Austrians was ten times as great, including 600 counts, barons, and knights. The body of Duke Leopold, who had throughout displayed the most obstinate valor, was found next day buried among a heap of slain. The anniversary of this great victory is still celebrated by prayer and thanksgiving on the field of battle.

SEMPERVI'VUM. See HOUSE-LEEK,

SENATE. See ROME.

SENA'TUS ACADE'MICUS, one of the governing bodies in the Scottish universities, consisting of the Principal and Professors. It is charged with the superintendence and regulation of discipline, and the administration of the university property and revenues, which last function, since the Universities Scotland Act of 1858, the Senatus exercises subject to the control and review of the University Court. Degrees are conferred by the Senatus through the Chancellor or Vice-chancellor. The Principal is president, and besides his deliberative vote, has a casting-vote. In his absence, the senior professor present acts as chairman, who has also a double vote. One-third of the Senatus is required to form a quorum.

SENDOMIR or SANDOMIR MOUNTAINS. See RADOM.

SE'NECA, M. ANNÆUS, the rhetorician, was born at Corduba (Cordova) in Spain. The time of his birth is doubtful, probably about 61 B.C. He seems to have been in Rome during the early period of the power of Augustus. He was rich, belonged to the equestrian order, and enjoyed the friendship of many distinguished Romans. From Rome he returned to Spain, where he married Helvia, and had by her three sons. The time of his death is uncertain; but he probably lived till the close of the reign of Tiberius, and died in Rome or Italy. His extant works are *Controversiarum Libri X.*, and *Suasoriarum Liber*, neither of which is complete. They are elaborately rhetorical in style, but do little to support the fame of their author, who is more remembered for his prodigious memory than for anything else,

SENECA, L. ANNÆUS, son of the preceding, and a celebrated philosopher, was also born at Corduba, a few years B.C. When a child, he was brought by his father to Rome, where he was initiated in the study of eloquence. He cared more, however, for philosophy, in which his first teacher was the Pythagorean Sotion, whom he afterwards left to follow Attalus the Stoic. He traveled in Greece and Egypt; and, in obedience to his father's wishes, he pleaded in courts of law; but notwithstanding his forensic triumphs, he left the bar from fear of Caligula's jealousy. On entering into public life, he filled the office of quæstor, and had already risen high in the favor of the Emperor Claudius, when he was accused of an adulterous connection with Julia, the daughter of Germanicus, and wife of Vinicius. He was exiled to Corsica, where he remained for eight years, deriving from philosophy what consolation he could, while incessantly complaining with a by no means philosophic querulousness, and appealing to the emperor for pardon. When Claudius married his second wife, Agrippina, S. was recalled by her influence, raised to the prætorship, and appointed instructor of her son Nero. On the death of his governor and military tutor, Burrus, Nero gave way to his depraved passions with a force which S. could not control. All his influence over his pupil was lost, but he profited by his extravagant bounty to such a degree that his accumulated wealth amounted to 300,000 sestertia, or to £2,421,870 of our money. Nero soon began to

look with envious eyes on this fortune; and S., to avert dangerous consequences, offered with much tact, to refund to the emperor his gifts, and begged leave to retire on a small allowance. This Nero declined; and S., under pretence of illness, shut himself up, and refused to appear in public. Nero then attempted to have him poisoned, but failed.

A short time afterwards, Antonius Natalis, when on his trial for participating in the conspiracy of Piso, implicated S. as one of the conspirators. This was quite enough to fix S.'s guilt. He was sentenced to put himself to death. His wife, Paullina, declared her resolution to die with him, and, in spite of his remonstrances, accompanied him into the bath in which, according to his own choice, he was to be bled to death. The emperor, however, would not allow Paullina to die, but removed her from her husband, who gradually expired, 65 A.D. S.'s extant writings are mainly on moral subjects, and consist of Epistles, and of treatises on Anger, Consolation, Providence, Tranquillity of Mind, Philosophical Constancy, Clemency, The Shortness of Life, A Happy Life, Philosophical Retirement, and Benefits. He also speculated on physical phenomena, and wrote seven books entitled *Quæstiones Naturales*, in which he is thought to have anticipated some notions regarded as principles in modern physics. Ten tragedies, ascribed to him by Quintilian, and generally included in editions of his works, have also come down to us; but whether he is really their author remains still a dubious and debated point. Some allege that they were the work of his father, Seneca the rhetorician; some that they must be attributed to another Seneca. They were not intended, and are certainly not adapted for the stage. They are overcharged with declamation; and, if rich in moral sentiments, are wanting in dramatic life. Of his genuine prose writings, modern opinion takes a divided view; some critics praising his practical sagacity, others finding him wanting in speculative reach. It is perhaps a significant fact, that he is admired by French scholars, and disparaged by German. One of the best editions of the prose works is the Bipontine, 1809; of the tragedies, that of Bothe, 1819.

SENECA LAKE, one of a range of narrow lakes in the western part of the state of New York, U. S. It is 37 miles from north to south, and from 2 to 4 miles in width, 441 feet above the Atlantic, 630 feet deep, and was never known to be frozen over until March 1856. It is navigated by steamboats from its head to the pretty village of Geneva at its mouth, and empties itself by the Seneca and Oswego rivers into Lake Ontario. It takes its name from the Seneca Indians, one of the Six Nations.

SENE'CIO, a genus of plants of the natural order *Compositæ*, suborder *Corymbiferæ*, having a hairy pappus, a naked receptacle, and a cylindrical involucre of linear equal scales, with a few smaller scales at their base. The species are very numerous; annual, perennial, and half-shrubby plants, natives chiefly of the temperate and cold parts of the world, the half-shrubby species being from the warmer latitudes. Eleven species are reckoned as British, and commonly known as Groundsel (q. v.) and Ragwort (q. v.). *S. Saracenicus*, probably not a true native of Britain, but introduced in the middle ages, has undivided lanceolate leaves, and was once in repute as a vulnerary. The FIREWEED of North America is *S. hieracifolius*. It receives its popular name from its appearing abundantly wherever a part of the forest has been consumed by fire. Many species of S. have a strong disagreeable smell. A few are rather ornamental as flowers.

SENE'FFE, or SENEF, a town in the province of Hainault, Belgium, about 11 miles north-west of Charleroi, has a pop. of between 3000 and 4000, and is the center of a district in which manufactures of pottery and glass are extensively carried on. S., however, is chiefly notable for its proximity to the battlefield on which William of Orange (III. of England), at the head of the forces of the coalition against France, was defeated, after a bloody contest, by the Great Condé, 11th August 1674. In William's army there were four lieutenants—Montecuculi (q. v.), Duke Charles of Lorraine, the Prince of Waldeck, and the Prince of Vaudemont, the first three of whom subsequently attained prominence as military commanders. Of the allied forces of 60,000 men, the Dutch lost from 5000 to 6000 men, the Spaniards 3000, and the Imperialists 600; while the French army, which entered into the conflict 30,000 strong, could scarcely muster 20,000 after their victory.—Under the walls of S., Moreau, in 1794, defeated the Austrians.

SE'NEGA or SNAKE ROOT is the dried root of *Polygala Senega*. The following are its characters: 'A knobby root-stock, with a branched tap-root of about the thickness of a quill, twisted and keeled; bark, yellowish-brown, sweetish, afterwards pungent, causing salivation; interior, woody, tasteless, inert.' Senega is a powerful and trustworthy stimulating expectorant, and may be advantageously prescribed in the advanced stages of chronic bronchitis and pneumonia, especially when occurring in aged or very debilitated patients. It is also a valuable remedy in prolonged hooping-cough, and in the latter stages of croup and of bronchitis in young children. The preparations are the Infusion and the Tincture; the average dose of the former being an ounce and a half, of the latter a drachm. For children, the powdered root in doses of ten grains is the best form. See POLYGALA.

SENEGA'L (called by the natives *Senaga*), a large river in Western Africa, rises in Mount Cooro, in lat. 10° 30′ N., long. 10° 40′ W., flows first north-west and then west, and falls into the Atlantic after a course of 1000 miles, for the last 740 of which it is navigable for flat-bottomed boats. Here and there, throughout the whole course, the navigation is interrupted by cataracts, shoals, and rocks. In the lower course, the river forms numerous, large, cultivated, and very fertile islands, and its banks are green and productive, and in part clothed with wood. The entrance is difficult on account of breakers and a bar which, in the dry season, is covered by only 8 to 9 feet of water. It is navigable for some months by fair-sized steamers to Mediné (the furthest inland French station), 650 miles from the mouth. Thence the French were in 1883 making a railway to Bamakon on the Niger.

SENEGAMBIA, a large tract of country in Western Africa, lying between the Senegal and Sierra Leone. It is bounded by the Atlantic on the west, but has very indefinite limits towards the east. The country takes its name from its two principal rivers, the Senegal and the Gambia. Between these two rivers, which are 250 miles apart, there are no watercourses of any importance, and from the Gambia south to the frontier of Sierra Leone, the only considerable stream is the Rio Grande. The coast is deeply indented by arms of the sea, which resemble the estuaries of rivers. The country forms the western and northern declivity of the plateau of Kong, and part of is still unexplored. The soil is of two kinds, that of the coasts, and that of the interior: the former consisting in part of low flat alluvial plains, and partly of an undulating country, which broadens toward the north, until, on the northern frontier, it merges into the Sahara; while the plateau of the interior rises from the coast plains in mountainous terraces, until it loses itself in the Kong Mountains. Its loftiest elevations are only about 3280 feet high. S. is divided into three districts—High, Middle, and Low Senegambia. The first comprises the country to the north of the Senegal, and is inhabited by Moors, who, of course, profess Islamism. Middle S. comprises the countries bordering the Senegal, having an area of 1350 sq. m., and is inhabited by Negroes, who divide themselves into numerous tribes. Of this tract, the climate is extremely hot, and is unhealthy in the marshy districts. The soil is generally fertile, and yields the crops usually produced in the hot regions of Africa. Low S. comprises the countries bordering the Gambia, and extends south to Nunez. France possesses on the left bank of the Senegal (inland to Mediné), and along the coast to the Gambia, about 96,000 sq. m. of territory; the Portuguese, a small tract (30 sq. m.) on and around the estuary of the Rio Grande; and the English some little territory at the mouth of the Gambia (28 sq. m.).

SE'NESCHAL (Teuton. *sene-scalc*, senior servant?), in the origin of the office, probably an attendant of the servile class who had the superintendence of the household of the Frankish kings. In the course of time, however, the seneschalship rose to be a position of dignity, held no longer by persons of servile race, but by military commanders, who were also invested with judicial authority. The lieutenants of the great feudatories often took the title of seneschal. A similar office in England and Scotland was designed steward, but is rendered into Latin as *senescallus*.

SENIOR, NASSAU WILLIAM, political economist, born 1790, eldest son of Rev. J. R. Senior, vicar of Durnford, Wilts, was educated at Eton, and Magdalen College, Oxford, where he graduated in 1811, taking a distinguished first-class in classics. In 1819, he was called to the bar at Lincoln's Inn. In 1825, he was elected to the professorship of Political Economy at Oxford, founded by the late Henry Drummond, M.P. He held it for the statutory term of five years, and was succeeded by Mr. Whately, afterwards Archbishop of Dublin. In 1832, the enormous evils of the poor-law administration in England led to the appointment of a Commission of Inquiry. S. was one of the commissioners; and the portion of the Report in which the abuses of the existing system were detailed, was drawn up by him. This Report encouraged the Whig government to bring in the Poor-law Amendment Act of 1834. See POOR AND POOR LAWS. In 1836, he received the appointment of Master in Chancery; and in 1847, was re-elected to his former professorship for another term of five years.

More recently, he was nominated one of the commissioners of National Education, under the presidency of the late Duke of Newcastle. His publications, which are numerous, comprise various excellent treatises on political economy, some of which were delivered in the form of lectures at Oxford, and several pamphlets on social and political questions. He also contributed numerous articles to the *Edinburgh Review*, and other leading periodicals. He has left some interesting journals of his visits to

Turkey and Greece, and observations on the political and social condition of these countries. His *Essays on Fiction*, contributed to the chief reviews between the years 1821 and 1857, and republished in 1864, relate principally to the novels of Scott, Bulwer Lytton, and Thackeray. He analyzes the plots, and classifies the characters of the Waverley novels with curious felicity, and devotes a masterly essay to Thackeray, whom he regards as the greatest novelist of his day. The intellect of S. was clear and penetrating, and the perspicuity of his style made him an able expositor of the truths of political and social science. The *Treatise on Political Economy* was reprinted for the *Encyclopædia Metropolitana*. His *Conversations with distinguished Persons during the Second Empire*, a most interesting and valuable work, appeared in 1878. He died June 4, 1864.

SENLIS, a very ancient town of France, dep. of Oise, 33 miles north-north-east of Paris. Its older portion is surrounded by walls, flanked with 16 towers, which are all that remain out of the 28 towers of early times. The cathedral, a small edifice, is a beautiful example of early Gothic. Manufactures of cloth, lace, and thread are actively carried on. Pop. (1876) 6537.

SENNA is one of the most important purgatives contained in our Materia Medica. Two sorts of senna are recognized in the Pharmacopœia—viz., Alexandrian senna and Tinnevelly senna. The Alexandrian senna leaves are chiefly obtained from *Cassia lanceolata*, while the Tinnevelly senna leaves are yielded by *Cassia elongata*. *Alexandrian senna* is chiefly grown in Nubia and Upper Egypt, and is imported in large bales from Alexandria. It is apt to be adulterated largely with the flowers, pods, and leaves of *Cynanchum arghel* and *Tephrosia apollinea*. *Tinnevelly* or *East Indian senna* in odor and taste entirely resembles Alexandrian senna. The leaflets are, however, about two inches long, lanceolate, acute, unequally oblique at the base, flexible, entire, green, without any admixture.

Senna is, as Dr. Christison observes in his *Dispensatory*, 'so certain, so manageable, and so convenient a purgative, that few remedies of its class are held in equal estimation. In point of energy, it holds a middle place between the mild laxatives and drastic cathartics. It acts chiefly on the small intestines, increasing their mucous secretion, as well as their peristaltic motion, and producing loose brown evacuations.' The drawbacks to its more universal administration are its disagreeable taste, and its tendency to produce nausea, griping, and flatulence; the means of correcting which are subsequently noticed. The only circumstance positively contra-indicating its employment is an inflammatory state of the intestinal mucous membrane Although senna has been frequently submitted to chemical analysis, its active principle is not known; but whatever the cathartic principle may be, it is obviously absorbed into the circulation before it begins to operate, since this drug imparts a purgative property to the milk of nurses.

The following are the most important preparations of this medicine:

1. *Infusion of Senna*, which is obtained by infusing for one hour, and then straining, half an ounce of senna and half a drachm of sliced ginger in half a pint of boiling water. The taste of this infusion is much concealed by the addition of some black tea, or what Neligan finds 'still better, coffee, and it may be sweetened with sugar, and milk added; it is in this way readily taken by children.' The addition of neutral laxative salts checks the griping, which is often caused by senna alone, and at the same time increases its activity. The ordinary *Black Draught* is commonly prepared by adding one ounce of sulphate of magnesia to four ounces of infusion of senna. Two or three ounces of this mixture, to which a drachm each of the tinctures of senna and of cardamoms may be added, usually act as a very useful aperient.

2. *Tincture of Senna*, composed of senna, raisins, caraway seeds, and coriander seeds macerated in proof-spirit, and formerly known as *Elixir Salutis*, or *The Elixir of Health*, is seldom given alone. Christison recommends a mixture of an ounce of the tincture of senna with an ounce and a half of sulphate of magnesia, dissolved in four ounces of water, and as much infusion of roses. 'A wine-glassful of this given every hour seldom fails to act with energy, and without sickness or tormina, and is an excellent combination for most febrile disorders.' The tincture is, however, most commonly prescribed in doses of one or two drachms, as an adjunct to other cathartic mixtures, to correct their griping properties.

3. *Confection of Senna*, commonly known as *Lenitive Electuary*, is a pulpy mixture of powdered senna with powdered coriander seeds, figs, tamarinds, cassia pulp, prunes, extract of liquorice and sugar; all of which substances are, under certain specified conditions, combined by the action of boiling water. When properly prepared, which is often not the case, it forms a mild aperient, well suited for persons suffering from piles.

In the above preparations, it is immaterial whether Alexandrian or East Indian senna is employed.

The senna leaves of commerce and of medicine are the produce of several species of *Cassia* (q. v.), natives of India, Arabia, Syria, and the north of Africa. *Cassia obovata* is a perennial herbaceous plant 1—2 feet high, having smooth leaves, six or seven pair of obovate obtuse leaflets, racemes of yellow flowers, and curved, compressed pods, with an interrupted ridge along the middle of each valve. It is found in Egypt and Nubia, and is now also cultivated in Italy, Spain, the West Indies, &c.—*C. acutifolia* is a half shrubby plant, about two feet high, with racemes of yellow flowers, lanceolate acute leaves, and flat elliptical pods, somewhat swollen by the seeds. It grows in the deserts near Assouan, and the leaves are collected by the Arabs, and carried by merchants to Cairo for sale.—*C. elongata* is an annual with erect, smooth stem; narrow leaves, with 4—8 pair of lanceolate leaflets, which are rather downy beneath; racemes of yellow flowers; and oblong pods, quite straight, rounded at the apex, and tapering to the base. It grows in India.—*C. Æthiopica* is about 18 inches high, with 3—5 pair of oval-lanceolate, downy leaflets; the pods flat and smooth. It grows in the North of Africa.—*C. lanceolata* is an Arabian species, differing from the others in its erect pods.—All these seem to furnish the officinal senna.

Linnæus, not aware of the diversity of species, assigned it to one which he named *C. Senna*, but it would be hard to say which has a preferable claim to this name. All the species have the leaflets unequal-sided, by which they are readily distinguished from other leaflets often used for the adulteration of senna, as those of *Argel* (q. v.) and *Bladder Senna*. The commercial names of the different kinds of senna do not seem in general to correspond with differences of species, but rather to refer to the countries or ports from which they are brought.

BLADDER SENNA (*Colutea*) is a genus of shrubs of the natural order *Leguminosæ*, suborder *Papilionaceæ*, having pinnated leaves, red or yellow flowers, and remarkably inflated pods, whence the English name. One species (*C. arborescens*) is common in shrubberies in Britain. It is a native of the south of Europe, and is found on the ascent of the crater of Mount Vesuvius—almost the only plant that exists there.

SENNAA'R, lately a negro state, is now an Egyptian pashalik in the south of Nubia. The town from which it is named, *Sennaar*, near the Bahr-el-Azrek, and 160 miles S.S.E. of Khartoum, was once a most important city, but is still a trading center of some consequence. Pop. about 10,000.

SENNA'CHERIB, an Assyrian king, son of Sargon, reigned 702—680 B.C. The interest attaching to his name is principally due to the extraordinary and incomprehensible disaster that befell his army, either at Libnah or at Pelusium, when no fewer than 185,000 Assyrians are said to have been slain by the 'angel of the Lord' (see HEZEKIAH). The Egyptian account of this mysterious affair (reported by Herodotus, book ii. 141), and that of Berosus the Chaldæan, quoted by Josephus (*Antiq. of Jews*, book x. chap. 1), as well as the scriptural narrative (2 Kings, chap. 18) justify us in believing that S. at least sustained, a sudden, unexpected, and terrible overthrow, which forced him to retreat in hurried confusion to his own country. All that we know of his subsequent history is, that he was assassinated by his sons while worshiping his favorite god. The discrepancies, both as regards dates and names in the life of S., between the writer of Kings and profane historians, are felt even by strenuous apologists, like the Rev. George Rawlinson, to be almost, if not altogether irreconcilable. S. belongs to that showy class of eastern monarchs whose rule is commonly described as 'magnificent'—i. e., he built great palaces, and erected monuments in the different parts of his empire, and everywhere left an impression of his grandeur. In Scripture, in Herodotus, in Josephus, S. is the 'Great King.' His most imperial work was the palace at Koyunjik, which covered a space of more than eight acres, and was richly adorned with sculpture.

SENS, an old town of France, in the dep. of Yonne, 70 miles south-east of Paris, stands amid pleasing scenery on the right bank of the Yonne. The town proper is surrounded by walls, chiefly of Roman construction, and in the vicinity, the remains of ancient roads and of Roman camps abound. The spacious and handsome Gothic cathedral is the principal edifice. An active trade in wines, grain, hemp, wool, and timber is carried on. Pop. (1876) 12,251.

SENSA'TION (in Physiology) may be defined to be 'the perception by the mind of a change wrought in the body.' According to this definition, which is borrowed from Dr. Todd, sensation involves—first, a bodily change from some cause, whether inherent or external; and secondly, a mental change, whereby the perception of the bodily change is accomplished. The true organ of sensation is the brain, and especially that portion of it which (to use the words of the above-named eminent physiologist) constitutes the center of sensation, and extends into the spinal cord, forming the posterior horns of its gray matter. See SPINAL MARROW. Physiologists distinguish between *common* and *special*

sensation. Common sensation exists in the skin, and in all parts of the body to which ordinary sensory nerves are distributed, and is excited by ordinary mechanical or chemical stimuli; while special sensation is exemplified in the special senses of vision, hearing, &c. For the due action of the latter, there are organs of special sensation, which, by the peculiar character of the nerves with which they are supplied, become the recipients of impressions of a particular kind; thus, the eye is sensible to light, the ear to sound, &c.; and if the special nerves going to these organs be irritated, instead of pain being excited, as in the case of an ordinary sensory nerve, there is a feeling closely allied to that which would be excited by the application of the normal stimulus, as light, sound, &c. Any *ordinary* sensibility those organs (the eye, ear, &c.) possess is dependent on ordinary sensory nerves, and is quite independent of the nerves of special sense.

In works on the physiology of the nervous system, we often meet with the phrases *objective sensation*, *subjective sensation*, and *reflex sensation*. We shall conclude this article by a brief description of the meaning of these terms. 'In the ordinary mode of exciting sensations,' says Dr. Todd, 'the presence of an object is necessary. This object creates an impression on the peripheral parts of the sensitive nerves; and the change caused by this impression being duly propagated to the center of sensation, is perceived by the mind.' This, which is the ordinary form of sensation, is termed an *objective* sensation, in opposition to a so-called *subjective* sensation in which a mental act can develop a sensation independently of any present object. These subjective sensations are sometimes excited by the mind recalling, more or less exactly, the presence of an object; but in many cases they are caused by physical changes in the nerves themselves, owing to an excess or deficiency of blood, or some other pathological causes. Thus disordered conditions of the retina or optic nerve may give rise to motes or flashes of light; disturbance of the auditory nerve occasions singing in the ears, the sound of distant bells, &c.

To understand the mode in which *reflex* sensations are brought about, an acquaintance with *reflex action*, described in the article NERVES AND NERVOUS SYSTEM, is requisite. As examples of this form of sensation may be mentioned the facts, that the irritation of a calculus in the bladder will give rise to pain in the thighs; that diseased liver often excites pain in the shoulder-joint; and that ice or iced drinks suddenly introduced into the stomach, occasion intense pain in the forehead. For further information on the subject the reader is referred to Dr. Todd's article 'Sensation,' in the 4th vol. of his *Cyclopædia of Anatomy and Physiology*.

SENSATION, a name of great import in the Philosophy of Mind, as well as familiar in ordinary speech. In the mental process so named, there is a concurrence of many contrasting phenomena, rendering the word ambiguous, and occasioning verbal disputes.

1. In Sensation, there is a combination or concurrence of physical facts with a mental fact, and the name is apt to be employed in expressing either side. Thus, in sight, the physical processes are known to be—the action of light upon the globe and retina of the eye, a series of nerve-currents in the brain, and a certain outgoing influence to muscles and viscera; these are accompanied by the totally different phenomenon termed the feeling, or the mental consciousness of light. It is to the last fact, the mental fact, that the name Sensation is most correctly applied; but there is a natural liability to make it include those physical adjuncts which are inseparable from the mental manifestation.

2. In the still more comprehensive contrast of Mind and the External or Extended World, both members may be designated under Sensation. One and the same situation on our part may contain a strictly mental or *subjective* experience—pleasure or pain, for example—and an *objective* experience, or a recognition of the extended world, as distinct from mind. In looking at a fine prospect, both facts concur in fluctuating proportions; we have a feeling of pleasure (mind or subject) and a knowledge of the outspread or extended world (object), which is what affects us in the same way at all times, and affects all minds alike. As before, sensation is most properly used to express the strictly mental or subjective experience, the pleasure or the pain, while the 'Perception' should be applied to express the objective experience. See PERCEPTION.

3. In Sensation, a past experience recovered by memory is inextricably woven with the present impression, a circumstance which confuses the boundary-line between Sense and Intellect. The sensation that the full moon gives rise to is not solely owing to the present effect of the moon's rays on the organs of vision; the present effect revives or restores the total ingrained impression of the moon consequent on all the occasions when we have observed it. Again, it is impossible for us to have a sensation without a more or less complex feeling of difference or discrimination, which property is a fundamental fact of intellect. Our sensation of the moon supposes a contrast of the white light with the adjoining blue, of the round form with other forms, of the broad disc with a starry point, and so on. Thus, in Sensation we have a concurrence of all three processes of the intellect—Retentiveness, Agreement, and Difference. Sensation without Intellect is a mere abstraction; it is never realized in fact.

This last remark has important bearings upon the question as to the origin of our knowledge. It has been disputed whether or not our ideas are wholly derived from Sense. Now, seeing that there is no such thing as Sense to the exclusion of Intellect, the question ought to be enlarged and put in this form: Are our ideas wholly derived through Sense in conjunction with the intellectual processes, or are there any ideas that are not or cannot be so derived? When it is alleged, by Cudworth, Price, and others, by way of maintaining the doctrine of Innate Ideas, that Likeness, Unlikeness, Equality, Proportion, &c., are not obtained from sense, the answer is, that their origin may in all probability be accounted for by Sense co-operating with the well-known powers of the Intellect, and that, until the conjunction of the two is proved insufficient, the theory of an Intuitive origin is not called for.

SENSES. Referring for an account of the several senses to their respective designations, we will here endeavor to state what faculties or sensibilities of the mind are properly included under the name.

The common reckoning includes the Five Senses—Taste, Smell, Touch, Hearing, Sight—but this is not now considered exhaustive or complete.

For example, the feelings of Hunger, Thirst, Suffocation, Internal Warmth, and Chillness, &c., have all the characters implied in an ordinary sensation: they are the result of some External Agent acting on a distinct bodily organ, and giving rise to Feeling, sometimes pleasurable and sometimes painful. In order that these states, related to the sensibility of the different viscera, may find a place among the Senses, they have been grouped under one general head, and designated 'Sensations of Organic Life.' They are of great importance as regards our enjoyments and our sufferings, although not contributing much to our knowledge or intelligence. They approach nearest to Taste and Smell, the more emotional senses, and are at the furthest remove from the intellectual senses—Touch, Hearing, and Sight.

Again, the feelings connected with our Activity, or with the exercise of the muscular organs—as the pleasures of exercise and rest, the pains of fatigue, the sensibility to weight, resistance, &c.—were, until lately, overlooked in the philosophy of the mind. When they began to be recognized, it was common to treat them as a sixth sense, called the Muscular Sense. But this does not represent their true position. They do not arise from external agents operating on a sensitive part, but from internal impulses proceeding outwards to stimulate the muscular energies, and to bring about movements; they are thus the contrast of the senses generally. Sense is associated with the *ingoing* nerve-currents, Movement with the *outgoing*. The contrast is vital and fundamental; and accordingly, the Feelings of Movement and Muscular Strain should be considered as a genus distinct from the genus Sense, and not as a species of that genus.

The classification of the fundamental sensibilities of the mind would then stand thus: I. Feelings of Muscular Energy. II. Sensations of the Senses. 1. Organic Life; 2. Taste; 3. Smell—Emotional: 4. Touch; 5. Hearing; 6. Sight—Intellectual.

SENSIBI'LITY is a term somewhat vaguely used by physiologists. Until a comparatively recent period, it was often confounded with Irritability, although Haller more than a century ago, very clearly laid down the distinction between these two properties of tissues. We not unfrequently find it applied to nerves, to signify their power of evolving nervous force, but Excitability (as Dr. Todd observes) more exactly implies what is meant in this case. The term should be limited to signify the power which any part of the body possesses of causing changes, inherent or excited in it, to be perceived by the mind; and the greater this power is, the greater is the sensibility of the part. The degree of sensibility of different parts of the outer surface of body is very various. The relative sensibility has been ascertained by Weber by touching the surface with the points of a pair of compasses tipped with cork, and then (the subject's eyes being closed) by approximating the points until they were brought within the smallest distance at which they could be felt to be separate. The following are a few of his results: point of tongue, $\frac{1}{4}$ a line; tips of fingers, 1 line; red surface of lips, 2 lines; palmar surface of 2d phalanx, 2 lines; palmar surface of metacarpus, three lines; tip of the nose, 3 lines; palm of the hand, 5 lines; dorsum of the hand, 8 lines; vertex, 15 lines; skin over the spine and the middle of the thigh, each 30 lines; so that the sensibility of the skin is at least sixty times greater in some parts than in others.

SE'NSITIVE PLANT, a name commonly given to certain species of *Mimosa* (see MIMOSEÆ), on account of the peculiar

phenomena of Irritability (q. v.) which their leaves exhibit in their collapse when touched or shaken. Numerous species of *Mimosa* possess this property, and, indeed, most of the species in a greater or less degree; but those in which it is most conspicuous are humble herbaceous or half-shrubby plants. They have leaves beautifully divided, again and again pinnate, with a great number of small leaflets, of which the pairs close upwards when touched. On repeated or rougher touching, the leaflets of the neighboring *pinnæ* also close together, and all the pinnæ sink down, and at last the leaf-stalk itself sinks down, and the whole leaf hangs as if withered. If the stem is shaken, all the leaves exhibit the same phenomena. After a short time, the leaf-stalk rises, and the leaflets expand again. On account of this curious and interesting property, some of the sensitive plants are frequently cultivated in our hot-houses. They are generally treated as annuals, although capable of longer life. *M. sensitiva*, one of the best known species, is a native of Brazil, with prickly stems and leaf-stalks, and small heads of rose-colored flowers. *M. pudica* has a herbaceous stem, bristly, but not prickly. *M. casta*, *M. pudibunda*, *M. palpitans*, and *M. viva*, are also among the most sensitive species.

SENSO'RIUM. This term is applied by physiologists to a series of ganglionic centers, each of which has the power of communicating to the mind the impressions derived from the organ with which it is connected, and of exciting automatic or involuntary muscular movements in respondence to these sensations. (See Carpenter *On the Functions of the Nervous System in Human Physiology*, 6th ed. p. 545.) These ganglionic centers, which lie at the base of the brain in man, are in direct connection with the nerves of sensation, and appear to differ entirely in their functions from the other parts of the encephalon. Anterior, there are the *olfactive* ganglia, or what are termed the bulbs of the olfactive nerves. The ganglionic nature of these structures is more evident in many of the lower mammals, in whom the organ of smell is highly developed, than it is in man, although even in the human subject these masses contain gray or vesicular nervous matter, indicating their true ganglionic nature. Behind these, we have the *optic* ganglia, commonly known as the corpora quadrigemina, small in man, but comparatively large in many of the lower mammals. The *auditory* ganglia do not form distinct projecting masses, but are represented by small masses of vesicular matter, into which the auditory nerves may be traced, and which are imbedded in the medulla oblongata. In fishes, there is a well-developed and distinct auditory ganglion. The *gustatory* ganglion is the least distinct of any, but it is supposed to be represented by a mass of vesicular matter embedded, like the preceding ganglion, in the medulla oblongata, and into which the nerves of taste may be traced. On examining a progressive series of brains from man to the lowest mammals, we find a continuous diminution of the hemispheres, and a corresponding development of these ganglia, or, at all events, of the olfactory and optic ganglia; while, if we continue the investigation to the brains of birds, reptiles, and fishes, we find the same law in force, till finally, in reptiles and fishes, those ganglia form the greatest part of the brain.

It was long attempted to determine some one point in the brain where the soul is more especially located or centralized; and to this ideal point the name of Sensorium was applied in the older psychological speculations. The fancy of Descartes made it a small body near the base of the brain, called the 'pineal gland.' The recent views of the nervous system repudiate the idea of a central point of this nature; in consciousness, the brain generally is active, although, under different impressions and ideas, the currents may be presumed to follow different nerve-tracks. Consequently, no meaning is now attached to a sensorium in psychology, as distinct from the cerebrum at large.

SENTENCE. A sentence is the form of words in which a thought or a Proposition (q. v.) is expressed. A mere phrase or group of words, such as, 'A very high mountain,' which only conveys meaning or calls up an idea, but does not make an affirmation, is not a sentence. Since speech is the expression of thought, the sentence is the proper unit or integer of speech, and thus forms the starting-point in the study of language.

Every single sentence is made up of two parts—the one naming the subject, or the something that is spoken about; the other the predicate, or the something that is said of it—as, 'The sun—shines;' 'Those who have the greatest gifts, and are of the greatest usefulness—are the most humble.' Every sentence must contain a finite verb, as it is the function of the Verb (q. v.) to make affirmations. 'The sun shines,' is an example of a sentence in its barest form, containing merely the subject 'sun,' and the predicate 'shines,' which are called the *principal* elements. The enlargement or development of the sentence takes place by means of adjuncts, or *secondary* elements, tacked on to the principal elements—as, '*Young* birds build *nests without experience*.' Sentences may be divided into simple, compound, and complex.

1. A simple sentence has only one subject and one finite verb. Reduced to its essentials, it is of the form, 'The sun shines;' 'The day is cold.' 2. A compound sentence consists of two or more simple sentences combined—as, 'The sun gives light by day, and the moon by night;' which contains two affirmations or sentences, 'The sun gives light by day,' and 'The moon gives light by night.' 3. A complex sentence consists of one principal sentence together with one or more dependent sentences. In the compound sentence given above, there are two distinct statements, and as both are put on the same footing, they are said to be *co-ordinate* sentences. But when we say, 'The moon rose as the sun went down,' the going down of the sun is not mentioned on its own account; the only thing directly affirmed is that the moon rose at a certain time, and the going down of the sun is only introduced as marking that time. Such clauses are called *subordinate* sentences (see CONJUNCTIONS). The subordinate clauses of complex sentences may be considered as transformations of the elements of the simple sentence; and according to the nature of the element which has been transformed, they might be called noun-sentences, adjective-sentences, or adverbial sentences—e. g., '*The existence of God* is denied by none' = '*That God exists*, is denied by none.' '*Benevolent* men are happy' = 'Men *who seek the good of others* are happy.' 'The moon rose *at sunset*' = 'The moon rose *as the sun went down*.' Further, the nouns, adjectives, and adverbs that enter into a subordinate sentence, may, one and all of them, be transformed in their turn into sentences, which will thus be subordinate in a still higher degree—e. g., 'Europe rejoiced *that Greece was delivered from that oppressive power*' = 'Europe rejoiced *that Greece was delivered from the power that had oppressed her*.' Here the adjective *oppressive* in the first sentence has in the second been converted into a sentence which is directly dependent, not on the principal sentence (Europe rejoiced), but on the subordinate, and is therefore subordinate in the second degree. Subordination is seldom carried beyond the second or third degree, as it becomes perplexing, and weakens the force of the principal assertion. The same sentence is often compound, as containing two or more co-ordinate sentences, and at the same time complex, as containing one or more subordinate sentences in addition; and to discriminate all these and point out their relations, is to give the syntactical analysis of the sentence.

SE'NTINEL, SENTRY (from the Lat. *sentire*, to feel or perceive, through the Ital. *sentinella*), a private soldier, marine, or sailor, posted at a point of trust, with the duty of watching the approach of an enemy, or any person suspected of hostile intentions. Sentries mount guard over dépôts of arms, the tents of commanding officers, &c. During the night, each sentry is intrusted with the 'word,' or countersign; and no person, however exalted in position, may attempt to approach or pass him without giving that as a signal. In such case, the sentry is bound to arrest the intruder, and, if necessary, to shoot him. It has happened before now that the commander-in-chief of an army has been prisoner in the hands of one of his own sentries. When an army is in the field, the sentries, are its eyes, for they guard the approaches in every direction some distance in front of the main body of troops. In the event of attack, they give the alarm, and retire slowly on their supports. There is usually an agreement, tacit or expressed, between commanders that their outlying sentries shall not fire upon one another, which would only be productive of useless bloodshed. Under martial law, death is the penalty to a sentry for sleeping on guard.

SE'NZA SORDI'NO (Ital. without the mute, or without the damper), a musical term, which, when applied to the violin or violoncello, denotes, that the Mute (q. v.) is to be removed. In pianoforte music, it means that the performer must press down the pedal which takes off the dampers.

SEPAL. See CALYX.

SEPARATE ESTATE is the legal term denoting the property of a married women, which she holds independently of her husband's interference and control. Where a marriage is about to be entered into, and the lady has property, it is usual, before the marriage, for her to assign and convey to trustees all or part of her property, so that it may continue to be vested in them for her exclusive benefit, and so that she may be able to deal with it in much the same manner as if she were not married. The deed in that case entirely regulates the extent of her rights. Where the deed has been properly executed, she can draw the interest, and do what she pleases with it. A third party who bequeaths property to a married woman, may also so give it as to make it separate estate. If there is no clause in the deed or will prohibiting alienation or anticipation, she will be able to dispose of her life-interest. She can, in general, alienate her separate estate without the husband's consent; and she is not bound out of it to maintain the husband, even though he may be destitute; nor is she bound to maintain her children, unless the latter would otherwise be chargeable to the parish. When a wife incurs debts and liabilities, her separate estate will become chargeable with these, unless she was at the time acting only as the agent of the husband.

such as ordering necessaries for the house. In Scotland, a wife is bound out of her separate estate to maintain a destitute husband, and the husband's consent is necessary to her alienation of the separate estate.

SEPARATION of married persons is either judicial or voluntary. If the parties enter into a deed, or other arrangement, to live separate, this is called a voluntary separation, and, in general, the legal rights of the parties are not altered, except that if the wife is provided with maintenance, she has no longer an implied authority to bind the husband. And though voluntary separation is not encouraged by courts of law, yet effect will be given frequently to deliberate contracts of this kind entered into between the parties. See JUDICIAL SEPARATION.

SE'PARATISTS. See QUAKERS, OATH.

SE'PIA AND SEPI'ADÆ. See CUTTLE-FISH.

SEPIA, a pigment used as a water-color. It is prepared from the secretion of a peculiar organ, called the ink-bag, found in the Dibranchiate *Cephalopoda*, or Cuttle-fishes. This secretion is black at first, and insoluble in water, but extremely diffusible through it; it is therefore agitated in water to wash it, and then allowed slowly to subside, after which the water is poured off, and the sediment, when dry enough, is formed into cakes or sticks. In this state it is called 'India Ink.' If, however, it is dissolved in a solution of caustic potash, it becomes brown, and is then boiled and filtered, after which the alkali is neutralized with an acid, and the brown pigment is precipitated and dried: this constitutes the proper sepia. It is usually prepared in Italy, great numbers of the species which yields it most abundantly, *Sepia officinalis*, being found in the Mediterranean. The black kind, called India Ink, is prepared in China, Japan, and India, and forms the common writing-ink of those countries.

SE'POY, corrupted from the Indian word *sipahi*, a soldier. This word sipahi, in its most familiar form of *spahis*, is known in most eastern armies; and is itself derived from *sip*, a bow and arrow, the ordinary armament of an Indian soldier in ancient times. The word sepoy now denotes a native Hindu soldier in the British army in India. See EAST INDIA ARMY. The present sepoy force numbers about 140,000.

SEPS. See SCINK.

SEPTA'RIA are ovate flattened nodules of argillaceous limestone, internally divided into numerous angular fragments by reticulating fissures radiating from the center to the circumference, which are filled with some mineral substance, as carbonate of lime or sulphate of barytes, that has been infiltrated subsequent to their formation. The fissures have been produced by the cracking of the nodule when drying. They are largest and most numerous in the center, and gradually decrease outwards, showing that the external crust had first become indurated, and so, preventing any alteration in the size of the whole mass, produced wider rents as the interior contracted. The radiating figure, and the striking contrast between the dark body of argillaceous limestone and the more or less transparent sparry veins, when the nodule is cut and polished, has caused them to be manufactured into small tables and similar objects. They are, however, most extensively employed in the manufacture of cement. As they are composed of clay, lime, and iron, they form a cement which hardens under water, and which is known commercially as Roman cement, because of its properties being the same as a famous hydraulic cement made of ferruginous volcanic ash brought from Rome. Septaria occur in layers in clay deposits, and are quarried for economical purposes in the clays of the London basin. Large numbers are also dredged up off Harwich, which have been washed out of the shore-cliffs by the waves. The nodules generally contain a scale, shell, plant, fruit, coprolite, or some other organic substance, forming the nucleus that has apparently excited the metamorphic action which withdrew from the surrounding clay the calcareous and ferruginous materials scattered through it, and aggregated them around itself.

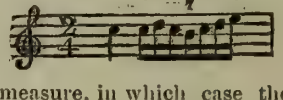
SEPTE'MBER (Lat. *septem*, seven) was the 7th month of the Roman calendar, but is the 9th according to our reckoning, though we preserve the original name. Various Roman emperors, following the example of Augustus, who changed 'Sextilis,' the sixth month of the Roman calendar, into 'Augustus' (August), attempted to substitute other names for this month, but the ancient appellation continued to hold its ground. The Saxons called it *gerst-monath*, or barley-month, because barley, their chief cereal crop, was generally harvested during this month. It has always contained 30 days.

SEPTE'MBRISTS, SEPTEMBRI'SERS (Fr. *Septembriseurs*) the name given to the frantic executioners in what are known as the 'September massacres' in Paris. The particular causes of this ferocious outburst were twofold—mad fear of domestic traitors and of foreign despots. The news came pouring into Paris, ever more and more maddening, of Prussian and Austrian hordes marching victorious over the frontiers; insolent royalists obtruding themselves in the van of the invading armies, and breathing threatenings and slaughter; while numerous *aristocrates* (i. e., favorers of the king and court) were believed to be making preparations to receive them in Paris. At the very same moment broke out the royalist insurrection in *La Vendée*, rendering France still further delirious, whereupon Danton, 'minister of justice,' got a decree passed, August 28. 1792, ordering domiciliary visits for the arrest of all suspected persons, and for the seizure of arms of which patriotic France stood much in need. Upwards of 2000 stand of arms were got in this way, and 400 head of new prisoners.

On the morning of September 2, the news of the capture of Verdun by the Prussians arrived. The mingled rage and panic of the people cannot be described. All the bells in Paris were set a-clanging; men and women hurried in myriads to the *Champ de Mars* to get themselves enrolled as volunteers. Danton entered the legislature—'the black brows clouded, the colossus-figure tramping heavy, grim energy looking from all features of the rugged man'—and made that famous speech, ending: 'Pour les vaincre, pour les atterrer, que faut-il? De l'audace, encore de l'audace, et toujours de l'audace.' The effect was electrical. He obtained from the Assembly a decree condemning to death all 'who refused to march to the frontiers or to take up arms.' But patriotism against foreigners was not enough. Were not the traitors at home deserving of death? Marat thought so: multitudes of ardent frantic men and women shared his conviction; but it is not proved that either Marat or Danton formally ordered the massacres, or, indeed, that anybody ordered them. They were rather the spontaneous outburst of patriotic insanity, beholding aristocratic treachery and plots everywhere. Priests, Swiss soldiers, aged and infirm paupers, women both reputable and disreputable, and criminals, were mercilessly cut down or shot. From Sunday afternoon till Thursday evening the wild butchery went on at the Bicêtre, the Abbaye, the Convent of the Carmelites, the Conciergerie du Palais, the Grand Châtelet, St. Firmin, La Force, and the Salpétrière. One gathers a glimpse of the savage sincerity of the Septembriseurs when one reads that the gold rings, watches, money, &c., found on the persons of the massacred were all religiously brought to the town-hall; not a single thing was stolen or furtively appropriated until after the essential work was done. Then the roughs or blackguards ('sons of darkness,' as Carlyle calls them) sallied out into the streets like Mohawks or Alsatians, and commenced to plunder, but were speedily suppressed and forced back into their dens.

Great misapprehension prevails as to the numbers who perished in these fearful scenes. Royalist pamphleteers and others, trusting mainly to fantasy (according to Carlyle, *Fr. Rev.* vol. ii. p. 158), reckon the victims at 3000, 6000, and even 12,000; but the accurate advocate Maton (who was in the thick of the horrors, and narrowly escaped the guillotine) reduces the number by 'arithmetical ciphers and lists,' to 1089, which, be it observed, included numbers of forgers of assignats, and other criminals. It was a sad and horrible affair, as all massacres are; but it is above all things desirable to know exactly the *dimensions* of, and the motives that stirred the actors in, so execrable a tragedy.

SEPTIMOLE, in Music. When a note is divided into seven instead of four parts—for example, a minim into seven quavers, or a crotchet into seven semiquavers—the group is called a septimole, and the figure 7 is generally placed over it.



A septimole may also occur in a $\frac{6}{8}$ measure, in which case the seven notes are collectively of the value, not of four, but of six.

SEPTUAGE'SIMA SUNDAY (Lat. *Septuagesima*, 'the seventieth'), the third Sunday before *Lent* (q. v.), so called, like 'Sexagesima' and 'Quinquagesima,' from its distance (reckoned in round numbers) before Easter.

SE'PTUAGINT (Gr. *Hoi ton O*, or *hoi O*; Lat. *Septuaginta*; Seventy, LXX., Alexandrine version, &c.), the most ancient Greek translation of the Old Testament that has come down to us, and the one commonly in use among the Jews at the time of Christ. Its origin is shrouded in deep obscurity. The principal myth about it—repeated by Philo, Josephus, the Talmud, and the Church Fathers (Justin, Clement of Alexandria, Epiphanius, and the rest), with individual variations—is contained in a letter purporting to be written by a Greek, Aristeas, to his brother, Philokrates, during the reign of Ptolemy Philadelphus (284—247 B.C.). This king, it is stated, anxious to embody in a collection of laws of all nations on which he was engaged, also those of the Jews, invited, by the advice of his librarian, Demetrius Phalereus, 72 men of learning and eminence from Palestine, who performed the task of translation (on the isle of Pharos) in 72 days. The facts upon which this legend—utterly rejected now as a piece of his-

tory—rests, cannot well be ascertained now. So much, however, seems clear from another anterior testimony (Aristobulos), that Ptolemy, aided by Demetrius, did cause a Greek version of the Pentateuch to be executed, probably during the time of his being co-regent of Ptolemy Lagi. That the translator or translators, however, were not Palestinian but Egyptian Jews, appears equally clear both from the state of the text from which the translation must have been made, and from the intimate acquaintance with Egyptian manners and customs which it evinces. This text differs, especially in the Pentateuch, considerably from our received text, but agrees in many instances with the Samaritan (q. v.). The question of the number of translators has been much and warmly discussed, but with little positive result. So much only seems certain, that different hands were employed in the rendering of the different parts of the Pentateuch, upon which infinite care was bestowed, as well as of the other books of the Old Testament, which, indeed, do not seem to have been done at the same time.

In some instances, it would appear as if the translation had been made before the non-pentateuchial books were united with the others into one canon. This seems particularly evident in the case of the book of Jeremiah, which in the translation, appears in a more primitive form than in the state in which we possess it now. In a less degree does this discrepancy appear in Job, the Proverbs, Daniel, and Esther; of these, however, our canon probably contains the original form, while the LXX. shows later variants. It is, however, in neither of these books to be decided now whether the discrepancies observable are due to an already altered text upon which the translators worked, or whether they were their own emendations; or even whether many of them are not due to a much later period. The translation of the book of Daniel is the most flagrant instance of subsequently introduced 'corrections' and additions. Apart from the apocryphal pieces attached to it, its obscure passages were 'emendated' to such an extent by both Jews and Christians, that it was by the authority of the early Church utterly rejected, and replaced by the version of Theodotion. The translator of Job, though less arbitrary, has yet altered, added to, and abbreviated considerably, hie text. Esther has many apocryphal additions, which owe their origin probably to the Alexandrine period, and never existed in Hebrew. Of exaggerated literalness is the version of Ecclesiastes and the Psalms. Among the most successful books are to be mentioned the Psalms and Ezekiel. But, on the whole, there is to be noticed throughout, a lack of an exact knowledge of the original, a striving after minute fidelity in one part, and an unbridled arbitrariness in another; further, a desire to tone down or to utterly eliminate anthropomorphisms or anything that appeared objectionable to the refined taste of the time.

The Septuagint was held in the very highest repute among the Alexandrine Jews, while the Palestinians looked upon it as a dangerous innovation, and even instituted the day of its completion as a day of mourning. Gradually, however, it also found its way into Palestine, and at the time of the composition of the New Testament, it seems almost to have superseded the original, considering that its quotations from the Old Testament are almost invariably given from the LXX. It was read and interpreted in the synagogues for some centuries after Christ, until the increasing knowledge of the original, fostered by the many academies and schools, and the frequent disputations with the early Christians, brought other and more faithful and literal translations, such as that of Aquila, Theodotion, &c., into use, and gradually the LXX. was altogether discarded in the synagogue. The Church, however, for a long time, and the Greek Church up to this day, considered it as of equal authority and inspiration with the Hebrew text itself; and many translations were made from it into the vernaculars of different Christian communities (the Itala, the Syriac, the Ethiopian, Egyptian, Armenian, Georgian, Slavonian, &c.). The large diffusion of the LXX. among the Hellenists and the churches, and the want of anything like a critically fixed text, together with the pious desire bodily to insert the peculiar explanation given to obscure passages by single authorities, the ignorance of the copyists, and a number of other causes, contributed not a little to render the MSS. corrupt, in some instances past mending. Nor were the endeavors of Origen (q. v.) in his *Hexapla*, or of Lucianus and Hesychius for a restoration of the proper text, of any avail.

The principal MSS. that have, as far as we know, survived are the Codex Alexandrinus in the British Museum, the Codex Vaticanus in Rome, and the Sinaitic Codex (imperfect) in St. Petersburg; all of which belong to the time between the 4th and 6th centuries A.D. The principal editions are the Complutensian (1514—1517), reprinted in the Antwerp and Paris Polyglot; the Aldine of Venice (1518); the Sixtine of Rome (1587), partly reprinted in Walton's Polyglot (1657) by Lamb Bos. (Franeker, 1709); Reineccius (Leip. 1730); Parsons and Holmes (Oxford, 1798—1827); Tischendorf (1850, &c.). Following more closely the Codex Alexandrinus is the edition of Grabe (Oxford, 1707—1720. completed by F. Lee), reprinted by Breitinger (Zürich, 1730—1732) and others. The Alexandrine Codex has been reproduced in facsimile by H. H. Baber; the Sinaitic in the same manner by Tischendorf. Some other MS. recensions are mentioned by the early Fathers, such as the 'Hebrew,' the 'Syrian,' the 'Samaritan,' the 'Hellenian,' &c. The literature of the LXX. is very large, and special grammars and dictionaries have been compiled for its peculiarly corrupt idiom.

SEPU'LCHRAL MOUND. The practice of rearing mounds of earth and stone over the resting-place of the dead may be traced to remote antiquity. It had doubtless its origin in the heap of earth displaced by interment, which, in the case of the illustrious warrior or chief, it became the practice to raise into the size and form of the barrow or tumulus which is found all over Northern Europe, from Great Britain and Ireland to Upsala in Sweden, and the Steppes of Ukraine. Sepulchral mounds of some sort seem, indeed, to have been erected among all the nations of Asia as well as of Europe, and they are found in numbers in Central America. Some of the larger tumuli or moathills are but partially artificial; natural mounds having been added to or shaped into the form which it was wished that they should take.

There is considerable diversity in the form of the tumuli, the different forms corresponding to different periods, considerably remote from each other. The oldest are long-shaped, and in the form of gigantic graves, often depressed in the center, and elevated towards one end. Inside the tumulus, the body was laid at full length, often along with spear and arrow heads of flint and bone. The bell and bowl-shaped tumuli seem to have succeeded this early form. Within them is often found a short cist and primitive cinerary urn, showing that the body had been burned; but there appears also to be evidence that the processes of inhumation and cremation had been in use contemporaneously, or sometimes the body was placed within the cist in a sitting posture. Skeletons of dogs and horses are occasionally found beside the ashes of the deceased. The sepulchral mounds which seem to be of latest date are broad and low, surrounded sometimes by an earthen vallum, and sometimes, particularly in Scotland and Scandinavia, by a circle of standing stones. In both the enclosed and encircled tumuli, weapons have been found belonging to the period when the metallurgic arts were practiced, and in some instances Roman as well as native relics. A remarkable form of tumulus frequent in Sweden, and occasionally seen in Scotland, consists of an oblong mound larger than the primitive barrow, and terminated at both ends in a point, whence it has been called the *skibs ælunger*, or ship-barrow. Scandinavian antiquaries have come to the conclusion that the bodies of the warriors of the deep were sometimes burned in their ships, whose form was repeated in the earthwork reared above their ashes.

The most numerous class of sepulchral mounds in Scotland are the *cairns* (q. v.) or tumuli of stone, which abound in every district of the country, and were often of much larger dimensions than the earthen tumuli. Another species of monument is the *cromlech* (q. v.).

SEPULVEDA, JUAN GINES DE, a Spanish historian, surnamed the Livy of Spain, was born at Pozo-blanco, in the neighborhood of Cordova, about 1490, studied first at Cordova and Alcala, and went to Bologna in 1515, where he obtained the acquaintance and esteem of the most celebrated savans of Italy and Spain. There he wrote the life of Cardinal Albornoz, which was published in 1521. He assisted Cardinal Cajetan at Naples in revising the Greek text of the New Testament, and in 1536 returned to Spain as chaplain and historiographer to Charles V., and preceptor to his son, afterwards Philip II. Died in 1573 or 1574. Erasmus speaks of S. in the *Ciceronianus* in terms of high encomium, and there is indeed little doubt that he was one of the most learned men and best writers of his time. His works comprise Latin translations of part of Aristotle (1531), and of the commentary of Alexander Aphrodisiensis (1527); miscelaneous dissertations, among which were treatises on Fate and Free-will, in opposition to Luther (1526), in favor of a war with the Turks (1529), in defence of Alberto Pio Cardinal Carpi (1531), on Marriage (1531), and in support of the congruency of the military profession with Christianity (1541), on Monarchy and the Duty of Kings (1571). His histories of the Reign of Charles V., of that of Philip II., and of the Conquests of the Spaniards in Mexico, all of them written in Latin, are still inedited. His other works were collected and published by the Royal Academy of History at Madrid in 1780 (4 vols. fol.), accompanied with a portrait of S., and an account of his life and writings.

SEQUESTRA'TION, the Scotch legal term for Bankruptcy (q. v.).—In English law, sequestration is the appropriate term denoting the process by which the creditor of a clergyman of the Church of England in possession of a living, sues out execution on his judgment, and obtains payment of the debt. In ordinary cases of lay debtors, the sheriff takes possession of the real estate of

judgment debtors; but when the debtor is a clergyman, the bishop puts in force the law, and appoints sequestrators to take possession of the benefice, and draw the emoluments, and pay them over to the creditor, first making due provision for the proper celebration of divine worship.

SE'QUIN (Ital. *zecchino*, from *zecca*, the name of the Venetian mint), a gold coin first struck at Venice about the end of the 13th c., was about the size of a Ducat (q. v.), and was equivalent to about 9*s*. 4*d*. sterling. Coins of the same name, but varying in value, were issued by other states.

SERA'GLIO (properly, SERAI) is the palace of the sultan at Constantinople. It stands in a beautiful situation on a head of land projecting into the sea, known as the Golden Horn, and is enclosed by walls 7½ miles in circuit. Within the walls are a variety of mosques, gardens, and large edifices, capable of containing 20,000 persons, though the whole number of the inhabitants scarcely ever reaches the half of this. The principal entrance (*Babi Humayun*, or Sublime Gate) is a kind of pavilion, which is constantly guarded by *capidjis*, or officers of the seraglio; and the chief of the large edifices within is the *harem* (Arab. sacred spot), which is distinctly separated from the rest of the seraglio, and consists of a group of houses and gardens, one of each being possessed by each of the sultan's wives, and of the habitations of the concubines and slaves.

The harem is ruled by the *kiaja-khatun*, or inspector of the women, who is under the sultan's authority alone, and is supplied with what they require by the *kislar-aga*, or chief of the black eunuchs who form the principal or inner guard of the harem. The second and outer guard is given to the white eunuchs, under their chief the *kapu-agassy*, or *kapu-oghlan*. Other classes of household officers are the *mutes* (Turkish, *bisebân* or *dilssis*), who, till recently, were the executors of the sultan's orders, especially those in which the utmost secrecy was required; the *bostanjis*, or gardeners; the *baltajis*, or cleavers of wood; and the *itsh-oghlans*, or attendants of the sultan. The sultan's mother always resides within the seraglio, but his sisters do not. Access may easily be had to the seraglio, with the exception of the harem, which is scrupulously guarded from even the eyes of strangers. The English have improperly confounded the two terms 'seraglio' and 'harem.'

SERAI'NG, a town of Belgium, in the province of Liege, and between three and four miles south-west from Liege, on the right bank of the Meuse. It is a station on the railway between Namur and Liege, and is connected by a handsome suspension bridge with the village of Jemeppe, on the left bank of the Meuse. S. is a place of great activity, and contains a manufactory of steam-machinery, locomotives, &c., which is probably the largest in the world. This manufactory was established by an Englishman, John Cockerill, in 1816; the king of Holland, to whose dominions Belgium then belonged, joining him in the enterprise. After the revolution of 1830, Cockerill bought up the shares belonging to the king of Holland, and the works became entirely his own. On his death in 1840, a company was formed, called *La John Cockerill Société*, to which they now belong. They occupy the former palace of the Prince-bishops of Liege, which still forms their front, the extensive gardens behind it having been covered with buildings, where all the processes of machine-making are carried on. Forty or fifty tall chimneys are clustered on this spot. The town depends on these works for its prosperity. Pop. (1870) 22.000; (1876) 24,315.

SERA'JO. See BOSNA-SERAI.

SERAMPO'RE, a neat town of British India, built in the European style, and extending a mile along the right bank of the Hooghly, 14 miles north of Calcutta. Paper is here manufactured in large quantity. S. was at one time a Danish settlement, but was transferred by purchase to the British in 1845. Pop. (1871) 24,440.

SERANG. See CERAM.

SERA'PEUM (Gr. *Serapeion* or *Sarapeion*), a temple so named in honor of Serapis (q. v.), several of which are known to have existed in the ancient world. The most remarkable of these temples was that of Alexandria, which was situated south of the canal, and outside the walls of the city, and superseded an older temple at Rhacotis. Hither was transported the statue of Dis or Pluto from Sinope by Ptolemy I., and attached to it was the celebrated Alexandrian Library (q. v.). The S. at Memphis attained scarcely less reputation, and consisted of a group of temples dedicated to Astarte, Anubis, Imouthos or Æsculapius, and Serapis. It was approached from the city of Memphis by an avenue of sphinxes, which had already become partially buried in the sands in the days of Strabo, and were discovered by M. Mariette in 1850, who after a series of excavations, uncovered the ruins, and discovered the cemeteries of the mummied Apis or Bulls sacred to Ptah and Osiris at Memphis. Close to the S. was the Apeum, or temple of the living Apis, in which the bull lived, as well as the cow which had produced him. The S., or, as it was called in Egyptian, the abode of *Osor-hapi*, or the Osiris-Apis, was, in fact, the sepulchre of the bull.

The most remarkable part of the work, which was of great extent, was the subterranean tombs of the mummies of the Apis, consisting of galleries with numerous chambers, in which the remains of these bulls had been deposited from the reign of Amenophis III. of the 18th dynasty, about 1400 B.C., till the time of the Romans. Two principal galleries contained the tombs. The second gallery, commenced in the 53d year of Psammetichus I., was on a grander scale than the first, with larger sepulchral chambers, and magnificent sarcophagi of granite, measuring sometimes 12 feet high, 15 feet long, and weighing many tons. During the reign of the Persians, and subsequently, the chambers decreased in size, and the monuments exhibit the general decadence of the arts. The Apis, considered as the incarnation of the god Ptah during life, received royal and divine honors after death; his body, or the principal portion, being embalmed, and a sepulchral tablet or tombstone placed on his sepulchre, along with other tablets of different worshipers, who adored his divinity, and dedicated them to the deceased bull. As the principal tombstone of the bull contained the dates of the king's reign in which he was born or discovered, enthroned in the Apeum, and died or was buried in the S., these tablets have become an important element for the chronolgy of the 19th and subsequent dynasties, and have aided to fix some of the hitherto doubtful points of the chronology of the period. They terminate with Ptolemy Euergetes II., 177 B.C. The tablets, votive and sepulchral, amounted to about 1200, and the most remarkable are at present in the Museum of the Louvre at Paris.

Numerous bronze figures and other antiquities were found during the excavations, comprising costly objects of jewelry, many of which are also in the Louvre. Besides these, several Greek papyri which appear to have formerly belonged to the library or archives of the S. were previously known, and many have been published. These throw great light upon the constitution of the hierarchy of the S. amongst which was a kind of order of monks, who lived within the precincts of the building, beyond which they did not go, and subsisted upon alms or the contributions of their family.—Mariette, *Serapeum de Memphis* (4to, Paris, 1856); *La Mère d'Apis* (4to, Paris, 1856); *Athen. Fran.* (4to, Paris 1855—1856); Lepsius, *Ueber den Apis-kreis, Zeitsch. d. Morg. Gesell.* (8vo, Leip. 1853).

SE'RAPHIM (plural of *Seraph*), celestial beings in attendance upon Jehovah, mentioned by Isaiah. They are similar to the Cherubim (q. v.), have the human form—face, voice, two hands, and two feet—but six wings, with four of which they cover their face and feet—as a sign of reverence—while with two they fly. Nothing is more uncertain than the origin of this conception, or of the word which expresses it. Their office of singing the praises of Jehovah's greatness, and of being the swift messengers between heaven and earth, does not go far to explain it. Deserving of consideration, however, considering the close contact between Judæa and Assyria and Babylon, both before and after the Captivity, is a comparison between the S. and the winged men and beasts that have been brought to light in these last-named countries.

SE'RAPHINE, a keyed musical instrument in which the sounds were produced by the action of wind on free vibratory reeds. It was the precursor of the harmonium (q. v.).

SERA'PIS, or SARAPIS, the Greek name of an Egyptian deity, introduced into Egypt in the time of Ptolemy I., or Soter. This monarch is said to have seen the image of a god in a dream commanding him to remove it from the place where it was; and Sosibius, a traveler, having recognized it as existing at Sinope, Soteles and Dionysius were sent from Egypt, and brought it from Sinope to Alexandria. On its arrival, it was examined by Timotheus the interpreter and the celebrated Manetho, who called it Serapis, and appear to have identified it with Osorhapis, or Osiris united with Apis, i. e., Osiris, in his character of the Egyptian Pluto, as a deity of similar character. The figure, in fact, appears to have been one of Hades or Pluto, having at its side Cerberus, and a dragon or snake. According to some authorities, the statue of S. was sent to Ptolemy II., or Philadelphus, because that monarch had relieved the city of Sinope from famine by supplying it with corn, and the statue was placed in the Serapeum, at the promontory of Rhacotis. The S. of the Ptolemaic period, however, was not an Egyptian, but a Greek deity, whose temple was not admitted into the precincts of Egyptian cities, and only found favor in the Greek cities founded in Egypt. It is said that 42 temples were erected under the Ptolemies and Romans to this god in Egypt. His resemblance to Osiris consisted in his chthonic or infernal character, as judge of the dead and ruler of Hades. About his nature and attributes the Greeks themselves entertained very different ideas, some considering him allied to the Sun, others to Æscula-

Serapis.
From a Seal in the British Museum.

pius or Hades. The god had a magnificent temple at Alexandria, to which was attached the celebrated Library; another at Memphis, in the vicinity of the cemetery of the mummies of the Apis, which has been recently excavated by M. Mariette; and another temple at Canopus.

From recent discoveries, it appears that he represented or was identified with the Hesiri Api, or Osorapis, the 'Osirified' or 'dead Apis,' who was also invested with many of the attributes of Osiris, and considered, while living, to be the incarnation of the god Ptah-Socharis-Osiris, the tutelary divinity of Memphis. The worship of S., introduced into Egypt by the Ptolemies, subsequently became greatly extended in Asia Minor; and his image, in alliance with that of Isis and other deities, appears on many of the coins of the imperial days of Rome. In 146 A.D, the worship of the god was introduced into the city of Rome by Antoninus Pius, and the mysteries celebrated on the 6th May; but they were not long after abolished by the senate, on account of their licentious character. A celebrated temple of S. also existed at Puteoli (Pozzuoli), near Naples, and the remains of it are still seen, and present curious geological phenomena. In Egypt itself, the worship of the deity subsisted till the fall of paganism, the image at Alexandria continuing to be worshiped till destroyed, 398 A.D., by Theophilus, archbishop of that town. Busts of S. are found in most museums, and his head or figure engraved on certain stones was supposed to possess particular mystic virtues. His temples were oracular, the votaries consulting him by sleeping and dreaming in them; and at Alexandria the priests connected his worship with the healing art.—Plutarch, *De Isid*, s. 28; Clemens, *Orat. Adhort.* p. 21; Tacit. *Hist.* iv. c. 83, 84; Strabo, Lib. xvii. p. 552; Macrobius, *Saturn*, i. 7, 25; Nixon, *Dell' Edifizio di Pozzuoli detto il Tempio di Serapide* (Nap. 1773); Wilkinson, *Mann. and Cust.* iv. p. 360; Gibbon, *Decline and Fall*, c. 28.

SERA'SKIER, or SERI-ASKER (Pers. head of the army), the name given by the Turks to every general having the command of a separate army, and, in particular, to the commander-in-chief or minister of war. The seraskier, in the latter sense, possesses most extensive authority, being subordinate only to the sultan and grand vizier; he is selected by the monarch from among the pashas of two or three tails.

SERENA'DE (Ital. *serenata*), originally music performed in a calm night; hence an entertainment of music given by a lover to his mistress under her window. Serenading has been chiefly practised in Spain and Italy. It is common among the students of the German universities to assemble at night under the window of a favorite professor, and give him a musical tribute.—A piece of music characterized by the soft repose which is supposed to be in harmony with the stillness of night, is called a serenade, or sometimes a *Nottorno*.

SERE'TH, an important affluent of the Danube, rises in the Austrian crownland of Galicia, runs southward through almost the whole length of Moldavia, and joins the Danube 5 miles above Galatz, after a course of 300 miles.

SERF (Lat. *servus*, a slave). A numerous class of the population of Europe known as serfs or villeins, were in a state of slavery during the early middle ages. In some cases, this serf population consisted of an earlier race, who had been subjugated by the conquerors; but there were also instances of persons from famine or other pressing cause selling themselves into slavery, or even surrendering themselves to churches and monasteries for the sake of the benefits to be derived from the prayers of their masters. Different as was the condition of the serf in different countries and at different periods, his position was on the whole much more favorable than that of the slave under the Roman law. He had certainly acknowledged rights—and this was more particularly the case with the classes of serfs who were attached to the soil. In England, prior to the Norman Conquest, a large proportion of the population were in a servile position, either as domestic slaves or as cultivators of the land. The name of *nativus*, generally applied to the serfs, seems to indicate that they belonged to the native race, the earliest possessors of the soil. The powers of the master over his serf were very extensive, their principal limitations being that a master who killed his serf was bound to pay a fine to the king, and that a serf deprived of his eye or tooth by his master was entitled to his liberty. The Norman Conquest made little change in the position of the serf. The lowest class of serfs were the *villeins in gross*, who were employed in menial household services, and were the personal property of their lords, who might sell them or export them to foreign countries; while the most numerous class, who were employed in agriculture, and attached to the soil, were called *villeins regardant*. These latter, though in some respects in a better position than the villeins in gross, might be severed from the land, and conveyed apart from it by their lord. They were incapable of enjoying anything like a complete right to property, inasmuch as it was held, in accordance with the principles of the Roman law, that whatever the slave acquired was his *peculium*, which belonged to his lord, who might seize it at his pleasure.

By a peculiarity in the usages of Britain, the condition of a child as regards freedom or servitude followed the father, and not the mother, and therefore the bastards of female villeins might be free. In France and Germany, besides the classes of serf alluded to, there were others whose servitude was of a milder description, and who were only bound to fixed duties and payments in respect of their lands.

The abolition of serfdom in Western Europe was a very gradual process, various causes having combined to bring it about. The church both inveighed against the practice of keeping Christians in bondage, and practised manumission to a large extent. In the course of time, usage greatly modified the rights and liabilities of the serf, whose position must have been considerably altered when we find him making stipulations regarding the amount of his services, and purchasing his own redemption. The towns afforded in more than one way a means of emancipation. A serf residing a year in a borough without challenge on the part of his lord, became *ipso facto* a free man; and the result of experience showed that the industry of the free laborer was quite as productive as that of the serf. At all events, serfdom died out in England without any special enactment; yet it was not wholly extinct in the latter half of the 16th c., for we find a commission issued in 1574 by Queen Elizabeth, to inquire into the lands and goods of all her bondsmen and bondswomen in the counties of Cornwall, Devon, Somerset, and Gloucester, in order to compound with them for their manumission, that they might enjoy all their lands and goods as freedmen. In a few rare instances, liability to servile duties and payments in respect of lands seem to have continued down to the reign of Charles I. In Scotland, as in England, serfdom disappeared by insensible degrees; but a remarkable form of it continued to survive down to the closing years of last century. Colliers and salters were bound by the law, independent of paction, on entering to a coal-work or salt-mine, to perpetual service there; and in case of sale or alienation of the ground on which the works were situated, the right to their services passed without any express grant to the purchaser.

The sons of the collier and salter could follow no occupation but that of their father, and were not at liberty to seek for employment anywhere else than in the mines to which they had been attached by birth. Statutes 15 Geo. III. c. 28 and 39 Geo. III. c. 56, restored these classes of workmen to the rights of freemen and citizens, and abolished the last remnant of slavery in the British Islands.

In France, though a general edict of Louis X., in 1315, purported to enfranchise the serfs on the royal domain on payment of a composition, this measure seems never to have been carried into effect, and a limited sort of villeinage continued to exist in some places down to the Revolution. In some estates in Champagne and Nivernais, the villeins, known as *gens de main morte*, were not allowed to leave their habitations, and might have been followed by their lords into any part of France for the *taille* or villein-tax. In Italy, one great cause of the decline of villeinage was the necessity under which the cities and petty states found themselves to employ the peasant population for their defence, whom it became expedient to reward with enfranchisement. In the 11th and 12th centuries, the number of serfs began to decrease and villeinage seems no longer to have had an existence in Italy in the 15th century. Over a large portion of Germany, the mass of the peasants had acquired their freedom before the end of the 13th c., but in some parts of the Prussian dominions a modified villeinage continued to exist until swept away by the reforms of Von Stein in the present century.

In Russia, where the feudal system never prevailed, the early condition of the peasant was not a servile one. Down to the 11th c., he could occupy any portion of the soil that he had the means of cultivating, the land being the property of all, and farmed on the purest communistic principles. The reduction of the peasantry to a state of serfdom, and their attachment to the soil, was gradually effected, and not completed till the close of the 16th century. The Russian peasant of the 19th c. was in some respects in as servile a condition as the feudal villein of the 12th c. in the west of Europe; but there was this peculiarity attaching to his position, that while he himself was the property of his lord, the land which he cultivated belonged to himself—a consideration which greatly complicated the question of his emancipation. The Emperor Alexander I. introduced various improvements in the condition of the peasantry, particularly those belonging to the crown, and in his reign serfdom was abolished in Courland and Livonia. The entire abolition of villeinage has been effected by the present emperor, Alexander II., by a very sweeping measure. From March 1863, the peasants, both husbandmen and domestics, have been made entirely free as regards their persons, while they have also obtained the perpetual usufruct of their cottages and gardens, and certain portions of land.—See, on the subject of

serfdom generally, Hallam's *State of Europe during the Middle Ages*, chap. 2.

SERGE, a kind of twilled worsted cloth of inferior quality. There is also a coarse kind of twilled silk used for lining gentlemen's coats called silk serge.

SE'RGEANTS (Fr. from Lat. *serviens*, serving) are non-commissioned officers of the army and marines in the grade next above corporal. They are selected from the steadiest among the corporals, and their duties are to overlook the soldiers in barracks, and to assist the officers in all ways in the field. They also command small bodies of men as guards, escorts, &c. Every company has four sergeants, of whom the senior is the color-sergeant. A superior class are the staff-sergeants, as the quarter-master-sergeant, armorer-sergeant, hospital-sergeant; and above them all is the sergeant-major. The daily pay of a sergeant varies from 1*s.* 11*d.* in the infantry to 2*s.* 11*d.* in the horse-artillery. For his privileges, see NON-COMMISSIONED OFFICERS. In ancient times, the rank of sergeant was considerably more exalted. In the 12th c., the sergeants were gentlemen of less than knightly rank, serving on horseback. Later, the sergeants-at-arms were the royal bodyguard of gentlemen armed *cap-à-pie*.

SE'RGEANTY, GRAND (Fr. *Sergenterie*, from Lat. *serviens*), a tenure by which lands were held in feudal times in England. After the Conquest, the forfeited lands were parcelled out by William to his adherents on condition of the performance of services of a military character. The military tenants of the crown were, however, of two descriptions: some held merely *per servicium militaire*, by knight-service; others held *per sergentiam*, by grand sergeanty, a higher tenure, which involved attendance on the king not merely in war, but in his court at the three festivals of the year, and at other times when summoned. Although the word baron, in its more extended sense, was applied to both classes of crown tenants, yet it was only those holding by grand sergeanty whose tenure was said to be *per baroniam*. In its earliest stage, the distinction between the greater nobility and lesser nobility or gentry in England was, that the former held by grand sergeanty, and the latter by knight-service only. In theory, lands held by sergeanty could not be alienated or divided; but practically this came to be often done, and by this means tenures by sergeanty became gradually extinct before the abolition of military holdings. Considerable misapprehension on the part of Dugdale and later writers has arisen from a double use of the word *serviens*, or sergeant, which is sometimes applied to a tenant either by grand sergeanty or knight-service who had not taken on himself the obligations attendant on knighthood.

The term petty sergeanty was applied to a species of socage tenure in which the services stipulated forebore some relation to war, but were not required to be executed personally by the tenant, or to be performed to the person of the king, as the payment of rent in spurs or arrows.

SERGI'PÉ, a maritime province of Brazil, bounded on the N. by the Sao Francisco, which separates it from Alagoas; on the W. and S. by Bahia; and on the E. by the Atlantic. According to the most recent statements, this province is the smallest in the empire. Area, 15,000 sq. m.; pop. 177,000. The shores are low and sandy, the interior mountainous. The east part is fertile, well-wooded, and produces sugar and tobacco; the western districts are devoted principally to the rearing of cattle. The chief town is Sergipe d'el Rey, at the mouth of the chief river—the Vasa Barris—and with a pop. stated at 9000.

SERINAGUR, SIRINUGGUR, or CASHMERE, the capital of the valley of Cashmere, stands on both sides of the Jhelum, which is here 100 yards wide, 170 miles north-north-east of Lahore. It is quaint and picturesque-looking almost beyond conception. The streets, or rather narrow lanes, lead to the river, and the houses, five and six stories high, are built of wood. Not a single straight line is to be seen. The houses overhang the river, and lean towards each other above the lanes in various stages of dilapidation. Communication between the two quarters is kept up by means of a number of rustic wooden bridges, built on enormous piles of timber. Shawls are an important article of manufacture (see CASHMERE). The manufacture of articles of papier-mâché, the designs of which are far in advance of the workmanship, and engraving on stone and metal, are also important branches of industry. The vicinity of the city, with its border of towering mountains, is exceedingly beautiful. The numerous lakes, connected with the town and river by canals, recall Venice to the traveler. The most notable public structures are the Jumna Musjid or 'Great Mosque,' capable, according to native estimate, of containing 60,000 persons, the mosque of Shah Hamedan, a royal tomb, and the governor's residence. Near the east end of the city lies the dal or Lake of Serinagur, about 5 miles long, and 2½ broad. It is a lovely and tranquil sheet of water, was formerly a choice retreat of the Mogul emperors, the remains of whose pleasure-grounds and palaces are still visible on its margin, the most celebrated being the Shalimar, of polished black marble. Pop. in 1871, 132.681; in the early part of the present century it is stated to have been from 150,000 to 200,000—*Captain Knight's Diary of a Pedestrian in Cashmere and Tibet* (1863).

SERINGAPATA'M (properly, *Shri Ranga Patanam*, City of Vishnu), a decayed city of Southern India, built on an island in the channel of the Kaveri, nine miles north-north-east of Maisur. The island, three miles long, and one mile broad, has a wretched appearance, and the town itself is ill-built, ill-ventilated, and ugly. The fort, about three-quarters of a mile broad, is surrounded by strong walls of stone, and contains the palace of Tipu Sahib (q. v.). In the days of its highest prosperity, S. is said to have contained 300,000 inhabitants; in 1800, it contained 31,895, and in 1871 it contained 10.594. Hyder Ali (q. v.) made it the seat of his government in 1765. It was besieged by Lord Cornwallis in 1791, and again in 1792. On the last occasion, the terms dictated by the commander of the British to Tipu, the son and successor of Hyder Ali, were very severe. A British army appeared before the walls again in 1799, and on the 3d May of that year, the fort was stormed, and Tipu slain in the vicinity of his own palace.

SERJEANT-AT-ARMS, in the English Court of Chancery, is the officer who attends upon the Lord Chancellor with the mace, and who executes by himself or deputies various writs of process directed to him in the course of a Chancery suit, such as apprehending parties who are pronounced to be in contempt of the court. A similar officer attends on each House of Parliament, and arrests any person ordered by the House to be arrested.

SERJEANT-AT-LAW used to be the highest degree of barrister in the common law of England, and was called serjeant-counter, or of the coif. The degree is of great antiquity, and formerly a barrister could only be appointed after being of sixteen years' standing. Formerly, also, they had exclusive audience in the Court of Common Pleas. No appointments have been made of late, and the order was nearly extinct in 1883. The proper forensic dress of serjeants was a violet-colored robe with a scarlet hood. A serjeant was appointed by a writ or patent of the crown. The Chief Justice of the Common Pleas recommended the barrister to the Lord Chancellor, who advised the crown. The degree of Serjeant was entirely honorary, and merely gave precedence over barristers; and when he was appointed, he was rung out of the Inn of Court to which he belonged, and thereafter joined the brotherhood of Serjeants, who formed a separate community. By ancient custom, the common law judges were always admitted to the order of serjeants before sitting as judges, but this practice was abolished in 1874. A Queen's Counsel (q. v.) takes precedence of all serjeants, unless these have patents of precedence, which prevent them being displaced by the Queen's Counsel who come after them. Sometimes one or more of the serjeants are appointed Queen's Serjeants.

SE'ROUS FLUIDS. This term is applied by chemists and physicians to various fluids occurring in the animal body. They are arranged by Gorup-Besanez, one of the highest authorities on Physiological Chemistry, under three heads: 1. Those which are contained in the serous sacs of the body, as the cerebro spinal fluid, the pericardial fluid, the peritoneal fluid, the pleural fluid, the fluid of the tunica vaginalis testis, and the synovial fluid. 2. The tears and the fluids existing in the eyeball, the amniotic fluid, and transudations into the tissue of organs. 3. Morbid or excessive transudations, such as dropsical fluids, the fluids occurring in hydatids, and in blebs and vesicles on the skin, and transudations from the blood in the intestinal capillaries, as in cases of intestinal catarrh, cholera, or dysentery.

All these fluids bear a close resemblance to one another, both in their physical and chemical characters. In so far as relates to their physical characters, they are usually clear and transparent, colorless or slightly yellow, of a slight saline, mawkish taste, and exhibiting an alkaline reaction with test-paper. They possess no special formal or histological elements, but on a microscopic examination, blood-corpuscles, cells of various kinds, molecular granules, and epithelium may occasionally be observed in them. The ordinary chemical constituents of these fluids are water, fibrin (occasionally), albumen, the fats, animal soaps, cholesterin, extractive matters, urea (occasionally), the same inorganic salts which are found in the serum of the blood, and the same gases as occur in the blood. As rare constituents, and only occurring in disease, may be mentioned sugar, the biliary acids, salts of lactic and succinic acids, creatinine, mucin, &c. The following

analyses of four of these fluids will serve to give a good idea of their composition:

	Plasma of the Blood.	Peritoneal Dropsy.	Hydro-thorax.	Dysenteric Transudation.
Water	901·51	946·0	936·0	958·6
Solid Constituents	98·49	54·0	64·0	41·4
Fibrin	8·06		0·6	
Albumen }	81·92	33·0	52·8	15·0
Extractive Matters }		13·0	3·0	14·6
Inorganic Salts	8·51	8·0	7·4	11·8

SEROUS MEMBRANES. There are seven of these membranes in the human body, three being median and single, while two are double and lateral. They are the arachnoid, the pericardium, and the peritoneum, with the two pleuræ and tunicæ vaginales testis. Thus they are connected, with the obvious view of facilitating motion and affording general protection, with all the most important organs in the body. They are all closed sacs, with one exception, and a reference to the articles PERICARDIUM, PERITONEUM, and PLEURÆ, will at once show the reader that each sac or continuous membrane consists of two portions—a parietal one, which lines the walls of the cavity, and a visceral, or reflected one, which forms an almost complete coating or investment for the viscera contained in the cavity. The interior of the sac is filled during life with a halitus or vapor, which after death condenses into a serous fluid. With regard to their structure, it is sufficient to state that they consist essentially of (1) Epithelium; (2) Basement Membrane; (3) A stratum of areolar or cellular tissue, which constitutes the chief thickness of the membrane, and is the constituent on which its physical properties are mainly dependent. This layer is more liable to variation than the others, and one of the most common alterations is an augmentation of the yellow fibrous element, by which an increased elasticity is given to the membrane, which is thus better adapted for distention, and for a subsequent return to its original bulk. The situations in which this augmentation is found are, as Dr. Brinton (*Cyclopædia of Anatomy and Physiology*, vol. iv. p. 524) has pointed out, in exact conformity with this view: in the peritoneum, which lines the anterior abdominal wall, and covers the bladder, it attains its maximum; in the detached folds of the mesentery, in the costal pleuræ, and in the suspensory ligament of the liver, it is still very prominent; while on the posterior wall of the belly, and in serous membranes covering the heart, liver, &c., it is almost absent.

The following are the most important of the morbid changes to which these membranes are liable. One of the most frequent of the morbid appearances seen in these structures is the presence of an excess of serous fluid in their cavity. This condition occurs in deaths from various diseases, and in general the serous membrane only shares in a dropsy which is common to other structures, and especially affects the areolar or cellular tissue. When general anasarca, or dropsy of the cellular tissue, has existed for a long time, more or less dropsical effusion is usually found in the pleuræ and peritoneum. The inflammation of these structures is sufficiently described in the articles PERICARDITIS, PERITONITIS, and PLEURISY. Tubercle is seldom primarily deposited in these membranes, although it is not uncommon after other organs have been implicated. Cancer and ossification of the serous membranes are rare affections, but cysts of various kinds, some of which are of parasitic origin, are often found.

Synovial membranes present many points of similarity to serous membranes; as, however, they also present several points of difference, they will be briefly noticed in a special article.

SERPENT, a powerful bass musical wind instrument, consisting of a tube of wood covered with leather, furnished with a mouthpiece like a trombone, ventages, and keys, and twisted into a serpentine form, whence its name. Its compass is said to be from B♭ below the bass staff to C in the third space of the treble clef, including every tone and semitone—  , but the highest octave does not sound well with ordinary players. When unskillfully played, it exhibits the most startling inequalities of tone, in consequence of there being three notes much more powerful than the rest. The serpent is in B♭, and therefore music for it must be written a whole tone above the real sounds. The serpent was invented by a French priest at Auxerre in 1590, and while its principal use has been in military music, it has also been employed in the orchestra to reinforce the basses. As an orchestral, and even as a military instrument, the serpent is far less manageable than the Ophicleide (q. v.), which has nearly superseded it. It is still much used in the music of the Roman Catholic Church.

SERPENTA'RIA. See ARISTOLOCHIA.

SERPENT-CHARMING, an art which has been practised in Egypt and throughout the East from remote antiquity, and which forms the profession of persons who employ it for their own gain, and for the amusement of others. In India, and partly if not entirely in other countries, this profession is hereditary.

There are several allusions to serpent-charming in the Old Testament: see Psalm lviii. 4, 5; Eccles. x. 11; Jer. viii. 17. It is mentioned also by some of the ancient classics, as Pliny and Lucan.

Serpent-charmers usually ascribe their power over serpents to some consitutional peculiarity, and represent themselves as perfectly safe from injury even if bitten by them. To confirm this, they are accustomed, in their exhibitions, to exasperate the serpents, and allow themselves to be bitten, so that blood flows freely. But it has been fully ascertained that the serpents which they carry with them, and produce on these occasions, although of the most venomous kinds, have been at least deprived of their poison-fangs, and to prevent new ones from growing, a portion of the maxillary bone is often if not always taken out; in some cases, it appears that the poison-glands themselves are removed by excision and cautery.

So much, however, being set aside as of the nature of a mere juggler's trick, much still remains which is interesting, and in which there is unquestionable reality. The serpent-charmers of the East have a power beyond other men of knowing when a serpent is concealed anywhere, long practice having probably enabled them to distinguish the musky smell which serpents very generally emit, even when it is too faint to attract the attention of others. They are therefore sometimes employed to remove serpents from gardens and the vicinity of houses. In this, as in their exhibitions, they pretend to use spells. What power the tones of their voice may exert, is of course uncertain; but they accompany their words with whistling, and make use also of various musical instruments, the sound of which certainly has great power over serpents. When they issue from their holes, the serpent-charmer fearlessly catches them, by pinning them to the ground by means of a forked stick. But one of the first things he does afterwards is to knock out or extract the poison-fangs.

In the exhibitions of serpent-charmers, the creatures are often made to twine round the bodies of the performers. They also erect themselves partially from the ground, and in this posture they perform strange movements to the sound of a pipe, on which the serpent-charmer plays. It appears also that he exerts a very remarkable influence over them by his eye, for even before any musical sound has been employed, he governs and commands them by merely fixing his gaze upon them.

In 1850, a party of Arab serpent-charmers visited London, where exhibitions took place similar to those which are common in the East.

SE'RPENTINE, a mineral, composed of silica and magnesia in almost equal proportions, with about 13—15 per cent. of water, and a little protoxide of iron. S. is generally massive; very rarely crystallized in rectangular prisms. COMMON S. sometimes occurs as a rock. It is unctuous to the touch, and soft enough to be scratched by calcareous spar. It is not easily broken, but can be cut without much difficulty. It is generally green, black, or red; the color sometimes uniform, sometimes spotted, clouded, or veined. It receives its name from the serpent-like form which the veins often assume. It is cut and turned into ornaments of various kinds. PRECIOUS S. or NOBLE S., is of a rich dark-green color, hard enough to receive a good polish, translucent; and sometimes contains embedded garnets, which form red spots, and much add to its beauty. It is a rare mineral. It occurs at Baireuth in Germany, in Corsica, at Portsoy in Banffshire, in the Shetland Islands, &c. It is generally found along with foliated limestone, in beds under gneiss, mica-slate, &c., or in Common Serpentine. The ancient Romans used it for pillars and for many ornamental purposes; and vases, boxes, &c. are still made of it, and much prized. The ancients ascribed to it imaginary medicinal virtues.

S. beiongs to the metamorphic rocks. It occurs as an irregularly overlaying mass in the Lizard district of Cornwall, as a dyke at Portsoy, and as nodular aggregations in the granite of Aberdeenshire. It is generally associated with the granitoid, igneous, or metamorphic rocks, though it is occasionally found as a member of the trappean series. Trap dykes, in passing through or coming into contact with limestone, not unfrequently convert it into serpentine, or fill it with lines or masses of serpentine.

SERPENTS (*Ophidia*) an order of Reptiles, which is in general simply characterized as having a very elongated body and no external limbs. The links, however, which unite saurians with serpents are very numerous; the limbs of many saurians being partially wanting, and little more than rudimentary; whilst rudimentary limbs are found by anatomical examination in many serpents, and the rudimentary hinder limbs of some, as boas, appear externally in the form of hooks or claws. See BOA.

The body and tail are covered with scales, the head often with plates. The vertebræ and ribs are extremely numerous, a pair of ribs being attached to each vertebra throughout the whole length of the body. Some serpents have more than 300 pair of ribs. The ribs not only serve to give form to the body, and aid in respiration, but are also organs of locomotion. There is no breast-bone (*sternum*) for the small end of the ribs to be attached to, as in other vertebrate animals, but each rib is joined by a slender cartilage and a set of short muscles to one of the scales of the

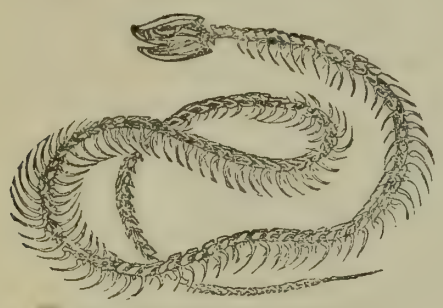


Fig. 1.—Skeleton of the Rattlesnake.

abdomen. A serpent moves by means of the ribs and of these scales, which take hold on the surface over which it passes, and in this way it can glide—often very rapidly—along the ground, or on the branches of trees; and many species climb trees with great facility, gliding up them as if on level ground. Most—if not all—of the species are also capable of elevating a great portion of the body from the ground; and many of those which live among the branches of trees hold their place firmly by means even of a few scales near the tail, and freely extend the greater portion of the body in the air. On a perfectly smooth surface, as that of glass, a serpent is quite helpless and has no power of locomotion.

The vertebræ of serpents are so formed as to admit of great pliancy of the body, which is capable of being coiled up, with the head in the center of the coil, and some serpents have the power of throwing themselves to some distance from this coiled position. The vertebræ are articulated by perfect ball-and-socket joints, the anterior extremity of each being rounded into a smooth and polished ball, which fits exactly into a hemispherical cup in the next; but there are processes in each vertebra which prevent any motion except from side to side, so that serpents are quite incapable of the vertical undulations so often represented in prints. The ribs are also attached to the vertebræ by ball-and-socket joints.

Cuvier divided serpents into three sections, the first—of which the common Blindworm (q. v.) or Slow-worm of Britain is an example—consisting of those which have the skull, teeth, and tongue similar to those of saurians, and in which the eye has three lids, and there are vestiges of bones of anterior limbs; the second, which Cuvier calls True Serpents, having no vestiges of such bones, the eye destitute of lids, and the bones of the head so formed that the mouth and throat are capable of very great dilation; the third, which he calls Naked Serpents, containing only the genus *Cæcilia* (q. v.), now known, notwithstanding its form, to belong really to the Batrachians or Amphibia.

The serpents of Cuvier's first section have been conjoined with some of the nearly allied saurians, more or less furnished with external limbs, under the name *Saurophidia*, by Mr. Gray. They are connected with the True Serpents by the families *Amphisbænidæ* and *Typhlopsidæ*, which nearly agree with them in the structure of the head and mouth, but want the third eyelid—some of the *Typhlopsidæ*, indeed, having the eye itself merely rudimentary—and, like the True Serpents, have no vestige of breast-bone or shoulder. These, with all the creatures included in this section, are, in so far as is known, perfectly harmless. They live chiefly on insects and other very small animals.

The True Serpents live on larger prey, which they swallow entire, some of them—as the boas—crushing it by constriction in the coil of their muscular body. The prey of a serpent is often thicker than the serpent itself, and to admit of its being swallowed, the throat and body are very dilatable. The bones of the head are adapted to the necessity of a great expansion of the mouth and dilation of the throat, as will be seen by the annexed figure of the distended jaws of the rattlesnake. The bones composing the upper jaw are loosely joined together by ligaments; and even the arches of the palate are movable. The two halves of the lower jaw are connected by a ligament, so loose and elastic that they are capable of separation to a great extent; and the mastoid and tympanic bones, which connect the lower jaw and the skull, are lengthened out into pedicles, allowing an extraordinary power of dilation. Serpents, however, sometimes seize prey too big for them to swallow, and die in the attempt, their teeth being so formed as to render it difficult to reject by the mouth what has once got into the throat.

Fig. 2.

The teeth of the True Serpents are simple, and directed backwards. In the non-venomous kinds, there are four rows on the upper part of the mouth, two rows on the jaws, and two on the palate; each division of the lower jaw is also armed with a single row. In vipers, rattlesnakes, and other venomous serpents, there are no teeth on the upper jaw, except the poison-fangs; the palatal teeth, however, forming two rows as in the non-venomous kinds, the arrangement of teeth in the lower jaw being also the same. Venomous serpents do not, in fact, need the same array of teeth as the non-venomous; depending rather on the power of their venom for their prey, which they suddenly wound, and then wait till it is dead. The poison-fangs are long in comparison with the other teeth; they are two in number, firmly fixed into a movable bone; when not in use, they are laid flat on the roof of the mouth, covered by a kind of sheath formed by the mucous membrane of the palate; when the animal is irritated, and about to assail its enemy or its prey, they stand out like two lancets from the upper jaw. They move with the bone into which they are fixed; and the bone and muscles are so arranged that the opening of the mouth brings them into the position for use. There is above them, and towards the back of the head, a large gland for the elaboration of the poison, which is forced through them by the action of the muscles, each fang being tubular. The tube of the fang is formed, not as by a hollowing of it, but as by a bending of it upon itself, and is situated in front. The opening near the fang's point is a narrow longitudinal fissure. The poison-fangs are very liable to be destroyed, and the germs of new ones are generally found behind them, ready to grow and supply their place.

It is sometimes stated as a distinction between venomous and non-venomous serpents, that the former have only two rows of teeth on the upper part of the mouth, whilst the latter have four. This rule must not, however, be accepted without qualification. In the marine serpents (*Hydridæ*), there are rows of maxillary teeth behind the poison-fangs; and some of the venomous land-serpents, as the Bongars or Rock Snakes of the East Indies, which, however, are not amongst the most venomous, have some smaller teeth in the jaw-bones behind the poison-fangs.

The venom of serpents differs very much in its deadly power in different species. The bite of some causes the death of a human being in a few minutes, so that no creatures are more formidable; that of others proves fatal after the lapse of hours; whilst the bite of others, such as the common viper, is seldom fatal, although causing great pain and many unpleasant consequences. 'I have carefully examined all the evidence on record,' says Mr. Buckland, 'as regards the most efficacious internal remedy that can be given in such cases, and have come to the conclusion that nothing is so good as ammonia' (*Curiosities of Natural History*). The same writer also recommends brandy or other stimulating drinks to be taken in large quantities. But it is of the utmost importance to suck the wound as soon as possible after it has been inflicted, and no danger is to be apprehended in doing so, if there be no scratch or sore about the mouth, for the poison, so deadly when it mixes with the blood, is quite innocuous when taken into the stomach.

Many antidotes to the poison of serpents are in vogue in different countries, most of them, if not all, utterly unworthy of regard. Dr. Fayrer believes that the bite of the cobra, elaps, and Russell's viper is almost certain death. *Tight* ligatures above the bitten part, to stop the circulation of the poisoned blood; excision; cauterizing with live coal, red-hot iron, or gunpowder; application of ammonia, and repeated doses of alcohol, are the chief remedies to be tried; but they must be resorted to *immediately* after the patient has been bitten.

The peculiarities of the lungs of serpents are noticed in the article REPTILES. The heart is placed very far back in the body. The intestines have a great absorbent power, and the fæces consist only of the most indigestible portions of the prey in an extremely dessicated state; the members of the animal which has been swal-

lowed being still often distinguishable, and hair, scales, and the like remaining unchanged.

The tongue of serpents is forked, and is often thrust out of the mouth. It is vulgarly regarded as the *sting*, but serpents have no sting, their only weapons being the fangs already noticed. The only sound which serpents emit is that of hissing.

Serpents are either strictly oviparous or they are ovoviviparous. The non-venomous serpents are generally oviparous; the venomous, ovoviviparous. The eggs of those which lay eggs are generally deposited in a long string, connected by a kind of viscous substance, in some heap of decaying vegetable matter, the mother paying no further heed to them. But some serpents coil themselves around their eggs and hatch them; and it would even seem that the habits of the same species differ as to this, in different climates. The eggs of serpents are not quite devoid of calcareous covering, but have so little that their integument is soft and pliable.

It has been often alleged that vipers and other serpents, when alarmed, swallow their young, and eject them again after reaching a place of safety. There still remains some doubt on this curious question, which has been much discussed; and it is not improbable that the alleged proofs of it from living young ones issuing out of the body of the parent when crushed, are to be accounted for by the ovoviviparous mode of generation.

It seems probable that serpents do not possess the senses of taste or smell in great perfection. The ear has no external opening, and no tympanum, nor is it certain that their hearing is acute, but they are remarkably sensible of the power of music, of which serpent-charmers avail themselves, both to bring them from their holes and to control them. See SERPENT-CHARMING. A European gentleman, residing in one of the mountainous parts of India, found that his flute attracted them in such numbers to his house that he was under the necessity of ceasing to play it. Their eyes are small, and are protected from the dangers to which they might otherwise be exposed by a transparent integument connected with the skin, and which comes away with the skin when the old skin is cast off, as is the case at least once a year.

The colors of serpents are very various, and often very beautiful. As a general rule, but not without exceptions, the venomous species are of darker and more uniform color than the non-venomous. The aversion and horror with which serpents are so generally regarded, are of course due to the dangerous character of so many of them, and the difficulty of observing and avoiding them.

Serpents are used as food by some savage tribes. They are capable of being tamed, and some of the non-venomous species have frequently been so, and have been found useful in killing mice, rats, and other such vermin.

Serpents abound chiefly in tropical climates, although some are found in northern countries, as in Scandinavia. The British species were long supposed to be only two in number, the Common Snake (*Tropidonotus natrix*), and the Viper or Adder (*Pelias berus*),

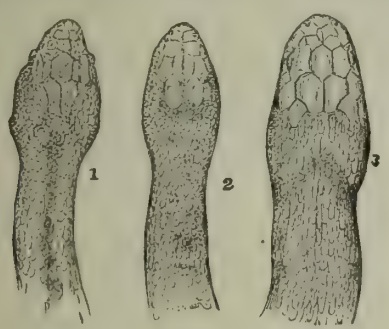

Fig. 3
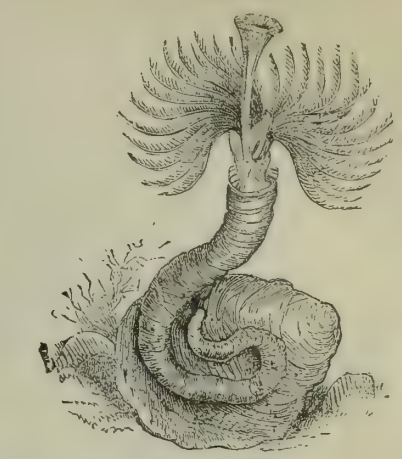
1. Viper; 2. Coronella lævis; 3. Common Snake.

the latter alone being poisonous; but the harmless Coronella (q. v.) (*Coronella lævis*), which is widely distributed over the continent of Europe, has also occurred in Britain. These three forms may be readily distinguished one from another (see fig. 3), and from the Blindworm (*Anguis fragilis*), which, as already stated, is a limbless lizard. See Huxley's *Comparative Anatomy of Vertebrated Animals;* Cassell's *Natural History;* Fayrer's *Thanatophidia of India;* and British Museum *Catalogue of Snakes.*

SERPUKO'V, a very ancient Russian town, 56 miles south of Moscow, close to the left bank of the Oka. It contains a cathedral, and is defended by a Kreml, or citadel. There are upwards of 50 factories, of which those engaged in the manufacture of cotton prints, sailcloth, woollen goods, and leather are of importance. Pop. (1880) 16,720.

SE'RPULA, a genus of Annelida, of the order *Tubicolæ*, forming and inhabiting a calcareous tube, like that of molluscs, and therefore described in old works on conchology. Indeed, the shell of a S. is not always easily distinguished from that of molluscs of the genus *Vermetus*, although the inhabitants are extremely different; but the shell of *Vermetus* has a regular spire at the apex, which is not found in that of any serpula. The serpulæ attach their shells to rocks, shells, &c., in the sea. The shell is



Serpula contortuplicata, on the back of an Oyster-shell.

variously contorted, and some of the species live in groups, with the shells intertwined. The wider end of the shell is open, and from it the animal protrudes its head and gills, which expand as beautiful fan-like tufts. They are in general exquisitely colored, and serpulæ are among the most interesting and beautiful creatures that can be placed in an aquarium. On the slightest alarm, they disappear completely into the tube, which then is closed by an operculum curiously framed as an appendage to the gills. Several species of S. are common on the British coasts, but the largest are found in tropical seas, and are among the many lovely objects to be seen in looking down through clear still water on coral reefs.

SERRAVA'LLÉ, a city of Northern Italy, in Venetia, on the river Aleschio, 35 miles north of Venice. It is situated in a valley, and was formerly fortified. The cathedral S. Andrea is very ancient. Pop. 5400.

SERTO'RIUS, Q., one of the ablest Roman commanders in the later ages of the Republic, was a native of Nursia, in the country of the Sabines, and began his military career in Gaul. He fought, 105 B.C., in the disastrous battle on the Rhone in which the Roman proconsul, Q. Servilius Cæpio, was defeated by the Cimbri and Teutones, and took part in the splendid victory at Aquæ Sextiæ (mod. Aix.), 102 B.C., where Marius annihilated the same barbarians. On the breaking out of the sanguinary struggle between the party of the nobles under Sulla (q. v.) and the popular party headed by Marius (q. v.) (88 B.C.), he espoused the cause of the latter. Morally, he was much superior to the military adventurers of his time; and the impression we have of him from Plutarch's picturesque biography is that of a valiant, resolute, honest, and stubborn Roman, such as was commoner in the 3d than in the 5th c. of the Republic. None of the Marian generals held out so long or so successfully as he against the victorious oligarchy. He fought in conjunction with Cinna the battle of the Colline Gate, which placed Rome at the mercy of the Marians, but he had no hand in the bloody massacres that followed. What we do hear of him is to his credit. He got his own troops together, and slew 4000 of the ruffianly slaves whom Marius was permitting to plunder and ravish at will through the city. On the return of Sulla from the East (83 B.C.), S. withdrew into Etruria, but finding it impossible to act in concert with the other military leaders of his party, he went to Spain, where he continued the struggle in an independent fashion. At first he was not very successful, and found it advisable to embark for Mauritania. After several adventures, in the course of which he once passed through the Strait of Gibraltar, and fell in with some sailors who had visited the Atlantic islands, and whose descriptions so wrought upon his imagination, that he 'was seized with a strong desire to dwell in the islands, and to live in quiet, free from tyranny and never-ending wars'—(Plutarch)—he returned to the Peninsula, at the invitation of the Lusitanians, got together an army composed of natives, Libyans and Romans, and after a time became the virtual monarch of the whole country. During 80—76 B.C., he was victorious over all his opponents, nor was it until the arrival (76 B.C.), of young Pompey ('Pompey the Great'), that he found an opponent worthy to cope with him; and even Pompey was scarcely yet his equal in military skill.

S. drove Pompey over the Iberus (Ebro) with heavy loss; nor was the campaign of the following year (75 B.C.), more favorable.

for though S.'s subordinates were twice beaten, Pompey himself had no success, and was forced to write urgent letters to the senate for reinforcements. The campaigns of the next two years were unimportant, except in so far as they show us the gradual operation of that miserable jealousy and envy of S. that brought about his ruin. Perperna, and other Roman officers of the Marian party, who had fled to him in 77 B.C., when Sulla became triumphant at home, and who seem to have been a set of base adventurers, secretly stirred up the Spaniards against him, and when that artifice did not prove so successful as was hoped, they conspired against his life, and assassinated him in his own tent, 72 B.C., under circumstances of shameful perfidy. With S. the Marian or popular cause sunk, until it was revived and attained final success in the person of Julius Cæsar (q. v.). Plutarch has written S.'s life, and Corneille has made it the subject of a tragedy.

Sertularia Ingra, with a portion magnified.

SERTULA'RIA, a genus of Campanularian Hydroids, in which the branched horny investment of the plant-like colony forms a cup around each polyp. The polyps are arranged in double row, and the colony is attached to stones, shells, seaweeds, &c. Numerous species of S. occur round the British coasts. See HYDRA, MEDUSA; and Hincks, *British Hydroid Zoophytes*.

SE'RUM. See BLOOD.

SE'RVAL (*Felis Serval* or *Leopardus Serval*), one of the smaller *Felidæ*, a native of South Africa, the *Boschkatte*, or Bush-cat, of the Cape Colony. It is about two feet in length, exclusive of the

Serval (*Felis Serval*).

tail. The S. is a beautiful animal, yellowish with black spots, the lower parts white with black spots. The fur of the S. is in great request, and is know to furriers as that of the *Tiger Cat*. The S. is one of the mildest and most docile of the *Felidæ*.

SERVANT. See MASTER AND SERVANT.

SERVETUS, MICHAEL, or in his native Spanish, MIGUEL SERVEDE, a notable and unfortunate speculator in theology, was born at Villanueva, in Aragon, in 1509. At the age of nineteen, he quitted Spain, and commenced the study of law at Toulouse, which he soon abandoned to devote himself with ardor to the knotty points of the Reformation doctrines. In 1530, he went to Basel to hear Œcolampadius, and thence to Strasburg, where Bucer and Capito taught. His daring denial of the doctrine of the Trinity frightened or angered these divines to such a degree that they denounced him as 'a wicked and cursed Spaniard.' S. appealed from their judgment to that of the public in his *De Trinitatis Erroribus Lib. VII.* (Haguenau, 1531; modern edition, Nürnberg, 1791), and his *Dialogues* (Haguenau, 1532); but the public thought as little of his teaching as the theologians; and to avoid the odium which it had occasioned, he changed his name to Michael de Villanueva, and fled to Paris, where he studied medicine under Sylvius and Fernel, and took his degree as a physician with honors.

S. seems to have possessed a kind of penetrating, if also rash and reckless intellect, which enabled him to *hit* truth occasionally in his flighty researches, or, at least, to make happy guesses in the right direction. Thus, for example, he had an idea (see M. Flourens in the *Journal des Savants*, April 1854) of the doctrine of the circulation of the blood. He attacked Galen and the Faculty with his customary violence in a treatise on Syrups (*Syruporum Universa Ratio*, Paris, 1537; Lyon, 1546). About this time, he made the acquaintance of Calvin, with whom he had several conferences or private disputations, the result of which was a public challenge; but S., after assenting to the arrangements, decamped, afraid probably, and not without reason, that his precipitate imperious way of thinking did not fit him for discussing with so cool, wary, and merciless a logician as the Genevese reformer; afraid, too, perhaps, of being unceremoniously handed over to the authorities for heresy! After living successively for some time at Lyon, Charlieu, and Avignon, and supporting himself by writing for the booksellers, he found an asylum in the palace of Pierre Paulmier, Archbishop of Vienne, in 1541, where he remained for some years, and wrote his famous *Christianismi Restitutio*, first published in 1553. The work has been twice reprinted, first by Dr. Meade of London (incomplete), and again by Murr, at Nürnberg, in 1790. Its celebrity is due more to the fact, that it sealed the fate of its author, than to its intrinsic merits, the ideas being obscure, and the style incorrect. After its publication, S. wished to go to Italy, by way of Switzerland, but in passing through Geneva, was arrested and imprisoned at the instigation of Calvin (q. v.). After a long and complicated judicial procedure, S. was condemned to be burned, and the sentence was carried into execution, 27th October 1553. The fate of S., after all palliations are weighed, remains a dark stain on the memory of Calvin. See Willis's *S. and Calvin* (1877).

SERVIA (*Srbija*), proclaimed a kingdom in 1882, but a principality tributary to Turkey till 1878, when the Berlin Conference recognized its independence. Its frontiers touch those of Austria, Roumania, Bulgaria, and Turkey. Area, 18,720 square miles; pop. (1880) 1,700,211 (of the present area, 4000 sq. miles were added in 1878, and of the pop., over 300,000). The country is mountainous and densely wooded. From the interior, numerous chains proceed northward, forming massive barriers both on the eastern and western frontiers, and sloping pretty steeply towards the swampy plains along the Save and the Danube. In the extreme north-east, near Orsova, they reach the very edge of the Danube, and along with the Eastern Carpathians on the opposite shore, imprison the great river within a wall of rock, known as the *Iron Gate* of the Danube. The highest of these chains is the Rudnik Mountains (gathered into a knotty group about the center of the state), which in the Great Schturaz attains an elevation of 3400 feet. The *Schumadia*, or Forest, extends sonthwards from Belgrade for 60 miles. Beautiful landscapes are everywhere to be seen. The principal rivers (Serb. *Rjeka*) flowing through the country are the Morava and Timok, affluents of the Danube; and the Kolubara, an affluent of the Save, which itself falls into the Danube at Belgrade. The climate is temperate and salubrious, but somewhat cold in the higher regions. The soil in the valleys and level districts is fertile, and equally fitted for the rearing of cattle, the favorite occupation of the people, and the production of corn and wine; but not more than ⅛th of the land is under tillage; the remainder is forest or wilderness. Oak is the most common wood, but chestnuts and fruit-trees of all sorts abound, especially pears, of which there are whole forests in some places. The mountains are believed to be rich in copper and silver, but mining is almost unknown, and manufacturing industry is in the most backward condition.

Constitution, &c.—In 1881, S. paved the way for its recognition as a kingdom. Its constitution dates from 1869. The legislative power resides partly in the prince, partly in the *Skupschtina* or National Assembly. There are six ministers. The Council of State or Senate is a deliberative, not legislative, body, and has the duty of drafting the laws to be submitted to the Skupschtina. This Council comprises one member for each of the twenty-two districts into which S. has been divided since its enlargement in 1878. The Skupschtina now consists of 160 members, of whom 40 are nominated by the government and 120 elected by the people, at the rate of one deputy for every elector. The electors must be 21 years old and pay all the direct taxes.—The army has since 1878 been remodelled and extended. The actual army is about 8000 strong. The number of men available for the permanent army is about 50,000. The first *van* of the national army (or landwehr) comprises 125,000 men; the second, 90,000; so that the total military force of S. in time of war is 265,000 men.

Religion, Education, and Finance.—The inhabitants nearly all belong to the Greek Church, but are independent of the Patriarch of Constantinople. Ecclesiastical affairs are managed by a Metropolitan, whose seat is at Belgrade, and by the three bishops of Uzitza, Shabatz, and Timok. For the few who acknowledge the authority of the pope and the Latin Church, there is a bishop *in part. infid.*, but who resides at Diacobar in Austrian Slavonia. S., according to recent estimates, had 298 churches, 651 parishes, and 652 priests, besides 38 cloisters. It also possessed upwards of 300 educational institutions, including several gymnasia, a Lyceum for philosophical and juristic studies, a theological college, an artillery school, a school of agriculture, and 300 elementary schools for boys, and 13 for girls! These schools are not under the control of the clergy, and education is consequently making rapid progress. In 1878–79, the revenue of S. was £760,000, the expenditure being £745,000; the national debt is about £1,500,000.

Character.—The Servians are distinguished for the vigor of their

frame, their personal valor, love of freedom, and glowing poetical spirit. Their manners and mode of life are exceedingly picturesque, and strongly prepossess a stranger in their favor. They rank among the most gifted and promising members of the Slavic family.

History.—In the earliest times of which we have record, S. was inhabited by Thracian or Illyrian races—the Bessi, Scordisci, Dardanii, and Triballi. Shortly before Christ, it was subjugated by the Romans, and under the name of *Mœsia Superior*, formed part of the province of Illyricum, whose fortunes it shared during the vicissitudes of the empire. Overrun successively by the Huns, Ostrogoths, Longobards, &c., it reverted to the Byzantine rulers about the middle of the 6th c., but was wrested from them by the Avars in the 7th c., to oppose whom the Emperor Heraclius, about 636, invoked the aid of the Serbs from Eastern Galicia. The Serbs obeyed the call, and in less than two years drove the Avars from the land, over which they themselves spread in great numbers, their settlements extending from the Morava as far west as the Dalmatian Alps and the Adriatic, and from the Save as far south as the Balkan and Lake Scutari. About the middle of the 9th c., they were converted to Christianity by missionaries sent by the Emperor Basilius, but this did not in the least abate their natural ardor for battle, and for nearly 200 years they were almost constantly at war with the neighboring Bulgarians—the inveterate enemies of their Byzantine liege lord. In 1043, however, Stephen Bogislav expelled the imperial governors; and during 1050—1080, his son, Michael, made himself wholly independent, took the title of king of S., and procured the recognition of his royal dignity from Pope Gregory VII. For the next hundred years, the Serbs had to fight hard to maintain their independence, but the struggle terminated in their favor; and in 1165, Stephen Nemanja founded a dynasty which lasted for two centuries, during which period the kingdom of S. attained the acme of its power and prosperity.

Under Stephen Dushan (1336—1356), the greatest monarch of the Nemanja dynasty, it embraced the whole of Macedonia, Albania, Thessaly, Northern Greece, and Bulgaria. The progress of the Turkish arms, however, was fatal to its welfare, and in 1389 King Lazar fell in the disastrous battle at Kossovopolje. Sultan Bajazet divided the country between Lazar's son, Stephen, and Lazar's son-in-law, Vuk Brankovitch, but compelled both to pay tribute, and to follow him in war. Gradually the Serbs sunk more and more under the Turkish yoke, until, in 1459, S. was thoroughly subjugated by the Sultan Mahmud. It was uniformly the theater of the bloody wars between Hungary and Turkey, and frequently suffered the uttermost horrors of devastation. Prince Eugene's brilliant successes for a moment flashed a ray of hope into the miserable hearts of the long-suffering Serbs, and by the treaty of Passarowitz (1718), a considerable portion of the country was made over to Austria; but in 1739 it reverted to Turkey, and for the next 60 years the cruelty and oppressions of the Pashas and their Janizaries surpasses all belief. At length the unhappy people could endure the tyranny of their foreign masters no longer, and in 1801 an insurrection broke out, headed by George Czerny (q. v.), which by the help of Russia, ended in the triumph of the patriots, and in the election of Czerny by the people as Prince of Servia. The invasion of Russia by France, however, left the Serbs at the mercy of their late rulers, and the war again broke out. Czerny was forced to flee, and the tyranny of the Turks became more ferocious than ever. Again the people flew to arms under the leadership of Milosch Obrenovitch, and were a second time successful in winning back their liberties. Milosch was chosen Prince of Servia in 1815. Compelled to abdictate in 1839, he was, in 1858, restored to his former dignity, which was made hereditary in his family. In July 1876, S., excited by the rebellion in Herzegovina, declared war against Turkey, and was joined by Montenegro. The Servians, generally unsuccessful, in spite of the help of numerous Russian volunteers, were totally defeated at Alexinatz in September; in November an armistice was concluded; and in March 1877 the conditions of peace were signed.

Next month war was declared by Russia against Turkey. The sympathies of the Principality were undoubted; but Servia did did not venture again to take the field against Turkey till the fate of the war had been practically decided by the fall of the Turkish stronghold of Plevna in December 1877. The recognition of Servia's independence and an important increase of its territory to the southward, demanded by Russia at the close of the war, were agreed to by the Berlin Congress in 1878.

Language and Literature.—The Servian language, called also the Illyrian, belongs to one of the four great divisions of the Slavic family, and is more nearly allied to Russian than to Polish or Bohemian. It is distinguished from the other members of its division by the predominance of vowels, and consequently by its soft, melodious resonance. This character it owes in part to the influence of the Italian and Greek languages—the former influence being the result of commercial intercourse; the latter, of community of religious belief. The long domination of the Turks has also left unmistakable traces on the Servian tongue; nevertheless, it has on the whole preserved a genuine Slavic character, possessing along with the other members of that family a complete system of declension and conjugation, along with a free syntax. The old classical metres are imitated with facility in it. It is spoken (in the three dialects—Herzegovic, Razavic, and Syrmic) by more than 7,000,000 people, of whom 4,500,000 are under Austrian, 2,500,000 under Turkish, and a few under Russian authority.

After their conversion to Christianity, the Serbs, like the Russians, employed the old Slavic church-language in writing, but in two different styles, one called the church style, and the other the chancery or legal style. The most important monument of the latter is the 'Law-book,' published by King Stephen Dushan, though the oldest extant specimens go back as far as the 11th century. The literary remains of the former are more numerous, and embrace ecclesiastical, devotional and historical works, for the most part composed by the clergy and the monks.

With George Brankovitch (born 1645, died 1711), who wrote a *History of Servia* from the origin of the nation to his own time, this first or medieval period in Servian literature closes. The second or modern period is characterized in its commencement by an effort to raise the spoken language of the Serbs to the dignity of a written language. The consequence was, for a considerable time, the literary language of S. was a chaos of confusion, writers not appearing able to make up their minds which dialect to use, and spoiling their productions by a barbarous mixture of both; and it was not till Vuk Stephanovitch published his *Grammar of the Servian Language* (1814), and his *Songs of the Servian People*, that the victory of the reformers was complete. Since then, the spoken language of S. has also become the language of literature. These Servian popular songs or ballads constitute by far the finest part of Servian literature. The picturesque scenery of the land, and the free solitary life led in the mountain ranges, kindled the imagination of the people, and awoke the voice of song at an early period. Some of the ballads—now so widely known throughout Christendom by means of translation—go back to a period anterior to the appearance of the Turks in Europe. In a wonderful manner, they combine the rude strength, spirit, and naïveté characteristics of the ballad everywhere, with oriental fire and Greek plasticity. They are invariably unrhimed, but preserve at the same time a rhythmic measure. See Kapper's *Volkslieder der Serbein* (2 vols. Leip. 1852); and Bowring's *Servian Popular Poetry* (Lond. 1827), and Owen Meredith's *Serbske Pesme* (Lond. 1861); the last, however, a book of doubtful honesty. Among the poets who acquired distinction in the first part of the century, and have employed the vernacular, the most important is Lucyan Muschiki (died 1837), Archbishop of Carlovitz, whose *Poems* appeared at Pesth in 1838. Of recent or living Servian poets, the most gifted are Branko Raditshevitz and Jovan Ilitz. As yet, science has made little progress. In another branch of the Servian people—the so-called Illyrians, especially the Dalmatians, who profess the Roman Catholic faith—literature received an earlier and more artistic development than among the Serbs of the Greek Church.

In the 12th c., a priest of Ducla (Dioclea) wrote a Chronicle, first in Slavic, and afterwards in Latin, fragments of which are still extant. During the 13th and 14th centuries, devotional works in the vernacular were numerous, and towards the end of the 15th c. the republic of Ragusa (Slav. Dubrovnik) obtained the name of the 'Illyrian Athens' on account of the brilliant success with which it cultivated literature, art, and science. Epic, lyric, and dramatic poetry, history and jurisprudence, are all admirably represented. The list of its poets is particularly large. Towards the end of the 18th c., literary activity abated among the southern or Illyrian Serbs, but at the same time began to increase in the north, especially in Croatia and Hungary.—See Ristitz, *Ueber die Serb. Literatur* (Berl. 1853), and, in English, Talvi's *Historical View of the Languages and Literature of the Slavic Nations* (New York, 1850); as also Schafarik's *Geschichte der Südslawischen Literatur* (1864), and Novakovitz's *Istorija srpske Knijzevnosti* (Belgrade, 1867). There are numerous grammars and dictionaries.

SERVICE (*Pyrus domestica* [see PYRUS], the *Sorbus domestica* of many botanists), a tree of fifty or sixty feet in height, with pinnated leaves, which are downy beneath, and their leaflets serrated upwards, and small white flowers in panicles, a rare native of England, found also in various parts of Europe, the west of Asia, and the north of Africa, and cultivated for its fruit, which is obovate, and about an inch in length, resembling a small pear, but pleasant only in a doughy and over-ripened state, like the medlar. It is more cultivated in Italy, Germany, and France than in Britain. The tree is of very slow growth, and attains a great age.

The timber is valuable, very heavy, fine-grained, and susceptible of a high polish, possessing a strength and durability which particularly adapt it for some purposes of the machine-maker. It is

used also for making mathematical rulers, &c.—The name WILD SERVICE is given to an allied species, *Pyrus torminalis*, also called the SORB, a common native of the middle and south of England, and of the middle and south of Europe—a small tree, with a spotted fruit, considerably larger than that of the common hawthorn, which, like the fruit of the true service, becomes mellowed and pleasant by keeping, and is regularly brought to the market in many parts of Europe. Large quantities are brought to London from Hertfordshire. The dried fruit is used in some places as a cure for diarrhœa. The wood is highly valued. It is hard and tough, yellowish-white, with browhish-red and dark-brown streaks.

Wild Service (*Pyrus torminalis*).
a, fruit; *b*, flowers.

SERVICE AND WORK is the name usually given to an action brought by a workman who has done work to order, or on request, or has been engaged for a specific time.

SERVICE OF HEIRS is a proceeding in the law of Scotland by which the heir of a deceased owner of land has his relationship recognized and declared, and his feudal title to the land completed.

SE'RVITUDE, a name borrowed by the law of Scotland from the Roman law, to denote that kind of right or interest which a person often has in land of which he is not the owner, as a right to cut turf, &c. Servitudes are divided into predial and personal. A predial servitude is a right constituted over one subject or tenement by the owner of another subject or tenement; while a personal servitude is constituted over a subject in favor of a person without reference to possession of property. The only kind of personal servitude is life-rent or usufruct. The predial servitudes are those usually referred to under the head of servitude. Such a servitude being constituted in respect of the ownership of property, passes to third parties with such ownership. The tenement over which the servitude exists is called the servient tenement, and the other is called the dominant tenement. Predial servitudes are again subdivided into rural and urban, according as they affect land or houses. The usual rural servitudes are those of passage or road, pasture, feal and divot, aqueduct, thirlage, &c. Passage or road is the right which a person has to walk or drive to his house over another's land. Pasture is the right to send cattle to graze on another's lands. Feal and divot is the right to cut turfs or peats on another's land. Aqueduct is the right to have a stream of water conveyed through another's lands. Thirlage is the right to have other people's corn sent to one's mill to be ground. The urban servitudes are stillicide, light, *oneris ferendi*, &c. Stillicide is the right to have the rain from one's roof drop on another's land or house. Light is the right to prevent another from building so as to obstruct the windows of one's house. *Oneris ferendi* is the right of the owner of the flat above to have his flat supported by the flat beneath.

SE'RVIUS TU'LLIUS. See ROME.

SE'RVUS SERVO'RUM DE'I (Lat. Servant of the Servants of God), a form of subscription adopted by the Roman pontiffs from the days of Pope Gregory the Great, by whom, according to his biographer, Paul the Deacon, it was assumed as a practical rebuke of the ambitious assumption of the title of 'Ecumenical (or universal) Patriarch,' by John, surnamed Nesteutes, or the Faster, the contemporary Patriarch of Constantinople. Gregory is said, indeed, by Paul to have been the first Christian bishop by whom this humble form was employed. This, however, is certainly a mistake, the same designation having been frequently used by bishops before the time of Gregory. Gregory was probably the first of the bishops of Rome to adopt it as a distinctive title. It is found in all the letters of Gregory which Venerable Bede has preserved in his History.

SE'SAMOID BONES are small bones met with in the substance of the tendons of muscles in the neighborhood of certain joints. They derive their name from the Gr. *sesame*, a kind of Indian grain, which they were supposed to resemble. In the human subject, the patella is the best example; and beside it, they are commonly met with only on the palmar aspect of the joint which unites the metacarpal bone with the first phalanx, and in the corresponding position in the toe, there being two in each position, and their object being to increase the leverage of the short flexor muscles of the thumb and toe. They are much more abundant in the great majority of mammals than they are in man.

SE'SAMUM, a genus of plants of the natural order *Bignoniaceæ*, suborder *Pedaliaceæ*, a suborder characterized by wingless seeds, and placentæ with woody lobes attached to the inner wall of the fruit. The calyx of S. is five-parted; the corolla bell-shaped and five-parted, the lowest lobe prolonged; the stamens four, two longer than the others, and a rudimentary fifth stamen; the capsule is oblong, almost four-celled, two-valved, many-seeded. The species are natives of India and Africa, and are annual plants, covered with hairs, their flowers solitary in the axils of the leaves, on very short stalks. They are so similar as to be sometimes reckoned mere varieties of one species, *S. Indicum*. The sweet oleaginous seeds are used in some countries, as in Central Africa, for making a kind of hasty-pudding. In Egypt, they are eaten, strewed on cakes. The bland fixed oil of S., obtained from the seeds by expression, is used as an article of food, and for medicinal purposes, like olive oil. It keeps long without becoming rancid. It is much used by the women of Egypt as a cosmetic. For the sake, chiefly of its oil, S. is much cultivated in India, China, Japan, and in many tropical and subtropical countries, and has been cultivated from very ancient times. It is too tender for the climate of Britain. The oil-cake, mixed with honey and preserved citron, is an oriental luxury. The leaves of S. abound in a gummy substance, which they readily impart to water, making a rich bland mucilage, which is used in the southern parts of the United States as a demulcent drink. S. is sometimes called *Tilseed*.

SESBA'NIA. See DHUNCHEE.

S'ESHA is, in Hindu Mythology, the great king of the serpent race, on which Vishn'u reclines on the primeval waters. He has a thousand heads, which also serve as a canopy to Vishn'u; and he upolds the world, which rests on one of his heads. His crest is ornamented with jewels. Coiled up, S. is the emblem of eternity. He is often also called *Vâsuki* or *Ananta*, the eternal.

SESO'STRIS, the Greek name of a celebrated Egyptain monarch, who is supposed to have conquered all Asia and Ethiopia. His name has passed into the series of those conquerors who have almost achieved universal empire. According to the Greek legendary history, when S. mounted the throne of Egypt, he began his scheme of conquest, first dividing Egypt itself into 36 nomes, placing his brother as regent, and laying on him injunctions not to assume the diadem, or interfere with the royal harem. S. then marched at the head of a large army, and invaded Libya, Arabia, Asia, penetrating further east than Darius. Advancing through Asia Minor, he invaded Europe, and subdued Thrace and Scythia, leaving a colony at Colchis on his return. In the south, he subdued Ethiopia, and placing a fleet on the Red Sea, conquered the adjacent isles, and extended his dominions to India itself. On his return to Egypt from his northern campaigns, his brother, who had disobeyed his instructions, endeavored to destroy him, by inviting him to a banquet at Daphnæ, and treacherously attempting to burn him and his whole family by firing the house. S. threw two of his children into the fire, and making a bridge of their burning bodies, escaped. S., in his triumphs, dragged his captives attached to the wheels of his chariot. The captives were employed on the public works, the enlargement of the Hephæsteum at Memphis (q. v.), and other temples, and in the construction of canals and mounds. Memorials of his reign, it was said, were left as steles or tablets in the conquered countries; and Herodotus saw some in Palestine, which are supposed to be the tablets of Ramesses II. (see RAMESSES), still existing in the pass of Nahr-el-Kelb, or the Lycus, and the sculptured rock at Nymphi, near Smyrna. S. is said to have grown infirm and blind after a reign of 33 years, and to have ended his days by his own hand.

Not only does the greatest confusion and difficulty about identifying this monarch exist among modern, but also in the classical authors. Herodotus places his reign long before that of Cheops of the 4th dynasty. Dicæarchus makes him rule 3712 B.C., and is followed by Aristotle and other authors. Bunsen supposes that there were more than one monarch of this name, and that one was Tosorthos, of the 3d dynasty; another, Sesortesen II., of the 12th dynasty. Lepsius conjectures that he is the Sethos I. and Ramesses II. of the 19th dynasty. But the exploits of Sesostris seem to be a conglomeration of the conquests of the kings of the 18th and 19th dynasty, especially the Thothmes and Ramesses

(q. v.), who extended the empire of Egypt far to the west and east. No one monarch of the Egyptian monarchy can represent Sesostris.—Herodotus, ii. c. 102; Diodorus, i. c. 55—57; Val. Flaccus, v. 419; Strabo, xvi.; Wilkinson, *Mann and Cust.* i. 99—106; ii. 70; iii. 190; Lepsius, *Einleit.* s. 278; Bunsen, *Aegyptens Stelle*, book ii. 85, 86, 312—324.

SESQUIA'LTERA, one of the compound stops of the organ, composed of either five, four, three, or two ranks of open metal-pipes tuned in thirds, fifths, and octaves to the diapason.

SE'SSA, a city of Southern Italy, province of Caserta, about 38 miles north-north-west of Naples. Pop. (1872) 6138. It has a fine cathedral, a theological seminay and colleges. There are manufactories of woollen cloth. The neighboring soil is fertile. S. is a very ancient city; it was the capital city of the Aruncii, was afterwards colonized by the Romans in 314 A. U. C., and was very flourishing under the Roman empire. It was raised to a duchy in the middle ages.

SESSION, COURT OF. See COURT OF SESSION.

SESSIONS. See JUSTICE OF THE PEACE, QUARTER SESSIONS.

SESTE'RTIUS, a Roman coin, was the fourth part of the *Denarius* (q. v.), and thus contained at first 2½ *asses* or *libræ*. The name is an abbreviation of the Latin *semis-tertius*, which was their mode of expressing 2½; and their custom was, to derive the names of all their coins from the foundation of their money-system, the *As* (q. v.). The symbols for it were indifferently HS or IIS, the former being only a modification of the latter, which expresses two units, and S for the additional half-unit (*semis*). In the Latin classics, the phrase *sestertius-mummus*, or merely *mummus*, is frequently employed to denote this coin. When the *Denarius* (q. v.) was made to contain 16 *asses*, the relation between it and the sestertius was preserved, and the latter from that time contained 4 *asses*, though the name, which was now no longer significant, was preserved. Up till the name of Augustus, when the relation of the denarius to the *as* was changed, the sestertius was worth 2 pence ¼ farthing sterling, but after this period it was reduced to 1 penny 3¼ farthings sterling. The sum of 1000 sestertii was called *sestertium* (after Augustus, = £7, 16*s.* 3*d.*), which was the 'money of account' (never a 'coin') used in the reckoning of large sums of money.

SE'STRI LEVA'NTÉ, a seaport of North Italy, 26 miles east-south-east of Genoa. It is situated on a little bay near the mouth of the Gromolo, and has five foreign consulates. Its Church of the Nativity has some valuable paintings. Pop. 2300.

SE'STRI PONE'NTÉ, a town of North Italy, 4 miles west of Genoa, stands on the high-road which runs along the sea-coast. There is a large government factory of tobacco. Pop. 9500.

SETA'RIA. See MILLET.

SETHE. See COAL-FISH.

SE'THITES, the name given to an obscure Gnostic sect of the 2d c., allied to the Ophites, or worshipers of the serpent; they belonged to that class of religionists who, in evolving what they regarded as their system, approached paganism. Accepting the Christian mode of thought and its terminology, they utterly disregarded the great facts of Scripture history, maintaining that Seth reappeared in the person of the Messiah, and affirming that they possessed books written by him.—See Neander's *Kirchengeschichte* (Bohn's translation, vol. ii. page 115).

SE'TON, in Surgery, is an artificially produced sinus or channel, through which some substance—e. g., a skein of cotton or silk, or a long flat piece of india-rubber or gutta-percha—is passed so as to excite suppuration, and to keep the artificially formed openings patent. (The term is, however, very often employed to designate the inserted material.) Setons are established in the subcutaneous tissue of the body (1) as counter-irritants, or (2) to act as a drain on the system at large, or (3) to excite inflammation and adhesion. For the purposes of counter-irritation, setons are usually inserted in the neighborhood of the affected parts; but when intended to act as a drain on the system at large—e. g., in threatened head-affections—the nape of the neck is the part always selected. The operation is very simple. A longitudinal fold of skin over the spines of the cervical vertebræ is raised by the fingers from the deeper structures, and is transfixed by the seton-needle rather obliquely, so that one of the openings shall be rather more dependent than the other. The needle must pass somewhat deeply through the subcutaneous tissue, as, if it passed immediately beneath the skin, the latter would probably slough over the whole track of the wound. The inserted material should be smeared with oil, and may be allowed to remain undisturbed for four or five days, till there is a free discharge of matter, after which a fresh portion should be drawn daily through the wound.

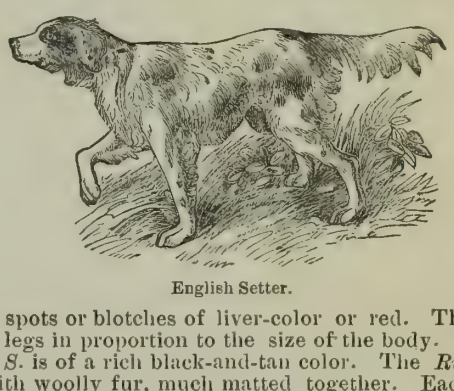
For the purpose of exciting local inflammation and adhesion (which is a result of the inflammation), setons are employed in the treatment of hydrocele, enlarged bursæ, ranula, bronchocele ununited fractures, &c. In the two last-named cases, their use is, however, not unattended by danger.

The word *seton* is derived from the Latin *seta*, a hair, because hairs were originally employed as the inserted material. Indeed, at the present day, it is the custom of many of the nomadic tribes of Central Asia to insert a hair into the heels of their prisoners, which lames them to such an extent as to prevent their escape.

SETT, in Scotch Law, was used to denote the constitution of a burgh, whether founded on immemorial usage or modelled by the Convention of Royal Burghs (q. v.).

SE'TTÉ COMMU'NI DI VICE'NZA, a district consisting of seven communes or parishes in the neighborhood of Vicenza, the language and population of which are plainly Teutonic, and have maintained themselves pure and unmixed in the midst of a Latin people from the days of the Roman republic. The inhabitants are believed by antiquaries to be descendants of the remnant of the Cimbrian army which was defeated with great slaughter by Marius, and are supposed to have escaped to the mountains, and there fixed a permanent settlement. Their language is perfectly intelligible to any German scholar. Specimens of this dialect, and of a similarly isolated Teutonic dialect which is found near Verona, are given by Adelung in the *Mithridates*, ii. p. 215.

SETTER, a king of dog which derives its name from its habit of *setting* or crouching when it perceives the scent of game, instead of standing, like the pointer. Setters, however, are now trained to adopt the pointer's mode of standing whilst marking game. The S. was originally used to assist in the capture of game by the net. It is supposed to derive its origin from a mixture of the pointer and the spaniel. It is larger than the spaniel; its hair is less smooth than that of the pointer, and has more of the waved character of that of the spaniel, to which there is a resemblance also in the ears. The tail is bushy. There are several breeds of the setter. The general color of the *English S.* is a white ground,



English Setter.

with large spots or blotches of liver-color or red. The *Irish S.* has larger legs in proportion to the size of the body. The *Scotch* or *Gordon S.* is of a rich black-and-tan color. The *Russian S.* is covered with woolly fur, much matted together. Each of these breeds has its peculiar merits. All setters have the soles of the feet well covered with hair, so that they can bear hard work on rough ground. They soon become exhausted, however, unless they have access to water. The S. is much employed by sportsmen. It is one of the most affectionate, gentle, and intelligent of dogs.

SETTLE, ELKANAH, was born at Dunstable, in the year 1648. He completed his education at Trinity College, Oxford, which he left without taking a degree, and repaired to London, to seek his subsistence by literature. In 1671, he made something of a hit by the production of his tragedy of *Cambyses;* and the Earl of Rochester and others, wishing to annoy and insult the great Dryden, loudly hailed in him the superior genius of the two. Through the influence of Rochester, to his next tragedy, *The Empress of Morocco*, the unwonted honor was accorded of being played at Whitehall by the lords and ladies of the court, and in this way a great run was secured for it when it came before the general public. In the insolence of success, the author printed along with it a Preface, in which Dryden was severely assailed. Solely in virtue of the quarrel thus engendered is S. now remembered. In his great satire, *Absalom and Achitophel*, Dryden scourged him with his scorn, so that in some sort he survives for us, if only as a shrieking ghost. Having no real strength of talent, he speedily relapsed into obscurity. The post of poet-laureate for the city he had obtained and he continued to retain. By writing in this capacity verses for city pageants and festivities, and producing pieces to be acted in the booths of Bartholomew Fair, the sometime rival of Dryden was fain to eke out a wretched subsistence. In his destitute age, he was admitted to the Charter-house, where in 1723 he died, his works having predeceased him.

SETTLED ESTATE, in English Law, means an estate held by some tenant for life, under conditions more or less strict, defined by the deed.

SE'TTLEMENT, in English Law, is used in two senses. In one case, it means the mode of securing property on married parties, so as to regulate the succession in the event of the death of either, or it may regulate the succession of parties not married. In poor-law matters, it means that kind of right which a pauper has to support by the parish by reason of his being born there, or of his renting a tenement or acquiring estate, &c. It often happens that a person becomes chargeable, that is, is entitled to be relieved by a parish in which he has no settlement, and the relieving parish can forthwith remove him to his parish of settlement. See REMOVAL OF PAUPERS.—In Scotland, settlement, besides the above meanings, also means the general will or disposition by which one regulates the disposition of his property after death.

SETU'BAL (frequently and erroneously called by the English ST. UBE'S) is an important seaport city of Portugal, in the province of Estremadura, 20 miles south-east of Lisbon. It stands on the north side of the Bay of Setubal, which forms a magnificent harbor, though the entrance to it is obstructed by sandbanks. The harbor is furnished with a light-house and with broad and handsome quays, and is protected by five forts; but the valley in which the town itself stands is completely commanded by the heights in the vicinity. The town owes its importance chiefly to its trade in the muscadel and white wines, in sea-salt, oranges, lemons, and cork bark, but fishing is also carried on with considerable activity. S. is the old Roman *Cetobriga*. In 1755, it was visited by an earthquake, from which it suffered severely. Pop. 17,000.

SEVEN: frequently used as a mystical and symbolical number in the Bible, as well as among the principal nations of antiquity (the Persians, Indians, Egyptians, Greeks, Romans, &c.). The reason for the preference of this number for sacred use has been found in its consisting of *three*—the number of the sides of a triangle—and *four*—the sides of a square, these being the simplest rectilineal figures :—or in other equally vague circumstances. The real reason, however, seems to be astronomical, or rather astrological, viz., the observation of the seven planets and the phases of the moon—changing every seventh day. (See WEEK.) As instances of the use of this number in the Old Testament, we find the Creation completed in seven days, wherefore the seventh day was kept sacred; every seventh year was Sabbatical, and the seven times seventh year ushered in the Jobel-year. The three *Regalim*, or pilgrim festivals (Passah, Festival of Weeks and Tabernacles), lasted seven days; and between the first and second of these Feasts were counted seven weeks. The first day of the seventh month was a 'Holy Convocation.' The Levitical purifications lasted seven days, and the same space of time was allotted to the celebration of weddings and the mourning for the dead. In innumerable instances in the Old Testament and later Jewish writings, the number is used as a kind of round number. In the New Testament we have the churches, candlesticks, stars, trumpets, spirits, all to the number of seven; and the seven horns, and seven eyes of the Lamb. The same number appears again either divided into half (3½ years, Rev. xiii. 5, xi. 3, xii. 6, &c.), or multiplied by ten—seventy Israelites go to Egypt, the exile lasts seventy years, there are seventy elders, and at a later period there are supposed to be seventy languages and seventy nations upon earth.

To go back to the earlier documents, we find in a similar way the dove sent out the second time seven days after her first mission, Pharaoh's dream shows him twice seven kine, twice seven ears of corn, &c. Among the Greeks the seven was sacred to Apollo and to Dionysos, who, according to Orphic legends, was torn into seven pieces; and it was particularly sacred in Eubœa, where the number was found to pervade, as it were, almost every sacred, private, or domestic relation. On the many ancient speculations which connected the number seven with the human body and the phases of its gradual development and formation, its critical periods of sicknesses—partly still extant as superstitious notions—we cannot here dwell. The Pythagoreans made much of this number, giving it the name of Athene, Hermes, Hephaistos, Heracles, the Virgin unbegotten and unbegetting (i. e., not to be obtained by multiplication), Dionysos, Rex, &c. The 'seven sacraments,' the 'seven Free Arts,' the 'seven wise men,' and many more instances, prove the importance attached to this number in the eyes not only of ancient but even of our own times. That it played an immense part in the superstitions of the middle ages need hardly be added.

SEVEN DOLOURS OF THE BLESSED VIRGIN MARY, FEAST OF, a modern festival of the Roman Catholic Church, which, although bearing the name of devotion to the Virgin Mary, in reality regards those incidents in the life and passion of Christ with which his mother is most closely associated. This festival is celebrated on the Friday preceding Palm Sunday (q. v.). The 'dolours' or sorrows of the Blessed Virgin have long been a favorite theme of Roman Catholic devotion, of which the pathetic *Stabat Mater Dolorosa* is the best known and most popular expression; and the festival of the Seven Dolours is intended to individualize the incidents of her sorrows, and to present them for meditation. The seven incidents referred to under the title of 'dolours' are: 1. The prediction of Simeon (Luke ii. 34); 2. The flight into Egypt; 3. The loss of Jesus in Jerusalem; 4. The sight of Jesus bearing his cross towards Calvary; 5. The sight of Jesus upon the cross; 6. The piercing of his side with the lance; 7. His burial. This festival was instituted by Pope Benedict XIII. in 1725.

SEVEN SLEEPERS, the heroes of a celebrated legend, which is first related by Gregory of Tours in the close of the 6th c. (*De Gloria Martyrum*, c. 95), but the date of which is assigned to the 3d c., and to the persecution of the Christians under Decius. According to the narrative, during the flight of the Christians from the persecution, seven Christians of Ephesus took refuge in a cave near the city, where they were discovered by their pursuers, who walled up the entrance, in order to starve them to death. A miracle, however, was interposed on their behalf: they fell into a preternatural sleep, in which they lay for nearly 200 years. The concealment is supposed to have taken place in 250 or 251; and it was not till the reign of Theodosius, 447, that they were reanimated. On awaking, they imagined that their sleep had been but of a single night; and on one of the party (supposing the persecution still in progress) going into the city to purchase provisions privately, he was amazed to find erected in triumph on the churches and other buildings, a cross, which, as it seemed, but a few hours before, he had seen the object of contempt and blasphemy. When their wonderful history became known, they were conducted in triumphant procession into the city of Ephesus; but they all died at the same moment, as if by one common and mysterious destiny. The same legend reappears with variations at later periods of Christian history.

SEVENTH-DAY BAPTISTS. See SABBATH.

SEVEN WISE MASTERS is the title of a medieval collection of novels, important both from its contents and its wide-spread popularity. The idea of the work is as follows: A certain prince's son, instructed in all kinds of wisdom by seven sages, finds, from an examination of the stars, on his return to his father's court, that he is in danger of losing his life, if he speaks a word within seven days. His stepmother, whose allurements he had repelled, endeavored in revenge to persuade his father to put him to death, and each day related an artfully constructed story, with the view of furthering her wicked purpose, but its effect was daily neutralized by a rival narrative told by each of the sages. At last, on the expiry of the seven days, the prince himself was enabled to disclose the base designs of his stepmother. —The work is undoubtedly of oriental origin, yet neither the period when it was composed, nor how far it spread through the East, can be ascertained with sufficient accuracy. According to Masudi, it existed in Arabic as a translation from Indian sources before the 10th c., but none of the extant Arabic versions go back so far. Nearest to the original form appears to stand the *Eight Nights* of Nakhschebi, a Persian adaptation of the Indian *Tutiname* (Brockhaus, Leip. 1845). It passed into the literature of Western Europe in the 11th or 12th c., through the medium of two redactions, a Hebrew and a Greek, the latter by Andreopulos, under the title of *Syntipas* (see *Das Buch von den sieben weisen Meistern*, translated from the Hebrew and Greek by H. Sengelmann, Halle, 1842; *Syntipas* being republished by Boissonade, Paris, 1828). The work was disseminated through Christendom; sometimes in a complete form; sometimes only particular novels were reproduced, under all sorts of names, and with all sorts of modifications; sometimes in verse, sometimes in prose. Latin versions began to appear about the beginning of the 13th c., and Keller has published a French metrical one, from a MS. of 1284 (*Li Romans des Sept Sages*, Tüb. 1836), and Henry Weber an English metrical one (third vol. of the *Metrical Romances*, Edin. 1810). There are several German versions, dating from the 14th century. In the 15th c., a popular German chap-book, *Von den sieben weisen Meistern*, was frequently reprinted (the first edition is dated Augsb. 1473), and is included by Simrock in his collection of German *Volksbücher*.

SEVEN WISE MEN, the collective designation of a number of Greek sages, who lived about 620—548 B.C., and devoted themselves to the cultivation of practical wisdom. Their moral and social experience was embodied in brief aphorisms, sometimes expressed in verse, sometimes in prose. The names of the Seven, as usually given, are Solon (q. v.), Thales (q. v.), Pittacus (q. v.), Bias (q. v.), Chilon, Cleobulus, and Periander of Corinth; but there is not absolute unanimity among the ancients either as regards the names, the number, the history, or the sayings of these famous sages. The fragments of wisdom attributed to them which have come down to us are to be found in Orelli's *Opuscula Græcorum Veterum, Sententiosa et Moralia* (Leip. 1819), and have been trans-

lated into German by Dilthey in his *Fragmente der sieben Weisen* (Darmstadt, 1835).

SEVEN WONDERS OF THE WORLD were, in ancient times, reckoned to be the Pyramids of Egypt, the Hanging Gardens of Semiramis at Babylon, the Temple of Diana at Ephesus, the Statue of Jupiter at Athens by Phidias, the Mausoleum (q. v.), the Colossus (q. v.) at Rhodes, and the Pharos of Alexandria. This cycle of seven wonders originated among the Greeks after the time of Alexander the Great, and they were described in a special work by Philo of Byzantium, which has been edited by Orelli.

SEVEN YEARS' WAR, THE, was the third, last, and by far the longest (1756—1763) and most terrible of the contests for the possession of Silesia (q. v.). During the two former wars, the Empress Maria Theresa had plenty of other work on hand in maintaining her claims to the Austrian dominions (see SUCCESSION, WAR OF AUSTRIAN) to offer any very effective resistance to the aggression of Frederick the Great of Prussia; but after emerging triumphantly from this contest, she took advantage of the circumstance that the king of Prussia was on bad terms with all the chief continental powers except Turkey and Spain, to renew the struggle for Silesia, which had been snatched from her at the moment of her greatest straits. She found the Czarina Elizabeth, the King of Poland and Elector of Saxony, and Louis XV. of France (or rather Madame de Pompadour), ready to enter into an offensive and defensive treaty with her.

On the other hand, Britain (then at war with France), engaged to assist Prussia with an army in Hanover, and with subsidies when necessary. Resolving to anticipate his enemies, and secure a safe basis for future operations, Frederick made a sudden advance (August, 1756) on Dresden with 60,000 men, took possession of the country, which he governed from this time with slight intervals to the end of the war, and cooped up the Saxon army 18,000 strong, between Pirna and Königstein. On the Austrians, under Browne, advancing to relieve their allies, they were met by Frederick at Lobositz (October 1), and after an indecisive contest, were obliged to retreat. The Saxons then surrendered (October 14), and were mostly incorporated with the Prussian army, which went into winter-quarters in Saxony and Silesia.—The *second campaign* (1757) began under more favorable auspices for the Austrian coalition, as the rapid action of Frederick had taken it somewhat by surprise in the preceding autumn; besides, Sweden (subsidized by France) became a fourth in the coalition, in order to recover Pomerania, and the German Reich or Empire raised an army, 33,000 strong, to assist Austria. A combined attack was now made by a French army (100,000) on Hanover; another French army (30,000) on Hesse-Cassel (an ally of Prussia), with a view to reach Saxony; an Austrian army from Bohemia on Saxony and another on Silesia, both of them at first united under Marshal Daun, but latterly (1760) separated, under Daun and Loudon; the Russians (100,000) on the east and north-east; and the Swedes (22,000) in Pomerania; while the imperial army sometimes joined the southern French, and sometimes the west Austrian armies. To oppose these armies, numbering in all 430,000, Frederick had the combined British-Hanoverian-Hessian army (60,000) in Hanover, and a Prussian army of 200,000 strong, which was distributed, as need required, over the various points attacked; but he relied much on the rapidity of his movements, and the harmonious completeness of his plans.

In April, Frederick, leaving a corps of 24,000 under Lewald to resist the Swedes and Russians, invaded Bohemia, drove in the advanced corps of the Austrians upon their main army, which he then completely routed at Prague (May 6), with a loss on his side of 18,000, and of 19,000 on the part of the Austrians. Marshals Schwerin (Prussian) and Browne (Austrian) fell in this conflict. Frederick immediately invested Prague, to which Prince Charles of Lorraine, with 46,000 men, had retreated; but Daun, who advanced from Moravia to its relief, inflicted on the Prussians a crushing defeat at Kolin (June 18), and forced them to retire from Bohemia. The north French army had meanwhile, under Marshal d'Estrees, advanced into Hanover, defeated the incapable Duke of Cumberland at Hastenbeck (July 26), and compelled him to capitulate, on condition that the whole of his army, excepting the Hanoverians, should be disbanded. But the British government refused to ratify this shameful treaty, and speedily raised another army of similar composition, which was placed under the command of Duke Ferdinand of Brunswick, an able leader, who again drove back the French, and proved himself so capable to hold them in check, that Frederick ceased to have any apprehensions from this quarter. The south French army under Soubise had also advanced in conjunction with the Imperialists under the Prince of Hildburghausen in the direction of Saxony, but Frederick was not prepared to lose this valuable vantage-ground, and falling upon them at Rossbach (q. v.) (November 5), he put them completely to rout. During his absence, however, the Austrians had broken into Silesia, routed his armies, and compelled them to retire; so, compelled to use the utmost expedition in returning, he collected a small army, defeated a thrice as numerous force of Austrians under Prince Charles of Lorraine at Leuthen (December 5), and recovered Silesia.

On the east, the Russians had appeared in great force, captured Memel, committing the most horrible devastations, and had routed Lewald at Grossjägerndorf (August 30), when the change of Russian policy due to the illness and apparently impending demise of the czarina, caused them to relinquish almost all their conquests; Lewald then attacked and defeated the Swedes, driving them under the walls of Stralsund. Thus closed the second campaign, leaving matters very much as they were at the commencement.—Duke Ferdinand opened the *third campaign* (1758) by driving the French from Lower Saxony, pursued them across the Rhine, and defeated them near Krefeld (June 23); but Contades, the new French commander, having obtained the co-operation of Soubise, compelled him to retrace his steps, till, receiving a reinforcement of 12,000 British, Ferdinand again advanced, throwing Contades between the Rhine and Meuse, and Soubise between the Rhine and Main. Meanwhile, Frederick had not been idle, for after being driven out of Moravia (which he had invaded in spring) by Daun, he marched northwards with a portion of his army to meet the Russians, who, the czarina having recovered, had again invaded Brandenburg, and defeated them in a desperate battle at Zorndorf (August 25), compelling them to retreat into Poland. Frederick's presence was next needed in Saxony, where his brother, Prince Henry, was being hard pressed by Daun with superior forces; but on his arrival the Austrians retreated eastward till October 14, when Daun turned, took Frederick completely by surprise, and gave him a severe defeat at Hochkirch (q. v.), though before the end of the year the Prussians were again in possession of Saxony. Thus passed another campaign with a slight advantage to the Prussians.—The *fourth campaign* (1759) preceded by fruitless attempts at negotiation with France, on the part of Frederick), though signalized by only two great actions, was more unfortunate for Prussia.

The French under Soubise had captured Frankfurt during the winter, and the Duke of Brunswick in attempting to recover it, was defeated at Bergen (April 13), by Broglie (the successor of Soubise), and compelled to resign the whole of Hesse to the French; but later in the year, his signal victory at Minden (August 1) over Contades and Broglie, and that of his relative, the hereditary Prince of Brunswick, at Gohfeld on the same day, recovered most of Westphalia, and drove the southern French beyond the Lahn and Rhine. But in the Saxon district, although Prince Henry invaded Bohemia (April), capturing immense supplies, and cleared Franconia (May) of Austrians and Imperialists, he subsequently evacuated Saxony, which was then occupied by the Imperialists, and Loudon's Austrians advanced into Lusatia. In Silesia, Fouqué gallantly kept the Austrians at bay; and Dohna continued to coop up the Swedes about Stralsund, keeping at the same time an eye on the Russians; but the latter soon gathered in such force that he was compelled to retreat. His successor, Wedel, in attempting to bar their advance, was routed near Züllichau (July 23), and though Frederick hastened to his assistance, attacked them at Kunersdorf (q. v.) (August 12), and had almost gained the day, the arrival of Marshal Loudon with an Austrian force turned the tide, and converted this almost victory into the most signal defeat suffered by the Prussians during the whole war. On the following morning, he could hardly muster 5000 men, but luckily, the Russians showed no inclination to follow up their victory, and by untiring perseverance, the Prussian monarch succeeded in raising another army 28,000 strong. Though it seemed almost impossible for him to prevent the meditated junction of the Russians and Austrians in Brandenburg; yet, by dint of skilful manœuvring, he succeeded in compelling the Russians to retire to Poland; and Prince Henry, by cutting off their supplies, forced the Austrians into Saxony. On November 21, however, he suffered a severe blow in the capture of Finck with 11,000 Prussians, at Maxen in Saxony.

With greatly diminished strength, an exhausted treasury (chiefly supplied by the English subsidy, the taxes of Saxony, and forced contributions on Mecklenburg, Saxony, and Anhalt), a desolated territory incapable of affording either men or supplies, and gloomy forebodings of the final issue, though with unfaltering resolution never to yield, Frederick prepared for his *fifth campaign* (1760).—His army in Prussia, now reduced to 90,000 men, mostly foreigners and raw recruits, was still further diminished by the capture of Fouqué with 8000 men in Silesia, followed by Marshal Loudon's conquest of that province, though the brilliant victory of Liegnitz (August 15) subsequently restored him the north-western division of it; he then joined his brother, Prince Henry, drove the Russians across the Oder, and Daun into Bohemia; but his strength was now becoming glaringly insufficient for the task to which he had set himself; the Russians and Austrians captured and plundered Berlin (October 3); the Swedes came down from the north, and Loudon's Austrians upwards

through Silesia, so that he was now fairly in the toils. But, like a lion in the midst of the hunters, he turned upon his most able and pertinacious adversary, Daun, terribly routed him at Torgau (November 3), in Saxony, then drove Loudon into Glatz, and frightened away the Russians to Poland, and the Swedes to Stralsund. In the west, the fortune of Prussia was in the ascendant, and the French, defeated by Prince Charles of Brunswick at Einsdorf (July 13), and by Duke Ferdinand at Marburg (July 31), were again confined to Hesse.—The *sixth campaign* (1761) on the Rhine commenced still more auspiciously for Frederick, as the French were driven in detail from their strongholds, had their supplies captured, suffered defeat by the Hanoverians at Langensalza (February 14), and by Duke Ferdinand at Villingshausen (July 15), though in the end Broglie and Soubise again gained possession of Hesse. In Silesia, Frederick attempted to bar the progress of the Austrians, so as to prevent their junction with the Russians, and so opposing 130,000 men to his poor remnant of 50,000; but in vain; however, the union was productive of no ill results to him, for scarcity of provisions speedily compelled the Russians to retreat to Poland, after which Loudon retired to Upper Silesia, capturing Schweidnitz with 3700 men on his way.

In Saxony, Prince Henry had to retreat before Daun, and the Prussians were ejected from Pomerania by the Russians and Swedes, all subsidies from Britain stopped by the Earl of Bute after George II.'s death, and the country ravaged in all directions, so that things were now in a desperate condition, and Prussia almost at its last gasp. Frederick's assailants had cooped him up within Southern Brandenburg and North-western Silesia, and though as resolute as ever to figlrt on, it seemed as if another campaign must bring him to final ruin. But the death of the czarina (January 5, 1762) converted the most powerful of his enemies into a fast friend; Sweden, which had suffered uninterrupted reverses during the whole war, also retired from the alliance—and the *seventh campaign* (1762) commenced on equal terms, as Austria and France were almost as much exhausted as Prussia. On the refusal of Austria to submit her cause to arbitration, the Czar Peter III. joined his army to that of Frederick; but his successor, Catharine II., ordered the return of the army, though her strict nutrality was of itself an immense benefit. Frederick had now no fears for the result. Nor had he any reason, as subsequent events showed, for on July 21 he drove an Austrian force from its intrenchments at Burkersdorf, and following up his success, routed Daun at Reichenbach (August 16), and took Schweidnitz (October 9); while Prince Henry, by a series of fortunate manœuvres, possessed himself of the passes of the Erzgebirge, and with the valuable aid of Seidlitz, completely overthrew the other Austrian army at Freiberg (October 22); and the two Brunswicks nobly sustained the glory of Prussia at Wilhelmsthal (June 24) and Luternberg (July 23), capturing Cassel, and recovering the whole of Hesse.

France now gave up a contest from which she had gathered nothing but military disgrace, and concluded treaties with Britain and Prussia; while Prussia and Austria agreed to an armistice with regard to Saxony and Silesia, of which the astute Frederick took advantage to send Kleist on a raid through Franconia and Bavaria, which had the effect of withdrawing the minor German states from the coalition. Maria Theresa was now left alone, and sorely against her will, was compelled to conclude the peace of Hubertsburg, 15th February 1763, which finally acknowledged Frederick as the lord of Silesia. This long and desperate conflict made no change in the territorial distribution of Europe, but it increased tenfold the moral power of Prussia, and gave its army a prestige which it retained till the battle of Jena. It cost Europe a million lives, and prostrated the strength of almost all the powers who had engaged in it.—See for a complete account, Carlyle's *History of Frederick the Great*.

SE'VERALLY, in English Law, is the enjoyment by an individual of an estate, in contradistinction to joint (q. v.).

SE'VERN, one of the most important and beautiful, and after the Thames, the largest of the rivers of England, rises from a chalybeate spring on the eastern side of Plinlimmon, about 11 miles west of Llanidloes, in Montgomeryshire, North Wales. Flowing eastward from its source to Llanidloes, to which town it retains its original British name of Hafren, it afterwards flows north-east to the eastern boundary of Montgomeryshire, then east-south-east, past Bridgenorth in Salop, and finally southward through Worcester and Gloucester, in which last it begins to form its estuary. It is navigable for barges to Welshpool in Montgomeryshire, 180 miles from its mouth. Its entire length is 210 miles, and it drains an area of more than 6000 sq. miles.

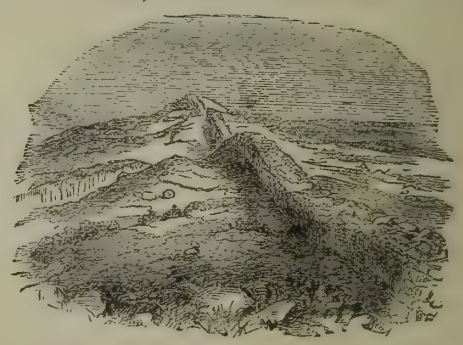
The chief affluents of the S. are the Terne, and the Upper and Lower Avon on the east, and the Teme and Wye on the west. A canal 18½ miles long, and nagivable for vessels of 350 tons, extends from Gloucester to the upper portion of the estuary of the river, and thus materially shortens the navigation of its lower course. The Montgomery Canal extends from Welshpool to Newton, and other canals establish communication between the S. and the Thames, Trent, Mersey, and the other important rivers of the middle districts of England. The *bore*, or tidal wave, which rushes up the S. with a velocity at times of 14 miles an hour, raises the water 9 feet in height at Gloucester, below which embankments have been constructed. The estuary of the S. is, since 1879, spanned by a long railway bridge near Burton Passage, which cost £400,000.

SEVE'RUS, ALEXANDER. See ALEXANDER SEVERUS.

SEVERUS, L. SEPTIMIUS, Roman emperor, was born 11th April 146 A.D., near Leptis Magna, on the north coast of Africa, of a family of equestrian rank; and after receiving an excellent education, removed to Rome, where he became prætor, 178 A.D. He was subsequently commander of a legion in Gaul, and governor of Gallia Lugdunensis, Pannonia, and other provinces. After the murder of Pertinax, he was proclaimed emperor, 193 A.D., at Carnutum, and promptly marched upon Rome, where the puppet Julianus had by purchase obtained the imperial purple. His arrival before Rome was the death-signal for Julianus; and after taking vengeance on the murderers of Pertinax, converting his most formidable rival, Clodius Albinus, into an ally by creating him Cæsar, and distributing an extravagant largess to his soldiers, he marched against Pescennius Niger, and conquered him at Issus, 195 A.D.

A glorious campaign in the East, and a three years' siege, followed by the capture of Byzantium, were followed by a desperate struggle with his jealous rival, Clodius Albinus, whom, after an obstinate conflict at Lyon, in which 150,000 were engaged on each side, he conquered, 197 A.D. The usual games to the degenerate citizens of Rome, and largesses to the troops, followed, after which S. returned to Asia, accompanied by his sons Caracalla and Geta, met with the most brilliant success in the campaign of 198 A.D. against the Parthians, and took and plundered their capital, Ctesiphon. After a war with the Arabs, in which S.'s usual good fortune deserted him, and a general visit to his various eastern dominions, he returned to Rome, 202 A.D., and gratified the popular taste by the exhibition of shows of unparalleled magnificence, also distributing another extravagant largess to the citizens and prætorians. A rebellion in Britain drew him to that country in 208 A.D.; and at the head of an immense army, he marched, it is said, to the extreme north of the island, encountering enormous hardships, to which no less than 50,000 of his soldiers succumbed, and securing no permanent advantages. To secure to some extent the natives of South Britain from the incursions of the Meatæ and Caledonians, S. repaired or partially built the wall which bears his name, and died soon after at York, 4th February 211 A.D. S. was an able vigorous, and just ruler, and a skilful warrior, but totally devoid of high moral sentiment.

SEVERUS, WALL OF, as it has been erroneously called, was a rampart of stone which seems to have been built by the Emperor Hadrian in 120 A.D., between the Tyne and the Solway. On the first subjugation of Britain by the Romans, a line of forts had been constructed by Agricola, extending from the Forth at Edinburgh to the Clyde at Dumbarton. The Emperor Hadrian, on visiting Britain, 120 A.D., threw up for the protection of the Roman province a wall of stone extending across the island, between Tyne and Solway. Twenty years later, Antoninus Pius, whose lieutenant, Lollius Urbicus, had gained fresh advantages over the northern tribes, endeavored to check the inroads of the



A Portion of the Wall of Severus or of Hadrian, near Housestead, Northumberland.

Caledonians by erecting a rampart between the Forth and Clyde, connecting Agricola's line of forts. But after a vain struggle of 60 years, the Romans found it necessary to abandon the whole district between the walls, and in 208 Septimius Severus repaired the wall of Hadrian, which has hence been erroneously called the wall of Severus. Towards the close of the 4th c., Theodosius, for a brief period, reasserted the Roman dominion over the district between the walls of Antonine and Hadrian, which, in honor of

the Emperor Valens, obtained the name of Valentia. But this newly-established province was soon lost, and it was not long before the Romans finally abandoned Britain. Many remains of the Roman walls are yet to be traced. See Bruce's *Roman Wall*, 3d ed. 1867.

SEVIGNÉ, MADAME DE, MARIE DE RABUTIN-CHANTAL, was born at Paris, 6th February 1626. She was the only daughter of the Baron de Chantal, Celse-Benigne de Rabutin, and his wife, Marie de Coulange. She was left early an orphan; and at the age of six the care of her education devolved on her maternal uncle, the Abbé de Coulange, an excellent and amiable man, who most conscientiously acquitted himself of his charge, and for whom through life his niece entertained the tenderest affection. She was carefully instructed in all the knowledge which then appertained to the education of a French gentlewoman; by the eminent scholar Menage she was taught Latin, Italian, and Spanish; and M. Chapelain, another literary notability of the time, also assisted in her culture. At the age of 18 (Aug. 1, 1644), she was married to the Marquis Henri de Sevigné, the representative of an ancient House in Brittany. The union was not a happy one. The marquis was 'a man of wit and pleasure,' of the type of the period; his wit he exhibited by his happy way of squandering his wife's fortune, and he took his pleasure in neglect of her, and addiction to other women. After a time, he was killed in a duel (5th February 1651), by a certain Chevalier d'Albret, his rival in a love-affair. Left with a son and daughter, S. now for a few years retired almost wholly from society, and devoted herself to their education. In 1654, she returned to Paris, where her beauty, her wit, her happy social tact and vivacity, concurred, with the charm of her sweet and kindly nature, to insure her unrivalled success in the brilliant society of the period. Her lovers were legion, and among them were numbered some of the most distinguished men of whom France could then boast, as the Prince de Conti, Turenne, Fouquet the Superintendent of Finance, and others. But they sighed in vain: all offers of marriage she steadily declined; and from any of those lighter ties, there and then most leniently looked on—if not almost considered *comme il faut*—she has left no spot upon her reputation.

For her virtue she must have credit as virtue, and not merely the coldness which simulates it; for she was obviously of a warm, eager, even somewhat impulsive nature. Her numerous and warm friendships, with her absolute devotion to her children, may have sufficed as food of a heart not unlikely, in lack of these, to have craved a more perilous diet. Her affection for her daughter in particular, who in 1669 became Madame de Grignan, was the ruling passion of her life; and to the separation of the mother, over long periods, from 'this infinitely dear child,' the world is indebted for by much the larger moiety of the collection of Letters which has given fame in perpetuity to Madame de Sevigné. Madame de Grignan was one of the most beautiful and accomplished women of her time, and every way worthy of the love thus lavished without stint upon her. If she did not reciprocate its full fervor, *that*, as the shrewd mother well knew, was simply in the nature of the case; and not to have demonstrated in return more rapture than she really felt, ought to count as a point in her favor, rather than reverse-wise as it has been held to do. If it was the one main grief of Madame de S. to be forced to live apart from her daughter, the happiness of dying beside her, may perhaps have a little consoled her for it. In 1696, while on a visit to the Château de Grignan, she was seized with malignant small-pox, and died at the age of 70.

The Letters of Madame de S., on which her fame securely rests, are charming in the *abandon* and easy *naïve* frankness with which they reveal her beautiful nature. They sparkle with French *esprit*, and spontaneous gaiety of heart; and their writer is scarce anywhere quite equalled in the delicate *finesse* with which, in a few careless rapid words, she flings off a scrap of light narrative, dashes in a little graceful picture, or points a dramatic situation. Above all remarkable is the lightly-moved and ever-active sympathy which keeps her exquisitely *en rapport* with the interest of whatever may be passing before her.

SEVI'LLE (Span. *Sevilla*, the *Hispalis* of the Romans), a famous city of Spain, formerly capital of the ancient kingdom, and now of the modern province of the same name, stands on the left bank of the Guadalquivir, 94 miles by railway north-north-east of Cadiz. The city is almost circular in shape, is surrounded by Moorish walls, surmounted with 66 (formerly 166) towers, and pierced with 15 gates, and is five miles, or, including its 10 suburbs, 10 miles in circumference. Held by the Moors for five centuries, and entirely rebuilt by them from the materials of former Roman edifices, S. was long a purely Moorish city, and the old Moorish houses, which age, in this dry climate, has done little to destroy, are still the best houses to be seen. Half of the city still preserves its ancient character; but changes are taking place every year. The narrow tortuous streets that kept out the sun, with their wide spacious mansions, with ample courts and gardens, so perfectly suited to the climate, are giving way to spacious straight streets of small, hot houses, open to the blaze of noon. The cathedral, one of the largest and finest in Spain, is an imposing edifice, of which the solemn and grandiose are the distinctive qualities. It was completed in 1519, is 431 feet long, 315 feet wide, has 7 aisles, and an organ with 5400 pipes. The pavement is in black and white checkered marble. The cathedral is superbly decorated. Its painted windows are among the finest in Spain, and it contains paintings by Murillo, Vargas, the Herreras, &c. Attached to the cathedral is one of the most remarkable towers in the world. It is called the Giralda (i. e., a weathercock in the form of a statue), and is in all 350 feet high. This Moorish tower was built in 1196, and was originally only 250 feet high, the additional 100 feet being the rich filigree belfry added in 1568. The pinnacle is crowned by a female figure in bronze, 14 feet high, and 2800 lbs. in weight, and which veers about with the slightest breeze. From this great tower the *Mueddin* (q. v.) of Mohammedan days called the faithful to prayers. The royal residence, the (*Al-Kasr*, house of Cæsar), contains several noble halls, and much delicate ornamentation, that rivals that of the Alhambra.

The house in which Murillo lived and died is still to be seen here. The finest pictures in S. are to be seen in the cathedral, the Caridad, the Museo, and the University. S. contains 74 churches; but prior to the suppression of monasteries, it contained 140. Besides the university (of four faculties), there are many educational institutions. The city contains upwards of 100 squares. The Fabrica de Tabacos, where tobacco is made into snuff and cigars, employs several thousand hands, mostly females. The Plaza de Toros can accommodate upwards of 12,000 spectators. There is regular communication with Cadiz by river and rail. There are here several royal foundries and factories for arms, and porcelain and iron and machine works. Weaving, soap-making, and other branches of manufacture are carried on. Pop. about 134,000.

The Hispal of the Phœnicians, the Hispalis of the Romans, was corrupted by the Moors into Ishbilliah, of which it is supposed the modern name is a modification. It was a place of great importance in the later period of Roman dominion; became the capital of Southern Spain during the ascendency of the Vandals and the Goths, when it was the scene of two notable church councils (590 A.D. and 619 A.D.); and fell into the hands of the Moors in the 8th c., under whom it rapidly rose to a splendid prosperity, and reckoned 400,000 inhabitants. In 1026, it became the capital of the Moorish kingdom ruled by the Abadides, from whom it passed, in 1091, to the Almoravides, and in 1147, to the Almohades. In 1248, it was taken by Ferdinand III. of Castile, when 300,000 Moors left for Grenada and Africa; and from this time to the removal of the court to Valladolid, in the reign of Charles V., S. was the capital of Spain. The city rose to its climax of prosperity after the discovery of the New World, when it became the residence of princely merchants and the mart of the colonies, but its trade was afterwards transferred to Cadiz. In 1810, it was taken and ravaged by Soult. It capitulated to Espartero in 1843.

SÈVRES, a small town of France, in the dep. of Seine-et-Oise, six miles south-west of Paris, on the Paris and Versailles Railway. It is celebrated for its manufacture of porcelain wares, which are unsurpassed for elegance of design and beauty of painting. Painted glass is also manufactured. The Porcelain Museum, which was destroyed during the war of 1870, contained a large and curious collection of articles in china and earthenware from all parts of the globe. Pop. (1876) 6512.

SÈVRES, DEUX-, an inland dep. in the west of France, between the deps. Vienne on the east and Vendée on the west. Area, 2315 sq. m.; pop. (1881) 350,103. The dep. takes its name from two rivers of the same name, the Sèvre-Niortaise, which flows west into the sea, and the Sèvre-Nantaise, an affluent of the Loire. It is traversed from south-east to north-west by a chain of hills, called in the south-east the Monts du Poitou, and in the north, the Plateau de Gatine. This ridge forms the water-shed between the Loire on the North and the Charente on the south. The climate is generally healthy, and the soil, two-thirds of which is arable, is very fertile. There are numerous iron mines, and good quarries of freestone and marble. The arrondissements are Niort, Bressuire, Melle, and Parthenay. Niort is the capital.

SEW'AGE. It is of the first importance to health for houses, both in the town and in the country, that all filth should be removed from them as speedily as possible, and disposed of in such a manner as to cease to be injurious to mankind. It may be taken as a pretty safe general guide, that all matters which give off a disagreeable smell are dangerous if allowed to remain near our dwellings; nature thus giving us warning of the presence of something that may do us harm. Many people have thought that if, by using certain deodorizing materials, they could either fix this effluvium permanently or for a time, they had surmounted

the difficulty; but this is scarcely half a cure, and a palliative like this is much less advisable than a radical measure of removing the filth by suspension in water, and rendering of it not only innocuous, but beneficial, by incorporating it with the great deodorizer—living vegetation. It seems as if nature had planned all this for us, if we will only follow her teaching.

During the first two or three days after sewage is deposited in water, the smell is unpleasant, but not dangerous to mankind; after that, putrefaction begins, and the gases given off become deleterious. Here, then, is time for removal, and a punishment for neglect. Fevers, gangrene, ophthalmia, and many other diseases, especially among children, are certain to break out and become malignant if the emanations from such filth exist in the air around human habitations. Until within the last 50 years, privy-pits and cesspools prevailed everywhere. In the country, the former were generally placed in the garden attached to the house, and at some distance off, so that there was not much danger attached to them. In the towns, cesspools existed among the houses, but they were very objectionable and dangerous, and constantly neglected. These cesspools were large underground tanks built in brickwork, into which all the sewage from the house was discharged. In them the filth accumulated and putrified until it was periodically removed by manual labor. They acted like an immense brewing vessel, sending up deadly vapors which had no escape, except back into the house among the inhabitants. The cesspools also frequently leaked, and so if any wells were near, poisoned the water. When Bramah invented the water-closet, and a larger supply of water had to be found for towns, the cesspools began to overflow at such a rate, that a general revision of the whole system became necessary; and at the same time, medical men insisted upon the continuous and perfect removal of filth as the only reliable sanitary process of dealing with the matter. A return to the use of cesspools in any form would therefore be a step in the wrong direction, and would lead to disastrous results.

We may divide the subject as follows: 1. The Management of the Sewage of Cottages; 2. Dwelling-houses and Public Buildings in the Country; 3. Towns; and 4. The Utilization of Sewage.

1. *Cottages.*—It is obvious that in the case of single detached cottages, expensive arrangements such as those necessary for water-closets could not be provided, and some simpler plan must be followed.

It is very objectionable to allow either cesspool or privy-pit, if they can be avoided, as they are constantly neglected, and overflow into some stream, or poison the wells and the air. The privy should be placed, wherever that can be managed, on the north or east side, and to the rear of the house, so as not to be between the people and the sun and softest winds. The whole sewage-matter should be received in a square galvanized iron pail underneath a seat, which pail can be removed from the outside, and into which a small quantity of house-ashes should be placed, either daily, or as often as the closet is used. This will quite fix the ammonia. The iron pail must be removed by the cottagers at least once a week, and emptied into their garden. No danger can possibly arise from this, if strictly followed, and all the sewage-matter is placed to its best purpose. The sketch attached

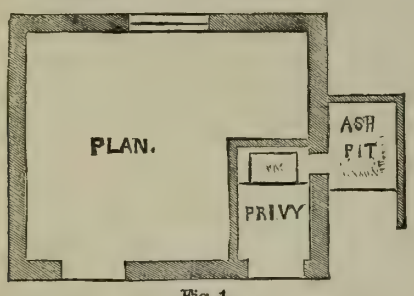


Fig. 1.

(see fig. 1) will show the way of doing this. There has not been found any difficulty in introducing this system among cottagers.

2. *Dwelling-houses and Public Buildings in the Country.*—It would be useless to discuss a dry-earth system like what has been mentioned anywhere but for outhouses attached to cottages; the general feelings of the inhabitants would not tolerate it. We must therefore accept the water-closet as the system universally adopted. In planning the position of water-closets for a house, the first thing to be thought of is, that they shall be if possible on the north or cool side of the house, and upon exterior walls. If they are placed in the interior of the house, it is troublesome to get at the drains when required, and the closets themselves cannot be sufficiently ventilated. If the closet is inside the house, then Bramah's patent with a D trap underneath is the only form that should be used; but if a closet is outside, then a less expensive one with a syphon earthenware trap may be adopted. It is desirable that the closet should be surrounded with brick walls, and, in fact, isolated from all other parts of the house. The window of the closet when inside the house should always reach the ceiling; and a ventilating shaft in the manner shown in the accompanying sketch is desirable where the closet is much used, and the window must be shut occasionally. The ordinary water that passes into the drains leading from any closet—such as is discharged each time that the handle is raised—is not sufficient to sweep out thoroughly all the solid matter from the drain-pipes, and therefore a flushing apparatus at the highest point of all sets of drains is essential, so that a body of water may be allowed to pass down with a rush at least twice or three times a week. It is also desirable that the foul air engendered in the drain-pipes themselves should have some free outlet into the air at some point where it will not be injurious. The gas given off under such circumstances is of a very light character, and has a great tendency to ascend and draw towards heat.

During the greater part of the year, especially since the system has been introduced of heating houses by hot air, the temperature of living-rooms is much higher than the atmosphere outside; a pumping action is exercised upon the drains, or indeed, upon any outlet, for a fresh supply. If, therefore, some safety-valve is not provided, the gas will force an entry either through the traps or some imperfection in the joints of the drains. The sketch, Fig. 3, will show the best plan that has yet been devised both for flushing and ventilating the soil-pipes of water-closets. In constructing

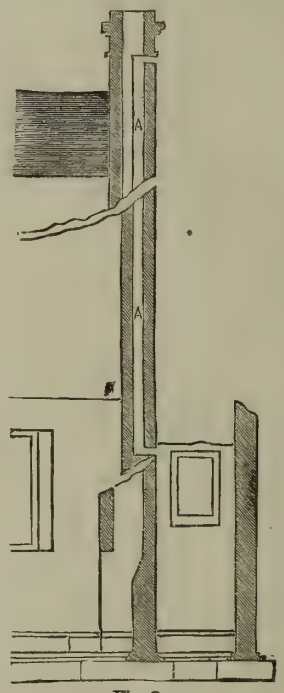

Fig. 2.

AA is the ventilating shaft by which any foul air in the closet itself can pass upwards into the open air. By placing it alongside of a chimney a draught is created which will empty the closet of any effluvium that may be in it.

AA is the ventilating pipe communicating with the soil-pipe; BB is the flushing apparatus for discharging a quantity of water at once.

the drains from houses or large public buildings, it is now a well-decided point that there should be an entirely separate system for the sewage or foul water, apart from that for rain and surface-water. The reasons are many and obvious, but they will be given more appropriately under the head of the Drainage of Towns. Stoneware pipes are the best material to be used for drains, because they are perfectly non-absorbent; but in many cases glazed earthenware will answer very well. The smallest size of pipes of any description that should be used for removing sewage from a house is six inches in diameter. This size, then, may be gradually increased as is necessary, and one of 9 inches will remove the sewage of 500 people. The best fall to be given to a sewage-drain is 1 inch in 10 feet; but all will work well from 1 inch in 5 feet up to 1 inch in 60—provided the flushing arrangements are as they ought to be. In order to keep the drains clean, not less than 10 gallons of water daily should pass down the drain for every person in the house; while anything over 25 gallons is superfluous.

At every 20 yards there should be a pipe laid from which the upper half can be removed, and the interior inspected at any time, and any stoppage remedied without the necessity of breaking the pipes. Greasy water, such as is poured down from the kitchen and scullery of a house, is one of the constant causes of such

stoppages. The fat, as it cools, congeals on the sides of the pipes, and forms a hard cake. The best method of preventing this is to form a small cesspool, into which the kitchen water is poured first, and then to take an overflow through a syphon into the foul drain, so that the liquid only enters, while the fat can be removed by hand from the cesspool. The sewage-matter having been thus all thoroughly removed from the house, a sewage-filter should be built on the principle shown in the sketch, Fig. 4. This was originally the design of the late Prince Consort. The solid and

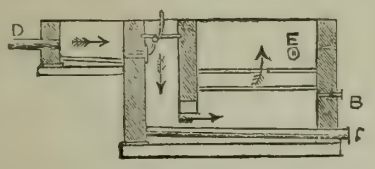

Fig. 4.

The whole sewage matter enters at D; flows in the direction of the arrows; the solid matter becomes arrested in the bottom chamber, while the liquid rises and passes off at E through filtering beds. By opening a tap at B the liquid in the tank or filter can be drawn off, and by opening that at C, the solid matter can be removed. The whole must be water-tight and air-tight. A is a valve for shutting the pipe during cleaning.

liquid matters of the sewage are here mechanically separated, and the former can be removed from time to time—say once in six weeks or two months—while the latter must be passed on for irrigation. It is clearly illegal to pass it into any stream; and it is apt to become a serious nuisance if anything else is done with it. We shall treat of the best method of utilizing this liquid under the fourth head. It is always advisable to get space for all these arrangements on the north and east side of a house, when possible, so as to run no risk of contaminating the air on the south or hot side of a dwelling; and if a belt of trees can be placed between the sewage-filter and the irrigated land and the house, it will also be advantageous.

3. *The Drainage of Towns.*—Until within the last forty years, the only drainage which existed in towns was for the rain-water and surface-water alone, and the inhabitants were strictly watched to prevent their passing any sewage-matter into these drains. The introduction of the water-closet, however, gradually increased the water which overflowed from the old cesspools to such an extent that it was impossible to prevent overflows of this description, and systems of drainage were designed to carry off the whole, both sewage and rain-water. A very composite system of drainage then arose. Generally, the bed of some stream or natural rivulet passing through the town was covered over, and the whole filth passed into that along with the rainfall of the district. This soon was found unsatisfactory, because the flood-waters of the stream were not to be relied on to keep the channel clean, and so the filth remained festering underneath the ground, giving off deadly gases in the midst of the population. The next arrangement which succeeded to that system was to plan large drains for the rain and surface-water, and sewage, and still keeping the idea of the size of the bed of a natural stream before them, engineers thought it necessary to make all the main drains large enough for a man to pass through them, and keep them clean. Seeing the vast quantity of sand and grit that was occasionally washed off the streets, something might be said in defence of this system. Vast numbers of these great main sewers still exist. Into these sewers all the smaller house-drains were to enter, and the surface-water through street-gratings as well. The ordinary water used for domestic purposes, and the occasional rainfalls, were relied upon to flush those large main sewers; but their great size made this an exceedingly difficult and uncertain process, and they, in fact, became only cesspools elongated. In dry weather, the filth was retained in them to such an extent, that after heavy rains, chemical analysis showed that the water which was discharged contained frequently twenty times the amount of human fæcal matter per gallon more than it did in dry weather.

The state of matters, added to the fact that long-continued dry weather was always attended by an increase of deaths from typhus and other fevers, clearly showed that something more must be done. A further step was then taken by sanitary engineers. The idea of men passing up the drains was set aside, and the smallest possible drains were constructed, until these have arrived at such dimensions as an 18 inch main drain for a town of 10,000 inhabitants. The rainfall was still to be relied on to a certain extent for flushing purposes, but a supplementary assistance was to be given at some points by flushing with water from the ordinary regular supply of the town. As these smaller drains were not sufficient to carry off all the surface and rain-water, as well as the sewage, overflow weirs have been provided at certain points, where the excess must go over, and pass away into some other channel. This is the system now most generally adopted, and is better than its predecessors; but it is now decided that it, in its turn, must give way to something better, and the change has commenced. The necessity of dealing with the sewage at the main outfall, and the utilization of it for agricultural fertilization, while, in nine cases out of ten, pumping must be employed to lift the sewage of a town at the discharging point for such a purpose, have gradually forced upon us the conviction that the sewage and household water must be kept quite distinct from the surface-water, subsoil water, and rainfall.

The outfall of the sewage drain, and subsequent disposal of the filth, are in reality the first things to be considered. Hitherto, engineers in general have taken the nearest stream, and polluted it to such an extent, that perpetual lawsuits, nusiances, and diseases have been the result. Fever of the worst class is certain to follow the drinking of water tainted in this manner, and there is scarcely a stream in the interior of the country which has not been injured more or less from this cause.

Again, where the sewage has been emptied into the sea, tide-locked drains are objectionable, and the sewage, when mixed with salt water, generally gives off more stench than ever. We may briefly say that all attempts at deodorization by chemical processes have hitherto failed, and as far as our present knowledge goes, are not to be relied upon. The utilization of the sewage on the fields by irrigation is, therefore, the true solution of the problem, and we must arrive at the simplest, cheapest, most certain, and most perfect system of accomplishing this. When sewage and rainfall all go together in the same drains, as they do in all the older systems, all is uncertainty; while, when the two are separated, rain and surface-water can be discharged at any point into the natural water-courses of the country, and a fixed quantity of sewage, with household and flushing water, would be passed to the main outlet, to be there dealt with. The opponents of this system say that it is too expensive and troublesome to plan; that it is unnecessary, as it is sufficient if engineers provide for the dry-weather flow of the sewage, and use that for irrigation; and that when the overflows come into action in floods, the whole is so much diluted, that no harm is done to any one. The advocates of this double system of drainage have proved the total separation of the two is the most sanitary system, because the street-gratings and rain-water pipes, which at present let down the rain-water into the sewage-drains, act, in fact, as so many ventilating shafts, and discharge the stench in the midst of the inhabitants; while, under a separate system, the sewage-pipe would be entirely sealed up, and only ventilated at such places as could safely be done; that the rain-water as a flushing-power ought to be entirely discarded, as it fails in dry weather, just when it is most wanted; that in wet weather, and winter again, when the discharging of the sewage on to the surface of land is carried out, the great quantity of water sent down through the drains by the present system is agriculturally a serious injury; that when pumping has to be employed for lifting the liquid for irrigation, as it is in most cases, all is uncertainty, and that no machinery can be economical and efficient under such circumstances, and that the planning of the irrigation also becomes difficult to manage, and irregular.

With regard to the expense, it has been proved that, as the rain-water and surface-water can be discharged at the nearest point, all the drains may be much lessened in size; and further, that the flushing-power of the water in the sewage-drains will be much more efficient, while the corresponding lessening of the expense in carrying out the process of utilization will completely compensate any additional outlay that may be incurred in laying the drains in towns. If we take the case, which is a common one, of a population of 10,000 people living upon a square mile, the first-mentioned system, where rain and sewage water go together, would require pumping-machinery, in dry weather, of, say, five horse-power, to lift the liquid; and it would further be necessary, for wet weather, to have in reserve a lifting-power of 150 horses; while, on the separate system, where the sewage alone would have to be dealt with, the five horse-power engine would be regularly and constantly employed, and its work would be almost entirely confined to the daytime, whereas the other must be ready at any time, and for every emergency. The system of sending sewage and rain-water together has been hitherto adopted in all towns; but except in one or two cases where gravitation has been available to utilize the discharge from the drainage, all engineers have failed to prevent the pollution of rivers, and it is obvious that something else must be tried, as that cannot be permitted to go on much longer. The system of separating the sewage and rain-water has been carried out in several large asylums and public buildings, many barracks, the town of Eton, and Windsor Castle—where every consideration, both of expense and sanitary influence, was brought to bear on the subject. Reading, Oxford, and several other towns speedily followed on the same principles, and the results were most satisfactory, and highly economical.

4. *The Utilization of Sewage.*—The whole of the sewage of a house or town having been conveyed away in the manner we have described, the next important step is to know what to do with it.

Above all things, it is desirable to add to the productiveness of the soil, so as to compensate in some degree for the constant supply we are drawing from that source.

The liquid nature of sewage, adopting as we may the ordinary amount of dilution in dry weather at the rate of 25 gallons per head, has been a great obstacle in the way; while also the vast quantities of road-grit, and the great gluts of rain that come down along with the sewage when there is only one system of drains in a town, have upset all arrangements and calculations. Many attempts have been made, especially at Leicester, some years ago, to precipitate all the valuable qualities of the sewage by impregnating the whole with milk of lime; but the process was unremunerative to those who did it, as so much sand was precipitated at the same time, that the product obtained was almost worthless as a manure; while, as the greater part of the ammonia escaped in the water, the discharging of it into any stream was still, strictly speaking, quite illegal. As far as chemical knowledge can guide us, there seems at present to be no hope in this direction.

At Edinburgh, again, and at Croydon, the irrigation of land by gravitation has rendered the process a simple one, because the whole has been poured over the land with many excellent results. These, however, are clearly exceptional cases, and we must look to pumping as being necessary in by far the greater proportion of towns; while for the two places we have mentioned, the results would, in all probability, have been better still if the strength of the sewage had been more concentrated. Agriculturally speaking, any dilution above 25 gallons per head of the population is not desirable, but is injurious and expensive to distribute; while, again, human fæcal matter is too strong to be applied to land, unless diluted in something like ten gallons of water. The Chinese teach us an important lesson in this respect. They place all the solid matter, when they remove it from the towns, in small wells in their fields, and then take a scoopful and mix it in about ten or twelve times its volume of water before they apply it to their crops. If any one attempts utilizing sewage when mixed with rainwater, and has to pump the whole all the year through, he will find himself in endless difficulties.

Presuming, then, that we can arrive at a fixed quantity of 20 gallons per head of the population, or what may be taken as the dry-weather flow of the drainage from a town, the first step is to pass the whole through a strainer, so that all materials may be intercepted which will be likely to interfere with the pumping, or choke the smaller pipes used for irrigation. This is necessary, also, because in its unstrained state we cannot depend upon sewage going down and up again, and so passing over a valley, and the sphere of operations then becomes more limited.

Great part of the solid matter can also be removed by this process, and common house-ashes are the best mixing and deodorizing material to facilitate the stuff being carried away.

A piece of land should then be sought out, with a slope, if possible, of one foot in 30 at least, and the filtered liquid, which will be full of strength, conveyed either by pumping or gravitation to the highest point of that land. Iron pipes should not be used, if possible; and when the land is very flat, it must be ridged and levelled. From the highest point of the land selected, the liquid must be conducted by open channels or through common drain-pipes laid on to the surface to all the different points where it is wished, and utilized for irrigation. The land adopted should be moderately porous, and then for every 100 people an acre may be allowed, but this varies much according to the nature of the soil. The land must be thoroughly drained and prepared. The best crops to be grown are Italian rye-grass, with alternately crops of vegetables, such as potatoes, cabbages, rhubarb, mangold. All these will luxuriate on the liquid, and we think we may safely say that the command of such liquid would be worth to any person from £5 to £10 an imperial acre, according to local circumstances.

Milch cows thrive remarkably well on this grass, and it has been proved by chemical analysis that the milk is of the best quality, while the vegetables are also quite wholesome.

Could such a system be carried out in the neighborhood of all our large towns, the results would be highly beneficial. The difficulties in the way, principally arising from ignorance on the subject, have been great; but to this system, or something like it, there can be no doubt, before many years, we must come, to prevent pollution of the rivers, and to make the most of the sources of fertility which are at our command, but which we are at present recklessly wasting. Many committees have been appointed by the House of Commons to inquire and take evidence on this subject. In 1857, a commission was issued by the crown to certain gentlemen, at the head of whom was Lord Essex, to inquire into 'the best mode of distributing the sewage of towns, and applying it to beneficial and profitable uses.' This commission went to work principally at Rugby, and have made a vast number of experiments, the general result of which may be stated to be, that ordinarily diluted sewage may be said to produce such increased crops as to warrant an agriculturist in giving one halfpenny a ton for it, a ton of water containing 224 gallons. The third Report was issued in April 1865, and the following recommendations are given as the results of their labor:

'1. The right way to dispose of town-sewage is to apply it continuously to land, and it is only by such application that the pollution of rivers can be avoided.

'2. The financial results of a continuous application of sewage to land differ under different local circumstances; first, because in some places irrigation can be effected by gravity, while in other places more or less pumping must be employed; secondly, because heavy soils (which in given localities may alone be available for the purpose) are less fit than light soils for continuous irrigation by sewage.

'3. Where local circumstances are favorable, and undue expenditure is avoided, towns may derive profit, more or less considerable, from applying their sewage in agriculture. Under opposite circumstances, there may not be a balance of profit; but even in such cases a rate in aid, required to cover any loss, needs not be of large amount. Finally, on the basis of the above conclusions, we further beg leave to express to your Lordships that, in our judgment, the following two principles are established for legislative application: First, that wherever rivers are polluted by a discharge of town-sewage into them, the towns may reasonably be required to desist from causing that public nuisance. Second, that where town-populations are injured or endangered in health by a retention of cesspool matter among them, the towns may reasonably be required to provide a system of sewers for its removal; and should the law as it stands be found insufficient to enable towns to take land for sewage application, it would, in our opinion, be expedient that the legislature should give them powers for that purpose.'

It is obvious, however, to any one perusing the above paragraphs, that they are exceedingly vague, and form but little guide to any one who must go into the question of whether money invested in utilization of sewage-schemes will pay an adequate return upon the outlay. The uncertainty attending the dilution of the sewage; the necessity of making the earth take it at all seasons; the distance that the liquid has to be pumped—have all been such difficulties in the way, that the commission could not well arrive at any other result than they actually did.

Experience has now proved, what was formerly a matter of presumption, that, until we arrive at fixed quantities, no reliable principles can be laid down that would in all cases enable us to overcome the difficulties attending the sanitary management and utilization of sewage.

SEWAGE, LIERNUR SYSTEM OF. The pneumatic system of Captain Liernur for dealing with the sewage of a town has been in operation for some years on the Continent; and Amsterdam, Leyden, Prague, Dordrecht, St. Petersburg, and some other towns, are now either partly or wholly drained on this plan. A town so drained is divided into districts of from 250 to 1000 acres, according to circumstances. Each of these districts is again divided into small sewage areas, varying from 10 to 50 acres, also according to local circumstances. These small areas have each an air-tight cast-iron tank, from which extend along the several streets air-tight pipes of the same material, 5 inches in diameter, and independent of each other. The closets of the houses are connected by branches with these pipes.

An air-pump engine, or more usually two or three of these steam-engines, are placed in some central station, and in the under portion of the building air-tight iron reservoirs are situated, in which a vacuum of about three-fourths atmospheric pressure is maintained. Pipes, also air-tight, and called central pipes, connect these reservoirs with the street tanks. Like the outer series, these are five inches in diameter, and each pipe has two connections with its street tank, by one of which only air can be sucked out; but the other dips into the well of the tank, thus enabling its contents to be removed by suction to one of the central reservoirs. When a vacuum is made in one of the street tanks, the contents of the closet pipes are drawn towards it; and on a second vacuum being created, the charge is drawn into it. This tank is then in due time emptied into a central reservoir by exhausting the air in the pipe connecting them.

We may state here that, although no water is used for flushing, it is found that the fæcal matter is reduced almost from the first to the consistency of thin pulp by the atmospheric pressure. Now as it is impossible to propel liquid any great distance along a horizontal tube simply by air pressure—the air column always breaking through and destroying the vacuum—the pipes require to be set at inclines varying from 1 in 5 to 1 in 250 according to circumstances. This admits of a series of vertical risers being formed from which the liquid matter can never be altogether removed, and therefore these form a complete lock-off of one gradient from another, so that the vacuum cannot be destroyed. The residual liquid in these risers corresponds to the left quantity of water

which a pump can never completely remove from a receptacle. When the apparatus is at rest, this minimum quantity of liquid matter arranges itself partly in the riser and partly in the lower end of the sloping pipe.

To show what takes place when there is a much larger amount of excreta to remove in one direction than in another, we may take the case of two branches from one main pipe each 100 feet long, the gradient 1 in 100, and each having a riser of one foot. One of these pipes may have to deal with a single house producing only one foot of fæcal matter; the other may be connected with a barrack producing 100 times as much. 'We have, therefore, in the barrack pipe a mass filling both pipe and riser, and ready on the slightest force to discharge into the main or street pipe. On the other hand, in the branch pipe of the single family, there is the minimum quantity collected at the foot of the riser. The sucking action is now put in operation in the main pipe. The pressure of the atmosphere begins to act, and the barrack pipe rapidly discharges into the main pipe, while the smaller quantity is simply climbing up the riser, and before it has got to the top of the riser to be in a position to discharge, all the surplus quantity in the barrack pipe is gone, and that which is left is simply equal to that minimum which cannot be withdrawn. In this way the fullest pipe always begins to discharge first, the next more full waiting for it, and so on, until the minimum is reached, when simply air breaks through.'

During the day the air-pumps maintain a vacuum in the central reservoirs and throughout the whole extent of the central pipes connected with them. Patrols of two men each visit the district tanks, one of whom, by opening a valve, makes a tank communicate with the central pipes, and so exhausts the air from it. He then shuts the valve, and the second man immediately opens another which allows the vacuum to act on one of the street pipes and its branches. A second, third, and fourth street pipe is dealt with in the same manner—the vacuum meanwhile being frequently renewed in the tank—till all the sewage in a district is collected and transferred to a central reservoir.

The pneumatic system of Liernur admits of ordinary water-closets being used. As, however, the water has afterwards to be got rid of, he prefers, on the score of economy, a form of closet devised by himself which is used without water. It has no movable mechanism at all. The space into which the excreta falls is one arm of a short bent tube or siphon trap discharging into a soil-pipe. Each new deposit by its own weight forces out the former one, and there are special arrangements for the ventilation of the closet.

Captain Liernur aims at making the sale of the fæcal manure cover the working expenses of the system. The process, or at least one process, by which he converts the sewage material into a marketable manure, is as follows, leaving out some of the minor arrangements for saving heat. Mixed with a little sulphuric acid, it is placed in a large boiler through which pipes pass, and through these pipes waste steam, after being superheated, circulates, by which a rapid boiling takes place. The material is afterwards transferred to a trough in which a long hollow drum of thin metal, heated internally, revolves. The drum takes up and dries a thin layer of the manure, which is scraped off by a fixed knife and sold under the name of *poudrette*. It contains from 7 to 10 per cent. of ammonia; and it is affirmed that this method of converting the liquid manure into a dry powder is highly remunerative.

We need hardly explain that wherever the Liernur system is adopted, the mere water-drainage such as that required for rain, waste water of houses, and the like, is provided for by separate drains formed of earthenware pipes, but of much smaller size than in cases where all kinds of sewage pass through them. Existing sewers in a town may of course be used for this purpose.

The details of the Liernur system have been so recently brought to much perfection, that we shall probably have to wait for some years yet before any decided opinion can be formed of its merits as compared with other methods of treating sewage. As yet no sanitary engineer has adopted it in England even on a small scale, but if it succeeds on the Continent no doubt any existing prejudice against it will soon be overcome.

SEWAGE EARTH-CLOSET. In addition to the arrangements noticed under SEWAGE, and under LIERNUR SYSTEM on previous page, for getting rid of excreta, there is partially in use an *earth-closet*, in which the powerful deodorizing and other properties of dry earth are taken advantage of to deprive refuse of offence or harm, and to retain it in a fit condition for agricultural use. There are numerous forms of this kind of closet. Perhaps the simplest kind is that which consists of nothing more than a seat and a pan, the latter being lined round with earth by the help of a movable central mould or core. More convenient forms consist of a pail or a square-shaped pan on wheels under the seat and an earth box rising above it at the back. The box may be made to hold as much earth as serves for twenty or thirty sittings. By one of several devices in use, a valve is opened at the bottom of the earth-box, which allows the proper quantity of earth to descend through a spout and cover the deposit. The mechanism of one kind is such that the seat descends with the person, thereby bringing a charge of earth to the bottom of the spout, and when he rise it is dropped upon the fæces.

The earth-closet system is, of course, scarcely practicable in large towns, as it would be very difficult to plan an economical arrangement by which the large quantities of earth required could be carried to and fro. But it is in use in many villages, and in some large isolated buildings, such as jails and hospitals. It has been much adopted in India, where, owing to the warmth of the climate, the rendering of fæcal matter innoxious from the first must give it a peculiar advantage. It also appears to have been tried on a considerable scale in America; and a competent authority there reports, that 'experience has taught that its power for usefulness is restricted by the difficulties involved in procuring, preparing, and removing the dry earth required in its use, and to some extent by those which attend, mechanically and chemically, the application of the earth to the dejecta. The inherent defects of the earth-closet reside in the seeming impossibility of obtaining just such perfection of mechanism as will completely do the required work automatically. It should never operate by weights, which act badly, and interfere with the space beneath.' In America it seems to be believed that the earth-closet will before long undergo great improvements, and play an important part in sanitary problems. In England during recent years it has received little attention compared with other systems of dealing with sewage.

SEWARD, WILLIAM HENRY, American statesman, was born at Florida, New York, May 16, 1801, of Welsh and Irish descent. His father was a physician and merchant, who, after accumulating a moderate fortune, was appointed judge of one of the inferior courts. S. entered Union College at 15; in 1819, he visited the south, and was engaged for six months as a school teacher in Georgia. Called to the bar in 1822, he settled at Auburn, Western New York, and became the partner and son-in-law of Judge Miller. In 1825, his political abilities were manifested in an oration delivered at Syracuse, and in 1828 he was chosen president of a state convention. At this period, New York was the center of a wide-spread excitement against Free-masons, and S., as a leading anti-mason, was elected to the state senate. In 1833, he visited Europe, and wrote a series of letters, which were published in the *Albany Evening Journal*. In 1834, he was a candidate for the office of governor of New York, but was defeated by the democratic candidate. About this time he received the lucrative appointment of agent of the Holland Land Company, which gave him wealth and influence. In 1838, he was elected governor of New York. In this position, he recommended the increase of education, internal improvements, a liberal policy toward foreign immigrants, and took the side of abolition in the growing controversies on slavery. In 1849, he was elected to the senate of the United States, where he became the acknowledged leader of his party, and in the debate on the admission of California he promulgated what was called his 'higher-law' doctrine, in saying that there was 'a higher law than the Constitution which regulated the authority of Congress over the national domain—the law of God, and the interests of humanity.'

In a speech at Rochester, N. Y., in 1858, he declared that there was 'an irrepressible conflict between opposing and enduring forces,' and that 'the United States must become either entirely slave or entirely free.' In 1859, he revisited Europe, and extended his tour to Egypt and the Holy Land, and in 1860 was the most prominent candidate of the republican party for nomination for the presidency, but personal and local interests finally secured the election of Abraham Lincoln, while Mr. S. accepted the important post of Secretary of State, in which he guided the diplomacy of the Federal government through the perils of the War of Secession with an almost unparalleled industry, energy, and success. On the 14th of April 1865, as the war approached its termination, and while S. was confined to his room by a fall from his carriage, President Lincoln was assassinated by John Wilkes Booth, an actor at a theater in Washington. At the same time, another assassin, named Paine, penetrated to the room of Mr. S., dangerously wounded his son, and with a piognard inflicted wounds upon him which were at first believed to be fatal, but from which he slowly recovered, and continued in office, as Secretary of State for Foreign Affairs, throughout the presidency of Lincoln's successor, Andrew Johnson, when he conducted the negotiations by which the United States purchased from Russia those territories in North America which are now called Alaska. S. resigned his office in 1869, on the accession of President Grant. In the autumn of 1871, he went on a foreign tour through Southern Europe, Turkey, Palestine, Egypt, India, China, and Japan, and was everywhere received with much distinction. S. published speeches and orations in 4 vols., a Life of John Quincy Adams, and a Life of De Witt Clinton. He died in October 1872.

SEWING-MACHINE, one of the most important inventions of this century. Like the stocking-frame, which in principle it closely resembles, we owe it to the ingenuity of a poor mechanic, striving to lessen the labor which he saw was a real hardship upon his wife and other poor women. Elias Howe, a native of Massachusetts, surrounded by a young family, for whom he was obliged to labor during the day, devoted his after-hours to the construction of a sewing-machine. This was about the year 1841, and his career since that period up to the present time forms a striking chapter in the annals of intelligent labor, and furnishes another proof of the saying that 'fact is stranger than fiction.' After incessant labor, during the latter part of which he and his family were indebted to a friend for the means of subsistence, he completed the first working sewing-machine, the patent for which was granted to him in May 1841. He did not succeed in inducing the people of his own country to see the value of his patent, and came to England, where, after patenting it here also, he met with so much discouragement that he sold the patent for £250 and a royalty of £3 per machine to a staymaker, Mr. Thomas of Cheapside, London, who used it successfully in his own business, but did so little towards making it public that for several years its existence was only known to a very few individual manufacturers. When Howe reached his own country again, he found his American patent pirated by a wealthy company; but with admirable spirit he asserted his rights, and succeeded in establishing them; and it is gratifying to know that his talent, industry, and perseverance were rewarded, for he became a wealthy man.

Howe's machine worked what is called the lock-stitch, but since his invention became known, numerous improvements and modifications have been introduced by other inventors. The principal of these are as follows: 1. *Machines which sew with one thread;* of which one kind makes the *through-and-through* or *shoemaker's stitch* (fig. 1), the thread being held and pushed through

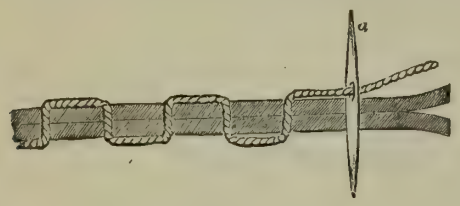

Fig. 1.

with pincers, one pair on each side of the material to be sewn. The needle, *a*, is pointed at each end, and being pushed through by the pincers on one side, is taken hold of by the corresponding pair on the other, and the thread is thus pulled through backwards and forwards. Only a small length of thread can be used by this machine, hence it is of but limited application. 2. Another single-thread machine makes the *running-stitch* (fig. 2). In this, the

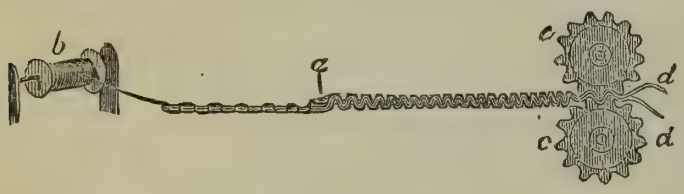

Fig. 2.

needle, *a*, is stationary, and receives a continuous supply of thread from a reel, *b;* the two small-toothed wheels are so arranged, that their teeth, pressing into one another, crimp the two

Fig. 3.

pieces of cloth, and push them forward against the point of the needle, which, as it gets filled, is relieved by the operator, who keeps drawing the sewn cloth off at the eye-end of the needle. This machine answers admirably in cases where loose tacking is required. It is the invention of an American of the name of Bostwick, who introduced it into England in 1844. 3. The *chain* or *tambour stitch* is also a single-thread stitch (fig. 3), the machine for which was invented by M. Thimmonier, a Frenchman, in 1848. In this, the thread is looped upon itself by means of a curved shuttle after it has passed through the cloth. This kind of stitch, though very useful for some kinds of work, is easily pulled out. 4. Fig. 4 represents Wheeler and Wilson's sewing-machine, another American invention, which has acquired the greatest reputation in Great Britain. It is a double-thread machine, and besides the vertical eye-pointed needle, has a curved shuttle or hook (fig. 5, *a*) working below, with a revolving reel, *b*, inside its curve. The reel is of metal, each side being convex externally; and so adjusted on the axle, that the edges are so near together as to

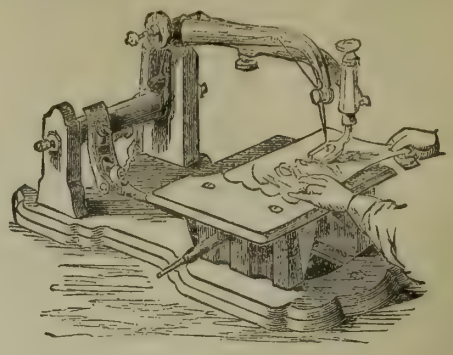

Fig.

admit only one thickness of the thread to pass through (fig. 6). The side view of the whole arrangement is seen in fig. 7. It fits easily within the nearly circular hook, and gives off its thread as required. The thread passes partly round the outer edge of the hook upon a slightly-grooved bevel (*a*, fig. 7), which forms a loop, and passes it between the needle and the thread which it carries

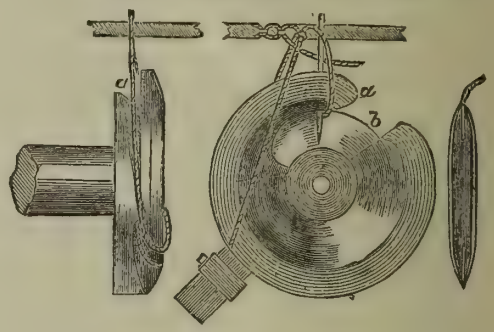

Fig. 7. Fig. 5. Fig. 6.

with it in descending; the loop is held in position as the needle ascends, and the cloth being moved on, the next descent of the needle takes it through the loop and receives another below it, which renders the first one tightly-locked, as in fig. 8. For such

Fig. 8.

work as male and female dressmaking generally, this kind of machine is at present unrivalled, both for the efficiency of its work, and also for the neatness and finish of the machines made for private use. Sewing-machines have beeen patented in America and England by another American named Blake for sewing the soles on boots and shoes; and so rapid are they in their work, that it is said during the war in the United States as many as 150 pairs of soles have been sewed on army boots in one day by a single machine. Special sewing-machines are also in use for sewing the upper leathers of boots and shoes, for gloves, for embroidery, and various other purposes.

SEXAGE'SIMA SUNDAY (Lat. *sexagesima*, i. e., *dies*, the sixtieth day), the second Sunday before Lent, and roughly reckoned the 60th day before Easter.

SEXAGE'SIMALS, a mode of arithmetical calculation introduced by the ancient Greek astronomers, especially by Ptolemy (q. v.) into astronomical and geometrical reckoning. It was founded upon the division of the circle into 360 parts, and the radius being nearly $\frac{1}{6}$th of the circumference, was considered to contain 60 of these parts or degrees. Continuing the same mode of subdivision, each degree (°) on the radius was divided into 60 minutes (′), each minute into 60 seconds (″), and thirds (‴), fourths (⁗), &c., followed in the same relation to each other. Addition and substraction are not altered in this method, but multiplication, division, and the extraction of roots are so to a considerable extent. Multiplication, the most used of these three operations, was carried on in the descending scale, as in the following example.

where $\lambda\alpha^{o}\ \delta'\ \kappa\zeta''$ is to be multiplied by $\kappa\theta^{o}\ \iota\eta'\ \nu\delta''$, or (substituting Arabic numerals) 31° 4′ 27″ by 29° 18′ 54″.

31°	4′	27″		
29°	18′	54″		
899°	116′	783″		
	558′	72″	486‴	
		1674″	216‴	1458⁗
899°	674′	2529″	702‴	1458⁗ = 910° 56′ 21″ 6‴ 18⁗

Here, each of the three numbers, 31, 4, 27, is multiplied by 29; the same three by 18, and the results placed in the line below, one step to the right; and again by 54, and the results placed another step to the right. This arrangement proceeds on the principle that the product of degrees by minutes gives minutes; of minutes by minutes, seconds; of minutes by seconds, thirds; and, in general, the denomination of a product is indicated by the sum of the marks superposed on the two factors. The columns are added and rearranged by Reduction (q. v.) This system, though clumsy and intricate, was a great improvement, as regards facility and accuracy, on the former Greek method; and so much was it admired, that succeeding geometers founded on it a complete system of general calculation, and a work on sexagesimal computation was written by Barlaam, who died in 1348.

It is almost unnecessary to state, that the terms minutes, seconds, thirds, &c. here employed only denote sixtieths, sixtieths of sixtieths, &c., and *have no other signification*; further, that the degrees, minutes, and seconds in the multiplier are, for the time being, merely abstract units and parts of units. The operation of modern arithmetic known as *duo-decimal multiplication* is effected in the same way, the subdivisions being twelfths in place of sixtieths.

SE′XTANT, an instrument for measuring the angular distance of objects by means of reflection. The principle of its construction depends upon the theorem, that *if a ray of light suffer double reflection, the angle between the original ray and its direction after the second reflection is double of the angle made by the reflecting surfaces.* Thus let A and B (fig. 1) be two mirrors perpendicular to the same plane, and inclined to each other, and let SA be a ray of light, which falling upon A is reflected on B, and reflected in the direction BC, then ACB is the angle between the original and finally reflected rays, and ADB is the angle between the mirrors. Now, as the angle of reflection is equal to the angle of incidence $\angle SAF = \angle BAD$, and $\angle GBA = \angle DBC$; but $\angle EBC = \angle BAC + \angle BCA = (\angle BAD + \angle DAC) + \angle BCA = (\angle BAD + \angle SAF) + \angle BCA = 2\angle BAD + \angle BCA$; and $\angle EBC$ also $= \angle EBD + \angle DBC = \angle EBD + \angle GBA = 2\angle EBD = 2\angle BAD + 2\angle BDA$; therefore $\angle BCA = 2\angle BDA$, which proves the truth of the theorem. The instrument of which this theorem is the principle is a brass sector of a circle in outline; the sector being the sixth part of a complete circle, for which reason the instrument is called a *sextant*. Fig. 2 shows the essentials of its construction, AMN is the sector whose curved side, MIN, is the sixth part of a circle; A is one mirror wholly silvered, placed perpendicular to the plane of the sector, and on, and in line with, the limb AI, which is movable round a joint at or near A; B is the other mirror, also perpendicular to the plane of the instrument, and silvered on the lower half only, the upper half being transparent; E is an eyelet-hole or small telescope.

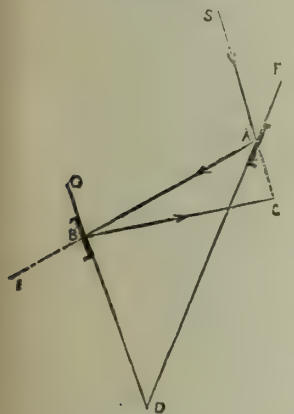

Fig. 1.

The graduation runs from N to M (on a slip of silver, platinum, or gold let into the rim), and is so adjusted that when the movable limb is drawn towards N till the mirrors A and B are parallel, the index, which is carried at the foot of the movable limb is opposite zero on the graduation. If we suppose that this zero-point is at N, it is evident that the angle between the mirrors is equal to the angle NAI; and again, if instead of graduating from 0° at N to 60° at M, which is the proper graduation for the sixth part of a circle, the graduation be made from 0° to 120°, that is, each half degree being marked as a degree, and similarly of its aliquot parts, then the angle NAI, read off by the index at I, will show at once the angle between the incident and finally reflected rays. The mode of using the sextant consists in placing the eye to the telescope or eyelet-hole, and observing one object directly through the unsilvered part of B, and then moving the index till the image of the other object, reflected from A upon the silvered part of B, coincides with, or is opposite to the first object, then the angle, read off at I, gives the angle between the objects. For additional accuracy, a vernier is attached to the foot of the movable limb.

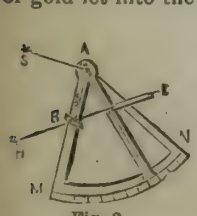

Fig. 2.

The sextant is capable of very general application, but its chief use is on board ship to observe the altitude of the sun, the lunar distances, &c., in order to determine the latitude and longitude. For this purpose, it is necessary to have stained glasses interposed between the mirrors A and B, to reduce the sun's brightness. These glasses (generally three in number) are hinged on the side AM, so that they may be interposed or not at pleasure. B is the glass through which the horizon is perceived, and has hence received the name of the *horizon-glass;* while the other mirror, from its being attached to the index-limb, is called the *index-glass.*

The sextant is liable to three chief errors of adjustment; 1° if the index-glass be not perpendicular to the plane of the instrument; 2° if the horizon-glass be not perpendicular to the plane of the instrument; and 3° if, when the mirrors are parallel (which is the case when a very distant body, such as the sun or moon, is observed directly through B, and found to coincide with its image in the lower part of B), the index does not point accurately to 0°; this last is called the *index-error*, and is either allowed for, or is remedied by means of a screw, which moves the index in the limb AI, the latter being stationary. The first two errors are also frequently remedied by means of screws working against a spring, but in the best instruments the maker himself fixes the glasses in their proper position.—The *quadrant* differs from the sextant only in having its arc the fourth part of a circle, and being consequently graduated from 0° to 180°; the *octant* contains 45°, and is graduated from 0° to 90°; while the *repeating-circle*, which is a complete circle, is graduated from 0° to 720°. A common form of the sextant is the 'snuff-box' sextant, which is circular in shape, and as it can be conveniently carried in the pocket, is the form most frequently used by land-surveyors.

The idea of a reflecting instrument, on the principle of the sextant, was first given by Hooke about 1666; but the first instrument deserving the name was invented by John Hadley (q. v.) early in the summer of 1730, and a second, and much improved form of it, was made by him a short time afterwards. Halley, at a meeting of the Royal Society, claimed for Newton the priority of invention; and in October 1730, a Philadelphian, named Godfrey, also asserted his claim as the original inventor, but that learned body decided that Newton's claim was unsupported by even probable evidence, and that Hadley's and Godfrey's inventions were both original, but that the second form (which is almost the same as the common sextant now employed) of Hadley's instrument was far superior to his first form and to Godfrey's.

SE′XTON (corrupted from SACRISTAN, q. v.), is a parochial officer in England, whose duty is to take care of the things belonging to divine worship. He is usually chosen by the inhabitants, but often also by the minister or the churchwardens, the mode of appointment being regulated by the custom of each parish. He sometimes also holds the office of parish-clerk. Women have occasionally been appointed sextons, this being one of the offices which women may fill, and they also have a vote in elections. The office is a freehold office for life, except in the new parishes under Church-building Acts; the duty is to keep the church clean, swept, and adorned; to open the pews; to make and fill up the graves; to prevent any disturbance in church. The salary is paid by the churchwardens, and as to amount depends on custom. In Scotland, the beadle performs similar duties, and is appointed by the heritors.

SE′XTUPLET, in Music. When a note is divided into six parts instead of the usual division into four—as, for instance, a minim into six quavers, or a crotchet into six semiquavers—the group is called a sextuplet, and the figure 6 is generally placed above it. The proper sextuplet is composed of three groups, of two notes each, being, in fact, a Triplet (q. v.), with each of its notes subdivided into two :  . But a group composed of two successive triplets is sometimes, though not very correctly, also called a sextuplet, and written as such, though it is more correct to divide it into its component two triplets, thus :  .

SEYCHE′LLES COCOA-NUT, or DOUBLE COCOA-NUT (*Lodoicea Seychellarum*), a palm, of which the fruit has some resemblance to a cocoa-nut, although it belongs to a different tribe of palms, being allied to the Palmyra Palm. It is found only in

the Seychelles Islands; and the fruit, wafted by the winds to the shores of the Maldive Islands, or found floating in the Indian Ocean, was long the subject of many ridiculous fables, and is still an object of interest and curiosity, and as such one of the minor articles of commerce. The tree grows to the height of 50 or 60 feet, with a tuft of immense leaves. The wood and the leaves are used for a variety of purposes, like those of other palms. The 'cabbage' or terminal bud is eaten. The fruit is often a foot or a foot and a half long, in shape like a melon, its outer husk green. the interior near the base divided into two parts, at first filled with a white sweet jelly, which changes into a white horny kernel. The shells are used for making vessels of various kinds, often beautifully carved and ornamented.

SEYCHE'LLES ISLANDS, situated nearly in the center of the Indian Ocean, between 3° 40′—5° 35′ S. lat., and 55° 15′—56° 0′ E. long., a group of more than thirty isles, resting on an extensive bank of sand and coral, and forming the most important of the dependencies to the colony of the Mauritius. The principal are Mahé, Praslin, Silhouette, La Digne, Curieuse, St. Anne, Aux Cerfs, Frégate, Marianne, Longue, and Du Sud Est. Mahé, the most considerable and populous of the group, and the seat of government, is 18 miles long, and from 3 to 5 broad. The islands are mountainous, often rising abruptly from the sea, and are clothed with the most luxuriant verdure; one of the peaks, named Mont Blanc, in Mahé, attains an altitude of 3000 feet. The principal port is Victoria, on the north-eastern side of the island of Mahé, the houses of which used to be built chiefly of wood; but now coral is universally employed. Coral is growing very rapidly all round this group of islands. At Port Victoria, where the soundings were recently given at 7 fathoms, the coral has piled itself up to within 2¼ fathoms of the surface. In the neighborhood of Port Victoria there is a beautiful church built of coral. Many improvements have been made also in others of these small islands.

The S. were known to the early Portuguese navigators, who bestowed on them the titles of Isles de Mascarenhas; subsequently, the French renamed them Iles La Bourdonnais, and finally changed their appellation in honor of the Count Herâult de Seychelles. They were first settled by the French in 1756, who commenced the cultivation of spices, under circumstances so favorable as to induce a belief in a lucrative competition with the more easterly colonies of the Dutch. The immunity of the S. from the hurricanes which periodically visit the neighboring seas rendered them peculiarly suited for this purpose, which, however, received a severe blow by the suicidal destruction of the spice-plants by the French occupants, to prevent their falling into the hands of the English in 1778. The cultivation is now checked by insufficiency of labor. On the cession of Mauritius, the S. were finally taken possession of by Great Britain. The islands produce a large quantity of timber suitable for ship-building purposes; and the S. cocoa-nut, which is indigenous only in the S., and the nuts, leaves, &c. of which are applied to a great variety of domestic purposes by the natives. Sugar is cultivated to a small extent. Cotton flourishes here, but its cultivation has declined since the abolition of slavery. The chocolate plant and vanilla are grown, and tortoise-shell is among the articles of commerce.

The population of the S. was, in 1881, about 12,000 souls, many of whom are employed in the ship-building yards and factories.—See Sir Edward Belcher's *Account of the Seychelles;* Owens's *Voyage of H.M.S Leven and Barracouta;* Horne's *Report on the S. Islands* (1875); *Nature*, vol. xiv.

SEYMOUR, FAMILY OF. This family, whose history is largely interwoven with that of England, was originally settled at St. Maur—whence its name—in Normandy. Coming over to England, the Seymours obtained lands in Monmouthshire as early as the beginning of the 13th century. They acquired estates at Hatch Beauchamp, Somersetshire, by marrying an heiress of the Beauchamps early in the 15th century. In 1497, we find the head of the family, Sir John Seymour, employed in suppressing the insurrection of Lord Audley and the Cornish rebels, and subsequently accompanying King Henry VIII. to his wars in France, and to the Field of the Cloth of Gold. Of the issue of this worthy knight one daughter became the wife of Henry VIII., and mother of Edward VI.; one son, Thomas, created Lord Seymour of Sudeley, became Lord High Admiral of England, and the second husband of Henry's widow (Catherine Parr), and ended his life on the scaffold, being attainted to high treason. Sir John's eldest son, Edward, who held many high positions in the court of Henry, was created Lord Seymour of Hache, and Duke of Somerset in 1546—1547. He had been sent into France by Henry to settle the disputed question of the border of the English possessions there, and secured the confidence of the king so far, that he was left by him one of his executors and one of the council of the young Prince Edward. He was subsequently made Lord High Treasurer, and eventually 'Protector and Governor of the King and his realms.' (See EDWARD VI.). His subsequent fall, after a two years' tenure of his all but regal power, by the influence of Dudley, Earl of Warwick and Duke of Northumberland, was followed by an attainder of his honors, which was not reversed for more than a century.

The eldest son of the Protector by his second marriage, being created by Elizabeth Earl of Hertford, married the Lady Catharine Grey, a grand-niece of Henry VIII., sister of the unfortunate Lady Jane Grey—a marriage which entailed on him a long imprisonment and a heavy fine. His grandson, who succeeded him in the Earldom of Hertford, was also sent to prison in the Tower of London for marrying the Lady Arabella Stuart, cousin of James I. of England; but subsequently, playing a conspicuous part in the royal cause in the civil wars, obtained in his own favor a reversal of his ancestor's attainder (see above), and in 1660 took his seat in the House of Peers as second Duke of Somerset, although the descendants of the first duke, by his first marriage, were then in existence. He died in 1675, and his ducal title passed to a cousin, on whose death it was inherited by Charles Seymour, known in history as the 'Proud Duke of Somerset,' a nobleman whose style of living was ostentatious and haughty in the extreme, and who filled several high posts in the courts of Charles II., William III., and Anne. He married the heiress of the Percies, by whom he had a son, Algernon, 7th duke, who was created Earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, the ancestor of the present Percy line. On the death of this duke, a curious peerage case arose, the title being claimed by the descendants of the first duke by his first marriage, on the failure of the younger branch; and the attorney-general having reported in favor of the claim, Sir Edward Seymour took his seat in the House of Peers as 8th Duke.

SEYNE, LA, a seaport of France, on the shore of the Mediterranean, in the dep. of Var, three miles south-west of Toulon. Pop. (1876) 8152.

SE'ZZE, or SEZZA, a city in the province of Rome. There are remains of a Cyclopean wall surrounding the rock on which it stands. Pop. 6600.

SFAX, or SFA'KES, the chief town and port of Southern Tunis, 150 miles south of the town of Tunis, with which it is connected by telegraph. There is a trade in dates, cloth, olive-oil, esparto grass, and jessamine and rose oil. Pop. 40,000, of whom 2000 are Jews.

SFORZA, a celebrated Italian family, which played a most important part in the affairs of Italy during the 15th and 16th centuries, swayed the destinies of Northern Italy for many years, and allied itself with the first sovereign houses in Europe. Its founder was a peasant of Cotignola, in the Romagna, by name *Giacomo*, or *Muzio* (sometimes combined by historians into *Giacomuzzo*) *Attendolo* (born 1369), who deserted his trade of wood-cutting to become a 'condottiere,' and by his intelligence and courage rose to a high position in the band to which he belonged. Count Alberigo de Barbiano, the founder of Italian 'condottierism,' bestowed upon him, on account of his prowess, the name of SFORZA (Ital. 'the forcer'); and such was his reputation among his comrades, that he speedily found himself the independent leader of a band of condottieri, and offered his services to the king of Naples. Queen Joanna II. made him constable of that kingdom, and in exercise of his office, he chased away the Aragonese, and others, who attempted to deprive her of her dominions; but dying soon after (4th January 1424), he left his devoted followers to the chieftainship of his natural son, FRANCESCO S., then 23 years of age, who was as brave and enterprising as himself.

Francesco, as was the custom of the time, sold his sword to the highest bidder, and without the slightest scruple fought for or against the pope, Milan, Venice, and Florence. He invented an improved system of tactics, and it soon came to be taken for granted that victory was certain for the party which he supported. It was thus no great act of condescension in the Duke of Milan, the haughty Visconti, to confer upon him the hand of his daughter, Bianca, with Cremona and Pontremoli as a dowry, and the promise of succeeding to the duchy itself. Meantime, S. took the march of Ancona from the pope (1434), added to it Pesaro (1443), and by a judicious combination of force and stratagem, obtained his elevation to the dukedom of Milan (26th February 1450), after the decease of his father-in-law. He solidly established his authority over all Lombardy, and several districts south of the Po; acquired the esteem of Louis XI., who gave up to him Savona and Genoa; and after gaining the universal love of his subjects, died 8th March 1466. Though uninstructed, he possessed considerable eloquence, and loved and protected letters. The successors to his power possessed few or none of his distinguished talents. His son, GALEAZZO-MARIA S. (1466—1476) was a true tyrant, gloating over the torments of his victims, and a monster of debauchery, prodigality, and ferocity, without a single redeeming feature in his character. He was assassinated (26th December) at the porch of the cathedral of Milan. His son GIOVANNI-

GALEAZZO S. (1476—1494) succeeded, under the regency of his mother, Bona of Savoy, who held the reins of government with a firm hand. But she was forced to give up (1480) her able co-adjutor, Simonetta, to the vengeance of her brother-in-law, Lodovico Maria, surnamed 'the Moor,' from his dark complexion; and three days after Simonetta's execution, the ambitious Lodovico banished herself, and assumed the regency. Finding the young duke in his way, Lodovico put him and his wife, Isabella of Calabria, in prison, and was immediately threatened with attack by the king of Naples, a danger which he attempted to ward off by giving his daughter, Bianca, with a dowry of 400,000 ducats, to the emperor Maximilian I., and by stirring up Charles VIII. of France to assert his claims to Naples. Soon afterwards, Duke Giovanni-Galeazzo died, poisoned, as some believe, by his uncle, 20th October 1494.

LODOVICO-MARIA (1494—1500) obtained his investiture as duke, and becoming alarmed at the rapid progress of the French in Italy, he joined the league against them, and was rewarded for his perfidy by being driven from his duchy, which was seized by the troops of Louis XII. (1499). The following year he made an ineffectual attempt to regain possession, was made prisoner, and carried to France, where he died in 1508. He possessed great talents, combined unfortunately with a low morality, which led him to value astuteness more than everything else; but his encouragement of letters and of the fine arts, will preserve his name to posterity. His eldest son, MASSIMILIANO S. (1512—1515), regained the duchy of Milan after the reverses suffered by Louis XII., and with the aid of the Swiss steadily repulsed the various energetic attempts of the French to recover it; but after the battle of Marignan (1515), he abandoned his rights to the French for a pension of 30,000 ducats, glad to be free from the insolence and exactions of his allies, and the attacks of his enemies. His brother, FRANCESCO-MARIA S., succeeded nominally to the Milanese after the battle of Pavia, but he was a mere puppet in the hands of Charles V., and on his death, 24th October 1535, and the extinction of the main line of the house of S., the duchy was quietly swallowed up by Austria. The Lords of Pesaro (extinct in 1515), the Counts of Santa-Fiora, in Tuscany, still existing, and the Dukes of Sforza-Cesarini, descend from collateral branches of the family.

SFORZA'TO (Ital. forced), in Music, often contracted *sf*, a term used to indicate that the note over or under which it is placed is to be played with strength and emphasis. A higher degree of emphasis is indicated by *sff*, or *sforzato assai*.

SHAD (*Alausa* or *Alosa*), a genus of fishes of the family *Clupeidæ*, differing from *Clupea* (the Herring, &c.) in having the upper jaw deeply notched. The teeth are very small, on the jaws only, and often wanting, at least in the adult fish. The species are numerous, inhabiting the sea, but some of them ascending rivers like the salmon, and spawning there. They are very like herrings in form and appearance, and on this account, and their large size, the British species receive from Scottish fishermen the name of *King of the Herrings*. The herrings of extraordinary size, of which the capture is sometimes reported are probably always shad.—The COMMON S., or ALLICE S. (*A. communis*), is rather thicker and deeper in proportion to its length than the herring. It is found on the British coasts, and in the lower part of some of the large rivers, more abundantly in the Severn than in any other British river. It attains a length of two, or even three feet, and a weight of from four to eight pounds. It has no teeth. There is a single black spot behind the gills. Its flesh is of good flavor.—The TWAITE S. (*A. finta*) is more plentiful on the British coasts, and is the common S. of the Thames, but the foul state of the river has now made it of very rare occurrence above London. It is smaller than the Allice S., seldom exceeding 16 inches in length; there are small teeth in both jaws, and a row of dusky spots along each side of the body. The flesh is coarser, and less esteemed than that of the Allice S , but much used for food wherever the fish is plentiful. This species spawns later in the year than the last, and in order to permit it to deposit its spawn, its capture in the Thames is prohibited after the end of June. It abounds in many of the rivers of France, and other parts of Europe.—A species of S., generally weighing about four or five pounds, but sometimes twelve pounds, is very abundant during some months of the year in some of the North American rivers, as the Hudson, Delaware, Chesapeake, and St. Lawrence, and is now bred successfully, and in immense numbers, in the U. S. pisicultural establishments.

SHA'DDOCK (*Citrus decumanus;* see CITRUS), a tree, which, like the other species of the same genus, is a native of the East Indies, and which has been long cultivated in the south of Europe. It is said to derive its English name from a Captain Shaddock, by whom it was introduced into the West Indies. It is readily distinguished from most of its congeners by its large leaves and broad-winged leaf-stalk; it has very large white flowers, and the fruit is also very large, sometimes weighing 10, or even 14 pounds, roundish, pale yellow; the rind thick, white and spongy within, bitter; the pulp greenish and watery, subacid, and subaromatic. It is a pleasant, cooling fruit, and much used for preserves. The tree is rather more tender than the orange, but with proper care is often made to produce fine fruit in orangeries in Britain.

SHADOW is a portion of space from which light is debarred by the interposition of an opaque body. If the luminous body be too near, or too large to be considered as a mere point, then each atom of the light-giving surface throws its own shadow independent of the others. We have thus in reality a multiplicity of shadows overlapping each other, and forming what in common parlance is 'a' shadow of the opaque body, which is darkest at those places where all the separate shadows overlap each other, and becomes lighter as it gradually falls beyond the limits of more and more of these separate shadows. See PENUMBRA. The depth of a shadow depends from mere force of contrast on the intensity of the light around it; it also depends much on the nearness of the object, as compared with its size, to the surface upon which the shadow is thrown; for the rays of light by their properties of reflexion, refraction, and dispersion tend to bend 'round' the opaque object, and the increase of distance between an object and its shadows allows more scope for this action.

SHADWELL, THOMAS, a dramatic writer of some note in his day, though now only remembered as the 'Mac-Flecknoe' of Dryden's satire, was born in 1640 in Norfolk. He was educated for the law, but not finding it a pursuit to his mind, he deserted it, and after an interval of foreign travel, betook himself seriously to literature. His first comedy of *The Sullen Lovers* (1668) had great success, and he continued from year to year to entertain the town with a succession of similar pieces, a complete edition of which was published after his death in 4 vols. 12mo. The immortality which these must have failed to achieve for him, he was fated to attain in a way somewhat less desirable. With Dryden he seems, in the earlier portion of his career, to have been on terms of friendly intimacy; but literary jealousies divided them, and the quondam friend became a favorite butt for the shafts of Dryden's deathless ridicule. Though his works—hasty and careless as they are—exhibit lively talent and considerable comic force, all that the literary world now knows of S. is, that 'Shadwell never deviates into sense.' It might a little console him, under the satire of his enemy, that he succeeded him in the post of poet-laureate, which in 1688 it became necessary for Dryden to resign. He did not long survive to enjoy it, however, as in 1692 he died, it is said of an overdose of laudanum, a drug in which he was wont to indulge himself.

SHA'FIITES, the name of one of the four principal sects of the Sunnites (q. v.), or 'orthodox' Muslims. Its name it received from its founder, Abu Abdallah Mohammed Ibn Idris, called Al-Shafei, from one of his ancestors who descended from Mohammed's grandfather.

SHAFT, the body of a column, extending between the base and capital. In Gothic architecture, the term is applied to the small columns clustered round piers, or in the jambs of doors and windows. In the early styles, the shafts are frequently of finer material than the pier, such as Purbeck marble, and polished and banded. In later examples, the shaft is generally attached, and of the same piece as the pier. For illustration, see COLUMN.

SHA'FTESBURY, commonly called SHASTON, a very ancient town of England, a municipal and parliamentary borough in Dorsetshire, 27 miles north-north-east of Dorchester. It stands on the narrow ridge of a chalk hill, and commands extensive and beautiful views of the counties of Dorset, Somerset, and Wilts. The date of its foundation is unknown, but it seems to have been a Roman station. In the reign of Athelstan (924—940) it contained two mints and an abbey of Benedictine nuns. Here Canute the Great died in 1036. Pop. (1871) of municipal borough, 2472; (1881) 2312

SHAFTESBURY, ANTHONY ASHLEY COOPER, EARL OF, English stateman and philanthropist, is descended from a family intimately associated with the political history and literature of England. Sir John Cooper of Rockbourne, Hampshire, married Anne, daughter and sole heiresss of Sir Anthony Ashley of Wimborne, St. Giles, Dorsetshire, secretary-at-war in the reign of Queen Elizabeth. Their eldest son, Sir Anthony Ashley Cooper (born 1621), was actively engaged in public affairs during the civil wars. He first espoused the cause of royalty; he then became one of the most eminent of the Parliamentary leaders in the council, and not the least active in the field. When he saw that the restoration was inevitable, he took so prominent a part in bringing back Charles II. that he was raised to the peerage as Baron Ashley. He was a member of the justly infamous 'Cabal' Ministry, and was afterwards appointed to be Lord Chancellor, with the earldom of Shaftesbury. He was the Achitophel of Dryden, by whom his character is drawn with as much truth as power. He hated a calm, lived all his life in intrigues, and in his 62d year

his 'fiery soul' wore out his small and fragile body. He will be honored for all time by men of English race and descent as the author of the Habeas Corpus Act. He also first introduced a bill rendering the judges independent of the crown.—His grandson, ANTHONY COOPER, third earl (born 1671, died 1713), author of the *Characteristics*, the friend of Pope, and the other celebrities of the Augustan age, obtained from Voltaire the questionable praise of being the boldest of the English philosophers.—The sixth earl was for many years Chairman of Committees of the House of Lords.

His son, ANTHONY ASHLEY COOPER, seventh earl of S., was born in Grosvenor Square, London, April 28, 1801. He was sent to Harrow, and thence to Christ-Church, Oxford, where he obtained a first-class degree in classics in 1822. He represented the borough of Woodstock from 1826 to 1830; the county of Dorset (in which the family estates are situated), from 1831 to 1846; and the city of Bath from 1847 to 1851, when he succeeded to the earldom. During his long career in the Lower House, he held one or two subordinate posts. He is better known by his attempts to improve the social condition of the laboring classes. As he belonged to the Conservative party, and represented an agricultural county, the manufacturers, and their organs in the press, received his allegations respecting the condition of their operatives in a hostile and antagonistic spirit, and retorted that the wages of families engaged in factories amounted to twice and three times the sum paid to the Dorsetshire laborers. Yet Lord Ashley returned again and again to the charge; and on the death of Mr. Sadler, M.P., took charge of the Ten Hours' Bill. The manufacturers declared with alarm that any reduction in the hours of labor would be fatal to our manufacturing supremacy. Successive governments naturally believed these prophecies, and almost all the leading statesmen of the day opposed the Ten Hours' Bill. But public opinion declared in favor of a limitation of the hours of labor. Lord Ashley carried his bill through parliament, and has the satisfaction of knowing that the opponents of the measure admit, without an exception, that it was an act of wise and beneficent legislation, and that their alarms were groundless. When he visited the manufacturing districts, he was honored with an enthusiastic ovation. He refused to join Sir R. Peel's administration in 1841, because that statesman refused to countenance the Ten Hours' Bill.

In 1846, he supported Sir R. Peel in his proposal to repeal the Corn Laws, an act which cost him his seat for Dorsetshire. When he successfully contested Bath against Mr. Roebuck in 1847, he appeared on the field of politics as a 'Liberal Conservative.' After his accession to the earldom, S. took a more prominent part in connection with various religious, social, and philanthropic societies. These are so numerous that a list of the associations with which he is in some way officially concerned, would include almost every scheme having for its object the physical, moral, and spiritual improvement of society. He belongs to the Evangelical party in the Church of England, and is a prominent member of the chief church societies. He is married to a daughter of the fifth Earl Cowper, and being thus a connection by marriage of the late Viscount Palmerston (whose government he steadily supported), many of the ecclesiastical appointments and promotions of Evangelical clergymen made by that minister were attributed to his influence. He has followed up the Ten Hours' Bill by obtaining the assent of parliament to other measures regulating defective workshops and factories, night-work, and the treatment of children by their employers. Among honors that have been conferred on S. are the Oxford Degree of D.C.L. in 1841, and the honorary citizenship of Edinburgh in 1878.

SHAG. See CORMORANT.
